The weak points of the present system.—I believe I am quite correct in stating, that in our heavy land districts only 50 acres out of every 100 are available to produce food for man or profit to the farmer. Full 20 acres are consumed by the farm horses, 25 acres in long fallows growing nothing, but involving an outlay of nearly 5*l.* for each acre, and from five to ten acres occupied by banks, ditches, and farm buildings, leaving the tenant the produce of from 45 to 50 acres to pay all charges on 100 acres. I think it is high time such a system should be altered; that by perfect drainage, economy of manure, and superior cultivation, 12 acres should keep the horses, and all the rest (save the homestead and an external iron or wooden boundary fence) be available for corn or roots. That this is perfectly practicable is proved in Lincolnshire, parts of Scotland, and other highly cultivated districts. It is an easy and profitable way of adding 40 per cent. to our territory without the cost, cruelty, and trouble of conquest, military protection, or migration, with the still more pleasing reflection of not having to rend asunder those kindly ties of home, affection, and friendship, the want of which is bitterness in the cup of many an honest emigrant. With regard to fences, there appears a sort of veneration for them entirely unaccountable. I object to them *in toto*, except such as are of wood or iron. The banks on which they stand are privileged receptacles for every description of noxious weed, insect, bird, and vermin. Unhoed, unploughed, they furnish an annual crop of seed-weeds, carried by winds and by birds on the land, that defies all the farmer's attempts to clean it; that renders long fallowing necessary, and involves a perpetual expense in hoeing, and loss by superseding so much of the regular crops. In fact, in a variety of ways they involve a loss far beyond the annual interest, for the repair of wood or iron fences, or charge for their gradual deterioration. I object even to well-regulated thorn fences, on the score of exhaustion by their roots, the expense of clipping, and the impossibility of disturbing the ground on which they stand. But my dislike amounts to positive indignation at seeing the generality of fences occupying one-tenth of the land that should grow our food, and employ our labour and our capital, spoiling another tenth by their supply of weeds and vermin; their interruption of air and light—to say nothing of the facilities they afford for fraud and neglect of duty, and the difficulties they interpose to a ready supervision by the farmer or his bailiff. If shelter is needed at particular seasons, it can readily be afforded by other means. In cold and elevated districts, well-regulated plantation-belts are essential, but cannot be required in our midland and southern counties, where there should be well-arranged homesteads, through which no north or east wind should be permitted to breathe—much less blow.

Another gross oversight is in the placement of buildings. How often is profit unwittingly sacrificed to minor considerations! To gain the view of a road, or because the premises would show better, we starve our cattle with a north or east aspect, shutting out the sunny warmth. Gutters to the buildings or drainage to the yard itself are seldom thought of, it being a *sine quâ non* that a farm-yard should be both cold and wet.

There are many other matters that strike me as requiring amendment. Time is money (at least it is paid for in money), therefore light spring carts and improved implements, with active but strong horses, will necessarily make quick smart men; but this cannot be till we drain our lands, knock down our fences, and substitute dry firm land for knee-deep muddy lanes. If, as a matter of calculation, there are 40 points in Agriculture (and there are more) a saving of one-half per cent. in each will clearly make a difference of 20 per cent.

I have been found fault with for removing the trees, "spoiling the landscape and beauties of the country," as if farming were not a business, and carried on for profit rather than appearance: one might almost as properly suggest to the manufacturer costly and spacious ornaments to take the place of his spindles and machinery. Besides, perfect drainage of house, buildings, or land, is impossible where you have trees and fences; their roots will travel many yards in search of moisture, will seize on and occupy a drain (as a Vine-root would on a bone), and effectually choke it. I know an instance where the root of a Pear-tree followed the retreating water of a well 40 feet.

I have been censured for erecting so spacious a barn, and for building it with bricks on the plea of its endangering the sample in a damp season. This objection is untenable, the roof having gutters, and the ground on which it stands being perfectly drained inside and out, a matter of great importance, as water rises by capillary attraction. We have also about four dozen of iron air-bricks as ventilators, and take care not to fill it entirely, but leave a space for ventilation between the corn and the roof. Last season, with its contents of twenty-five acres, the sample was excellent, and having just hastily filled it before that heavy rain which wetted most of the stacks through, and deteriorated the samples five shillings a quarter, it saved us at least 20*l.*

Threshing machines are valued principally for their facility of conversion, and the quantity they perform. To me their more perfect extraction of the grain, and prevention of fraud or neglect, are far more important considerations. A single grain of wheat in fifty is two pounds in every hundred, or five shillings per acre, and an examination of straw whenever we have the opportunity, gives us fearful evidence of what is lost by imperfect threshing and shaking.

I frequently see with pain the farmer engaged in laborious pursuits (the work of his labourers), when his time should be much more profitably employed in keeping correct and daily accounts of all his monetary and other transactions, so that, by a reference to each particular department, he could at once detect generally, or in detail, the weak points that require amending.

I am not one of those who think a farmer more likely to succeed for dressing or acting like one of his common labourers—it is the mind and calculation makes the man.

The Non-application of Capital to Land Improvements.—It seems singular that in this age of superabundant capital and superfluous unemployed labour, there should never have been a concentration of wealth for the purpose of improvement in Agriculture. We have had companies with unlimited capital for the wildest and most unprofitable schemes, as well as the most trivial. We lend without compunction our hundreds of millions to employ the labour and strengthen the hands of foreign nations, who are now our competitors in Agriculture, commerce, and manufactures, and who may be to-morrow our greatest enemies in warfare. It seems like a national disgrace, that whilst we have had companies for almost everything, from a railway to a steam-washing and milk company, we have had no "Improvement of our Native Land Company." And yet there is nothing so grateful as the soil—so safe—so permanent—so large in pecuniary amount—so honourable and pleasant in pursuit.

There may appear difficulties in the way—but in what undertakings are there not? Under a well-arranged Act of Parliament, thousands of landlords whose mortgaged estates are now almost an incumbrance to them, would readily avail themselves of an opportunity that would render their sterile lands valuable properties, increase the capital employed on them, improve the condition and diminish the competition of our farmers, reduce pauperism and discontent by furnishing employment to the willing labourer without emigration, and keep in our own country and for our own benefit that large sum annually paid for foreign corn. If there had been such a company, I, for one, would have invested my spare capital in it; but there not being one, I have carried out individually, at no small personal trouble and thought, those improvements which I hope to see some day effected, as a matter of course, by a well-regulated charter of associated capitalists, who will derive not only a good pecuniary benefit, but the more enviable gratification of having conferred a valuable boon on their fellow countrymen.—*I. J. Mechi, 4, Leadenhall-street, London.*

P.S. I am preparing drawings and ground plans of my buildings and machinery, which, with copies of my letters, I shall be happy to give to any gentleman interested in agriculture. The plans and designs are my own. The general application of the expenditure is as follows:—

Draining, fencing, levelling, ditching, and roads	£2200	0	0
Barn, stabling, tanks, sheds, yards, &c.	2000	0	0
House and offices	1000	0	0
Machinery, implements, steam apparatus, &c.	500	0	0
Manure, marl, &c.	500	0	0
	£6200	0	0

The item for house has been objected to, but I have yet to learn that a farmer is not entitled to be as well housed as a tradesman or manufacturer, and I am convinced brick and slate buildings are ultimately much cheaper than board and thatch. I would caution gentlemen who may visit my farm this year, against raising their expectations too high, for although the land is all cropped and doing well, considering the dry season, I would have them remember that last year it was considered the poorest farm in Essex; that since January 1843, we have cut 80 miles of drains, and spread their contents (nasty yellow stiff loam) on the surface; that we have removed 5000 yards of banks and fences, filled up the ditches, cut new ditches (on the heavy land there should be one every seven or eight acres), made new roads, cut down and converted between 200 and 300 trees, carted across the land 60,000 bushels of stones, 300,000 drain-pipes, 400,000 bricks, 200 loads of timber, slates, iron, stone, sand, lime, and building materials; that we have removed all the old buildings, and erected new ones on a different site; that everything has been out of order and out of time, and that all this was done in sixteen months, without long fallowing a single field.

ON MINERAL AND INORGANIC MANURES.
No. XX.

BY PROFESSOR CHARLES SPRENGEL.

(Continued from page 415.)

THE main requisite is to mix the clay and loam intimately with the soil, the reasons of which have been stated under the head of marl. However little difficulty there may be to mix loam with the furrow-slice, it is different with clay, on which account the former is always preferable, especially if marshy soils are to be manured. The surest way to succeed with clay is to use only small quantities at once; if, therefore, 300,000 lbs. are intended for one acre, it is best to take only 100,000 lbs. every five or six years. It must always remain spread on the surface of the field during winter, as the absorbed and then frozen water will best convert it into a powder. If, however, humic earth is to be had, nothing better can be done than to mix it with the clay or loam before they are used in alternate layers in large heaps, to let them remain so for some time, and to work it up once or twice, by which the clay will be loosened and so more easily mixed with the soil. By these means a soil sufficient in humus will be supplied with that amount of humic acid which is required for decomposing the silicates of the clay. In some places clay or loam is also put into heaps in alternate layers with manure; but in order that both these substances may become thereby mixed, the heaps must be left standing at least a year, and worked up during this period several times. In other places they construct of the loam, intended to improve the fields, a wall three feet high around the dung sink; on the top of this wall is a gutter, in which at times the superfluous liquid is poured. In this way the liquid manure is consumed, and after the lapse of a year an earth is obtained, which being saturated with many powerful ingredients, will act very powerfully; still, it is to be remembered, that as the loam is deficient in humus, much ammonia will always be volatilised.

Fields which have been manured with loam or clay, and have borne one crop, are generally left afterwards for pasture, as time will effect the mixing much better than the most careful work. Loam contains mostly more soda, potash, gypsum, common salt, &c., in the lower strata than in the higher ones, and it is better to use the former; on this subject, however, nothing but a chemical analysis can yield certain data. Clay, on the other hand, does not contain in its lower strata any more of the easily soluble mineral substances, as the water cannot filter through them.

Manuring with Loam and Clay in a Roasted State.—A long experience has proved, especially in Ireland and Scotland, that the manuring properties of loam and clay are considerably increased, if exposed previously to the action of fire. The advantage which this operation will produce with a good material and in appropriate localities, is striking; and it has even gone so far, that some have asserted, that manuring with burnt clay renders manuring with dung superfluous. Although this assertion is not borne out by fact, still it cannot be doubted that by roasted clay or loam one substance is conveyed to the soil, which is a most important ingredient of dung, viz. nitrogen. Because, if a loam or clay is roasted, which contain already protoxide of iron or manganese, or in which these substances are formed during burning from the oxide of iron or manganese, ammonia will be formed the moment that water and the nitrogen of the atmospheric air have access, as the protoxides of iron and manganese decompose the water and combine with its oxygen into an oxide, by which the hydrogen will be set free, which will then unite with the nitrogen of the air into ammonia, the latter being either condensed in the pores of the clay, or received by the moisture which is at hand. That this process really takes place, I have found by many experiments, on which account I recommend that sort of clay or loam for roasting which are rich in iron or manganese. A calculation made by me shows, that if the clay or loam used for the manuring of one acre contains 1000 lbs. protoxide of iron or manganese, there is a possibility that 100 lbs. of ammonia will be formed, which (as we know already) will produce a great effect. It might be believed, that the above two protoxides, which will be conveyed by the roasted clay into the soil, will rather injure than benefit vegetation, but this is not the case, as both will lose by heat the property of being easily dissolved in either carbonic or humic acid. Roasting has, more-

over, another essential use, viz. that of loosening the silicates contained in the loam or clay, by which they become more easily soluble in carbonic or humic acid, and converted into vegetable nourishment. The more silicates, therefore, the clay or loam used contains, the greater will be the utility of roasting. From what has been said it will be seen that a soil, to be benefited by the application of roasted clay, must not be deficient in humic acid, which has partly to transfer the bases of the silicates into the plants, and partly to neutralise and chemically bind the ammonia which will be formed in the clay. If, therefore, the manuring with roasted clay has not turned out well in all places, it was caused either by the clay not possessing enough iron, manganese, or silicates, or by the soil being deficient in free humic acid. The effect of roasted clay will be, moreover, the greater, the more gypsum, common salt, and phosphoric salts it contains, as those substances (independently of its other component parts) are most powerful nutriments of plants.

Loam or clay which are to be exposed to the action of fire must be always of that compactness that the lumps will not crumble to pieces during burning, else fire could not properly act throughout them. The roasting is either performed in a sort of a funnel-shaped oven, built for the purpose on the grates on which the clay is placed, and fire made underneath, or it may be put in high heaps, with wood, peat, and such like, which are then lighted. If ovens are used for roasting, the lumps of clay which are biggest and have most consistency are placed first on the grate, and the smaller ones on the top; the whole, however, must always be built up very loosely, so that the heat and smoke of the fuel, be this wood, thorns, peat, &c., can pass to the uppermost layer. The different contrivances for burning clay are to be found in my work on Cultivation, to which the reader may refer.

SKETCHES OF EAST LOTHIAN HUSBANDRY.

(Farm-yard Dung, *Continued from page* 415.)

Some of the most intelligent farmers in the county dung considerable portions of their fields, intended for Beans and Turnips, on the stubble, immediately before giving it the winter furrow; and this practice appears to be fast gaining ground. The soiling of working horses in the stables, on green Clover and Rye-grass, during the summer months, is common in most parts of the county, and a similar mode of fattening cattle for the butcher is also becoming pretty general. The Grass for the latter is cut and given to them in the fold-yards, with a small allowance either of oil-cake or Bean-meal. The advantages of this method of summer feeding are numerous and apparent; but, perhaps, the chief benefit of soiling arises from the large quantity of excellent dung thereby produced. All the dung thus made during the summer months is, in most instances, applied either as a top-dressing to Vetch-land designed for Wheat, or spread upon the stubble and ploughed in with the winter furrow in order to clear the yards for their winter occupants.

The great advantages of winter dunging are, that it economises time when the season of more active labour comes on, and that the dung is thereby better incorporated with the land than it could be when applied with drill crops. Steep hilly fields, intended for green crops in the following year, are almost invariably dunged on the stubble (whenever dung is given); the cartage being then much more easily effected and with less injury to the land than at any subsequent period. In the case of Bean-land, the whole allowance of manure is commonly given before the first ploughing, but when the field is designed for Turnips, only half the intended quantity is at that time applied; when the seeds are being sown, the remainder of the dung is given in the ordinary way; or, what is now very common, instead of dung, a small quantity of bone-dust, rape-dust, or guano, is added at seed-time. A fair average allowance, per imperial acre, seems to be from 10 to 12 loads of dung ploughed in with the stubble-furrow, and 3½ cwt. to 4 cwt. of rape-dust, or about 6 bushels of bone-dust, given when sowing the Turnip-seeds. When the dung laid on the stubble is not sufficiently fermented, a little boy attends to each plough for the purpose of clearing the irons when entangled with the rough dung, so as to get all of it completely covered in. This is a point of much consequence with most of the farmers here.

Farm-yard dung is applied to the land while undergoing the process of summer-fallow, or as a manure with Beans, Potatoes, Turnips, or other green crops; when used with drilled crops, the carts are driven along the intervals, and the dung pulled out into small heaps 6 or 7 yards asunder, by a man specially appointed for that purpose, and provided with a dung-drag. In East Lothian, where economy appears to be the perpetual watchword of every farmer, it is customary to have a few boys for leading the horses from the dung-heap to the drills; a man drags out the dung, according to the quantity to be applied, and the boys return with the empty carts. Much attention is now everywhere bestowed upon the equal distribution of the dung in the drills. The spreading is always done by women; three drills are taken together, a woman to each, and the steward or some careful person goes behind them in order to correct any defects in the spreading. When the drills are very long, and the work going actively forward, it is usual to have two parties of spreaders, commencing at opposite ends of the drills, and meeting about midway. Most of the farmers are very solicitous to have the dung covered in as soon after spreading as possible, in order to prevent its evaporation; and in warm, sunny weather none is left uncovered, either spread, or in heaps between yokings, or during the time allotted for rest.

The quantity of farmyard dung applied with the different crops varies, of course, according to the quality of the land, and the whole stock of manure at the farmer's command. In former times 20 to 24 double loads were by no means an uncommon allowance; but this valuable substance is now much better economised. The practice of the best farmers is to give a liberal but limited quantity frequently, not saturating the land at one time with manure, and neglecting it for many years afterwards, but to maintain a uniform or increasing fertility in the soil. For common Turnips, 12 to 14 loads, of about 18 cwt. each, is the quantity generally given per acre. Potatoes and Swedish Turnips commonly receive a few loads additional, say 15 to 17 cart-loads per acre.

Lime.—An abundant supply of limestone is amongst the natural advantages possessed by East Lothian for successful agriculture. What is termed the mountain limestone abounds in many parts of the county, particularly in the parishes of Dunbar, Preston-Kirk, North Berwick, and Salton, where kilns for burning it are kept going during certain periods of the year. The quantity of lime formerly used in this shire was very considerable, it having been found of the greatest efficacy on the strong clayey land; it is employed now only to a very limited extent compared with what was formerly used. More than one-half of the kilns are at present idle, very few of the farmers applying lime in any considerable quantities to the land. This, doubtless, arises from the circumstance that land once thoroughly limed (as every farm here has been) derives comparatively little advantage, and may possibly be injured from further application of this valuable substance, for a considerable period after the first dose.

Lime is usually conveyed from the kiln to the fields during the months of July and August; or between the completion of Turnip sowing and the commencement of the harvest operations. It is applied to land at all stages of the rotation; but it is during the season in which it is in fallow that lime can be used with the greatest advantage. Sometimes it is applied to the Turnip-crop, in which case it is either spread upon the land and harrowed in before forming the drills, or applied at a subsequent period, when the operations of the horse-hoe and drill-grubber necessary for the crop sufficiently incorporates it with the soil.

The usual mode of managing lime is as follows:—When conveyed from the kilns to the field to which it is to be applied, it is laid down in small heaps at regular intervals, and immediately covered with earth; a gradual slacking speedily commences, and the stones soon crumble down into fine powder; after which it is spread upon the land and ploughed in with a shallow furrow. On heavy soils 90 to 100 bushels of newly-calcined lime are reckoned a moderate dose per acre; on lighter soils a less; and in very stiff clays a greater quantity is generally applied.

Composts.—Lime is now principally used in mixtures with earthy or vegetable substances. The Quickens or Couch-grass collected off the land while in fallow or preparing for fallow crops, are in most cases heaped up in some convenient corner of the field, where they are allowed to remain for a few years, until their strong vegetative powers are nearly destroyed, and then compounded with a good proportion of hot lime. Composts thus formed are found to be a valuable top-dressing either for Grass or arable land. Lime is mixed up with waste, earth-scourings of ditches, scrapings of road-sides, &c. In addition to the compost-heaps thus formed in the fields, others are also formed in convenient spots near the farm-steading, to which the cleanings of the poultry-house, scrapings of roads, coal-ashes, and offal of every description are regularly taken.

Sea-weed.—The farmers along the coast from North-Berwick eastward, avail themselves of the large quantities of sea-weed or sea-ware, (Algæ marinæ) driven ashore during the winter and spring months. It is considered a very useful species of manure for the light dry soils adjacent to the coast, but is not found advantageous on clays. Sea-ware is immediate, but transient in its effects; seldom lasting for a longer period than a single crop. It is applied to the land as fresh as possible, being always spread upon the field when brought from the sea, and is used at all times in which it can be obtained. It has invariably been found highly efficacious as a top-dressing to Grass lands, and also as a manure for Potatoes, but the crop, though bulky, is generally inferior in quality; sea-ware is seldom mixed with other substances.

Bone-dust.—Large quantities of this valuable substance have long been employed with the best effects in this county, for the manuring of Turnips on light dry soils, to which it seems best adapted. The quantity of bone-dust annually used has considerably decreased within the last few years, in consequence of the introduction of guano, and other fertilisers. The bones are allowed to undergo a slight degree of fermentation before being applied. For this purpose they are made up into a heap in some convenient spot about the steading or the stack-yard, and covered with straw. The addition of a small quantity of water during dry weather accelerates their fermentation. The only crop to which bone-dust is here applied, is Turnips; when used unmixed with any other substance, the quantity usually given is two quarters per acre. But bone-dust is now very frequently combined with other manures, such as farm-yard dung, rape-dust, &c.; mixing it with finely-sifted coal-ashes, and allowing the mass to ferment, appears to be a most judicious and economical plan. The bones are scattered along the hollows of the drills by the hand, the women employed at the work carrying a small quantity in their canvass aprons, and a boy attends to supply them with bones when required. The drills are not formed as deep for bone-dust, as when farm-yard dung is applied. An apparatus attached to the Turnip-sowing machine is used in some places for depositing the bones while sowing the seed, but this double machine is not much employed. Some farmers are now beginning to sprinkle the bone-dust before using it, with dilute sulphuric acid; and a few are this year trying the solution of bones in sulphuric acid, which has produced such astonishing results in other districts. The price of bone-dust is here, 2*s.* 4*d.* to 2*s.* 6*d.* per bushel of about 47lbs.

Rape-dust.—This is another species of manure very much used in this county. It is applied with advantage to almost every crop, but is considered to be best adapted to Turnips. When used with this crop it is commonly mixed with bone-dust, as has been already mentioned, or with farm-yard dung, guano, gypsum, &c. When used alone, 8 to 10 cwt. is the quantity usually applied to the acre. Rape-dust is frequently employed as a top-dressing to Wheat lands, in which case it is scattered upon the surface while sowing the seed, and covered in by the harrows. It is considered to be better suited to strong, stiff soils, than to those of a light, dry, and friable quality. Its price is 5*l.* 10*s.* per ton: a bushel weighs about 52 lbs.

Guano, although but recently introduced into East Lothian husbandry, is now very extensively used as a manure for Turnips and Potatoes, and also, though to a less extent, as a top-dressing to Grass lands and corn-crops. It appears from the results of the various trials which have been here made with it, that genuine guano is a most powerful fertiliser. In applying guano to the Turnip-crop, it is always strewed along the hollow of the drills immediately before sowing the seed; the drills are then reversed in the same manner as when dung is used, and the seed sown by the Turnip-sowing machine. A similar mode of application is generally pursued in the case of Potatoes, and the sets planted in contact with the guano. I am aware that many intelligent men recommend the interposition of an inch or so of soil between the guano and the sets, and that some writers on this manure even maintain that it should never be applied in immediate contact with any seeds. It may be useful, however, to state, that so far as I am aware no such precaution is observed by the generality of East Lothian farmers. Indeed, I personally witnessed several acres of Potatoes as well as Turnips manured by guano last year, and the sets were planted on the manure precisely as in the case of dung. In one instance of a Potato-crop manured in this way by guano, the quantity of Potatoes obtained from the lot to which guano was applied, was very nearly double the produce of a similarly-sized lot manured by the usual quantity of well-fermented farm-yard dung. The quantity applied was 3½ cwt. to the acre, the soil a strong clay, thorough-drained. This experiment, to be afterwards noticed, came under my own observation; I can, therefore, vouch for its authenticity.

Guano is this year applied to a very considerable extent in the manuring of Potatoes and Turnips, and so far as can be yet judged from the former crop, with success. Before using this manure it is finely sifted, and all the lumps well broken and re-sifted. When used alone, the usual quantity applied is 2 cwt. to 3 cwt. per acre for Turnips, and from 3 to 4 cwt. for Potatoes. Price 11*l.* per ton.

Gypsum.—This substance has been, but is not now, much used as a manure in this county. The crops to which gypsum is applied are Turnips and Potatoes. It is also used as a top-dressing to Clover and Corn crops. When used for Turnips or Potatoes it is generally combined with other manures, such as guano, rape-dust, &c., and when applied to Corn-crops it is either scattered upon the surface and harrowed in with the seed in the same manner as rape-dust, or sown at a subsequent period. Moist weather is, of course, preferred for applying gypsum. The quantity usually given when used alone is 2½ to 3 cwt. per acre. Some farmers in this quarter are now beginning to strew a little gypsum on the farmyard dung while being turned over, before using, and a few also sprinkle the stable-floor with it every morning after being cleaned. Potato sets are now generally powdered over with gypsum before planting. Price 3*l.* per ton; weight per bushel, 94 lbs.

Nitrate of Soda.—Until the introduction of guano, nitrate of soda engaged much attention, and was supposed to possess very strong fertilising properties. Although not so much employed now as formerly, it is still applied to some extent principally as a top-dressing to Corn-crops presenting a weakly stunted appearance. It is also occasionally applied to Grass lands. The quantity commonly used is 1 to 1½ cwt. per acre. Its high price, 20*l.* per ton, is an obstacle to its extended use. Besides the different species of manures now enumerated, there are several others, such as soot, nitrate of potash, muriate of soda, sulphate of soda, and sulphate of magnesia, occasionally used. They are not, however, employed in any considerable quantities, and the results of the applications which have been hitherto made with them, have been generally contradictory and indecisive.—*T. Sullivan.*

POTATO STARCH.

Of all the starch-bearing plants, the Potato is that which affords the greatest quantity of produce from a given surface of land. The different varieties of Potato differ, however, very much; and the following table will indicate exactly the circumstances of the most important kinds. The plants were grown all on the same

quality of land, and the analyses are by Payen, the eminent French Agricultural chemist.

Varieties.	1 cwt. seed produced.	1 statute acre produced.	100 parts contained		
			Water	Starch.	Gluten & Fibre.
Rohan . .	58 cwt.	14½ tons.	75 2	16.6	8.2
Large Yellow .	37 ,,	9½ ,,	68.7	23.3	8.0
Scotch . .	32 ,,	8 ,,	69.8	22 0	8.2
Slow Island .	56 ,,	14 ,,	79.4	12.3	8.3
Legonzac . .	32 ,,	8 ,,	71.2	20.5	8.3
Siberian . .	40 ,,	10 ,,	77.8	14.0	8.2
Duvillers . .	40 ,,	10 ,,	78.3	13.6	8.1

These results show that the quantity of starch is not largest necessarily in those varieties which yield the greatest weight of tubers. Thus an acre of large yellow Potatoes, which gives but 9½ tons of tubers, produces 2 tons 3 cwt. of starch, whilst the acre of Slow Island Potatoes, which produce 14 tons of tubers, gives only 1 ton 15 cwt. of starch. In cultivating the plant for the purpose of extracting this material, it is therefore of the greatest importance to attend to the existence of these varieties.

The preparation of starch from the Potato is an operation of a very simple kind, and well adapted for the industry of the smaller towns, where Potatoes would be usually cheap. It requires only the most ordinary skill, and involves little machinery, the greatest nicety in it being perfect cleanliness, and care that the washings be well finished, and with pure water. The operations of the manufacture are—1st. Washing the tubers; 2d. Rasping them to a pulp; 3d. Pressing the pulp; 4th. Washing the rough starch; 5th. Draining and drying the produce. 6th. Bolting and storing.

Of these operations it is only necessary to notice one or two in detail.

The breaking up of the tubers into a pulp is accomplished by means of cutting cylinders, to which the Potatoes are supplied from a hopper, nearly as grain is to a mill. The more rapidly the cutters move, the finer is the pulp produced, and the more perfect the subsequent extraction of the starch, and hence they generally make 600 to 900 turns in the minute, and as these cylinders are usually about 20 inches in diameter, their periphery moves with a velocity of from 1000 to 1500 yards in a minute. A single cylinder of the above dimensions and of 16 inches long, making 800 revolutions in a minute, will reduce to pulp about 50 bushels of Potatoes per hour. This for the 12 working hours is about 10 tons.

The object of pressing or sifting the pulp is to separate the fecula from all foreign substances, especially from the cellular tissue, which, being coarser, rests on the sieve through which the fine starch passes. A great variety of mechanical arrangements have been constructed for this purpose, which fulfil their object, but there remains always with the residual pulp two or three per cent. of the fecula which it is impossible to obtain.

The starch, diffused in the current of water by which it has been washed out from the pulp, is run into vats, where it gradually settles. When the water has become quite clear, it is poured off, and fresh water put on: finally, the starch is taken out and dried on floors. As it consolidates into very firm masses, it requires finally to be broken down by a kind of bolting machine, before being put up for sale.

It is necessary to add some valuation of the money circumstances of this manufacture. An acre of Potatoes, very well manured, and on good land, may be considered to produce nine tons of Potatoes, which may be taken as worth 15*l.* From such Potatoes, it may be expected that, with proper care, 15 per cent. of pure starch may be extracted, and hence, from the 9 tons, 27 cwt. The market price of the Potato starch is variable; it has been 30*s.* per cwt., but it only on rare occasions falls below 20*s.* Taking it at 20*s.* the value of the produce of the acre becomes 27*l.*, leaving for cost of manufacture and profit 12*l.* and of this certainly a large proportion should be profit. I do not think I value the Potatoes too low, as, of course, the manufacturer, if not himself the grower, would purchase for store at proper seasons, and avail himself of the lowest terms.

But this calculation of advantage supposes the starch to be the only valuable matter extracted from the Potato, which is far from being the case. The residual pulp, which, when perfectly dry, amounts to about five per cent. of the entire weight of the tubers, has been found a most nourishing food; in fact, it contains most of the nutritious part of the root, the mere starch which was removed being comparatively much less important in nutrition. This pulp, if moist, putrefies rapidly, it is rich in nitrogen, and in fact analogous to animal substances in composition, and consequently, if not required for food, would form, by being made with lime and clay into a compost, a manure of great value, and especially suitable for restoring to the Potato ground the substances which the crop in growing had removed. The waters, with which the pulp is first washed, dissolve a quantity of the soluble constituents of the Potato. They rapidly putrefy, and exhale an odour so rotten as to have rendered the starch factories near Paris a nuisance to the neighbourhood, until it was suggested to employ this water as a manure, which has been perfectly successful, and at once removed an important draw-back to this branch of industry, and materially increased the fertility of the surrounding farms.

If these residues be properly economised, it is evident that the cost of growing the Potatoes may be materially diminished. The atmosphere, in itself, furnishes in fact the carbonic acid and water from which the starch is formed, and if the matters taken from the soil in each crop, be returned to it in the residues of the manufacture, the cost of manure, so heavy for this particular plant, may be almost entirely obviated.

In this country, where the extensive use and culture of the Potato have become almost a national characteristic; where labour not requiring considerable skill is to be had so cheap; where Potatoes are at their minimum price; it is not merely to be regretted but absolutely disgraceful to ourselves, that we import from Scotland and from France, a large quantity of the Potato starch to be consumed in Ireland.

The starch is not the only material extracted from Potatoes, and extensively available in the arts. The Potato itself reduced to flour, is at present extensively employed upon the Continent in the preparation of a very wholesome quality of bread, and the starch itself is consumed in making confectionary, jellies, sago, tapioca, in thickening paper, and in a variety of uses, by which such quantities of it are employed as to render its manufacture a really important and extensive department of industry. The most remarkable of all the applications of Potato starch is, however, one to which the excise laws of this country would probably present invincible impediments. It is the preparation of sugar and of spirits. Under the influence of certain chemical agents, simple, yet peculiar in their action, and to which it would not be my province here to refer in detail, starch is converted into sugar, and this sugar, by fermentation, yields spirits. On the Continent the manufacture of sugar from corn is almost abandoned. Potato spirit is almost universally used; and in flavour it so resembles brandy that it is well known that a large quantity of the French brandy brought into London, is Potato spirit from Hamburgh coloured with burned sugar.—[From Professor Kane's lately published work, *The Industrial Resources of Ireland.*]

For the information of the Board of Guardians, I beg to state that the description of Potatoes on which the Pigs were fed the preceding three years of this account, were sold for the sum of 2*l.* 7*s.* 8*d.* annually, and that the swill brought in the sum of 1*l.* per annum: *M. M'Intosh, Master.—Wm. B. Wingate, Guardian, Hareby.*

Steeping Seeds.—As a reader of the *Gardeners' Chronicle*, I have perused Mr. Campbell's account of his "Corn-producing Liquids." If Mr. Campbell will refer to "Ellis's Practical Farmer, or Hertfordshire Husbandman," 4th edition, published 1742, at page 25, he will find the following, which I copy verbatim:—"A prepared Liquor to steep Barley, &c. for sowing.—Take a quantity of the grain you are to sow, a bushel, more or less, and boil it in a copper (to a bushel put five pails-full of water) till the grain bursts, and the water thereby becomes impregnated with the essential salt of such grain; strain your liquor, and give the corn to the poultry; thus there may be no waste. While the liquor is hot, put three pounds of nitre, that it may dissolve, and add four or five pails-full of water which drains from the dunghill, or urine of any sort. And in this prepared liquor steep the grain about 24 hours. Let the liquor be four inches above the corn in the fat (vat?), because the corn will swell and imbibe it. Then take the grain and let it dry in the shade, or sift lime over it, which will dry it sooner, and sow one-third less than usual, and you will assuredly find the benefit by twenty fold; I have actually tried it with Barley, and had commonly thirty ears from one root. The liquor that is left will serve again with fresh addition, or is admirable to water a garden. About three pounds of nitre, as above, is sufficient for as much as will sow an acre or more; and what is left is still the stronger by being the groundwork of the next addition of nitre. You must pour your prepared liquor warm upon the corn, and stop all as close as you can, for this causes the salts to be put in motion. Imbibe the corn one evening and take it out to dry the next, and by morning it will be fit to sow; at the same time you may prepare more corn for the next day, and so on till the season is over. The excellency of this receipt is obvious in several cases. 1. It saves seed. 2. It in some measure supplies the defect of full dressing the land, by the seed being full of riches when sown. 3. It produces greater quantity than ordinary. Lastly, by thus steeping, the grain will make its way out of the ground if drought should succeed; whereas that sown dry, and especially that which lies nearest the surface, will continue sometimes till Midsummer, in a dry summer, before it grows, and thereby often occasions the loss of great part of the crop, for when one part is ripe the other is green at harvest, which was the very case almost all over the nation this last summer, 1731; when I was so fortunate as to sow, for the first time, the Barley after this receipt, which brought my crop up more even than my neighbours, to the admiration of the beholders, and had more on an acre than ever I had; I believe I may say as much again."—*A Welsh Farmer.*

Potatoes.—I have grown Potatoes with many different kinds of manure, both fresh and decayed; I have planted them in deep drills and shallow; I have tried earthing them up, and I have tried them without earthing up; I have used freshly-cut Grass in planting them, and I once had an excellent crop, by merely putting chopped or bruised Cabbage-leaves in the drills with the sets; this last plan I believe to be very beneficial to the crops, more especially in a dry season. But the system I now pursue is one which I have employed many years, and always with a good result. The main point to be attended to for insuring a good crop, must of necessity be the having good and properly-saved seed. My method is this:—At the usual season for raising the Potatoes, I cause them to be ploughed or dug up, and the quantity I reserve for seed is strewed thinly on the surface of the ground, in any shady place; secure, of course, from the invasion of cattle, &c. Here I suffer them to remain exposed to the varied influences of the atmosphere, until they become quite green, and the texture of the Potato perfectly firm, which will commonly be in about three weeks; during this time they require turning occasionally. I pay no regard as to whether the tubers be ripe or unripe when they are taken up, as I consider that the above treatment is an efficient method of ripening or harvesting the seed. When they are perfectly fit to store, I put them in a cool, dry place, covering them with plenty of clean straw; and here they remain till the time for planting arrives. I always, if possible, preserve the first-started shoots, as they grow stronger, and will always produce better crops of large tubers, with fewer small or refuse Potatoes: if the first shoots are destroyed, the succeeding ones are weaker; and consequently can only produce Potatoes in proportion to their strength. As regards planting, I have tried them whole, as well as cut; the former plan I practise in part, but I believe the best plan is, to cut a small piece about the size of a shilling off each seed Potatoe just before planting. (!) I believe this renders them much more prolific; the reason for which I imagine to be, that the old set, by being cut gradually decays, as the plants grow and the young tubers advance in size; whereas the whole sets are much longer in decaying. "J. M'I." prepares his ground well, but I do not agree with his not using the hoe, as I think the use of that implement to be of benefit to every crop. I always use manure when I can procure it, and pay little regard as to quality, but always prefer it when not too much decayed.—*J. L. Snow, Swinton, Bedale.*

Potatoes.—In my communication to you of the 12th inst., I forgot to mention that, agreeably to your wish in a previous Number, I tried the experiment with part of a ridge of early (Fox) Potatoes. I nipped off three joints from the top of the plants, and selected six yards from out of the middle; the result was, that those which were untouched were larger and heavier by nearly one-third, from the same measurement of ground.—*F. N.*

Diseases of Wheat.—Not having as yet seen in your paper any account satisfactory to myself as to the causes of the bunt in Wheat, I beg to offer a few observations which I have noticed for the last two years on my own Wheat, as well as on that of my neighbours, it being now the time of year that your numerous Correspondents have an opportunity of making like observations, and of communicating their experience. If I mistake not, Wheat is an hermaphrodite plant, and of the genus Triticum, class Triandria, order Monogynia. Consequently each kernel of Wheat has three male and one female parts of fructification necessary to the setting of the seed. A few days after a field of Wheat is out of flower you will soon perceive the bunty ears, the kernels of which appear to stand thinner on the stem than the others. Some plants have all bunts, and some partly sound ears and partly bunts; and some ears have good kernels and bunts on the same stem. On examination of the bunty kernel, I find that the stamens and anthers never break through the chaff, but burst inside the chaff, and thus the flowers never receive the influence of the sun and air necessary to the setting of the seed, or necessary to the process of fructification, and thus the seed becomes abortive. Now, if this be the cause of bunts, I am at a loss to understand what effect the dressing of Wheat before sowing, with brine, mercury, lime, &c., can have to prevent this disease. I once knew a field all dressed alike and all sown one day; the field was clear from bunts, with the exception of a strip about six yards through the middle, and that was nearly altogether bunty; this strip was where an old road had once been. I have sometimes attributed this disease to frost or blight, which might have been the cause here, as

very probably that part of the field being stiff and hard, the Wheat was not in flower at the same time as on the other part of the field, and being at a different stage of growth, a frost or blight might have a very partial effect. I hope that some of your Correspondents will make minute observations, and communicate the results for the information of the agricultural public.—*Richard Rilott.*

Diseases in Wheat.—I send you herewith four ears of Wheat taken from a field in the county of Essex, which are seriously affected with disease. You will perceive that more than one-third of the ear (in one case about half) in length from the top is white and dead. The crop from which these specimens were taken was partially affected by the disease, and the owner of it observed other crops in his neighbourhood similarly affected. Is not the whole ear affected by the disease, and may not the white appearance be expected to extend itself over the whole, if it cannot be checked? Probably there are no means of stopping it when once begun, but there may be means of preventing it, and if so, it is very desirable that they should be known. Were the disease at all general in a crop, the effect would be very serious.—*H. F. F.*

[This disease has appeared in many quarters, and it is supposed to be one of the injurious consequences of the long-continued dry weather which we have experienced this year. It is not unfrequently the case that the culms of the ear of Wheat at both its extremities prove abortive, when there is not sufficient nourishment for the plant in the soil, or when, as now, though there may be a sufficiency of nourishment present, a drought destroys the means of conveying it to the roots of the plant.]—— We add as follows from another Correspondent, respecting this disease :—"The field in which the diseased Wheat occurs is in a high state of cultivation ; it was a Clover lea fed off by sheep and pigs all through the summer, which were also supplied from troughs with oil-cake, Beans and Peas. The soil varies ; full one-half of the field is affected as the inclosed ; this has a subsoil of gravel covered by a good mixed rather light soil ; the remainder of the field has a clay or loamy bottom, and on this the Wheat is very luxuriant and entirely free from this unnatural blight." [This appears to be in accordance with the theory which ascribes this disease to the influence of the weather.]

Artificial Guano.—In your paper of 25th May, "W. M., Dimsdale," writes that a compound of urine, sulphate of magnesia, and hydrated lime, is equal to guano and bones ; he states the quantities of urine and sulphate-magnesia in 14 lbs. to 100 gallons, but not of the lime ; I should be glad of information from him, as to whether that should be added in such quantities as to saturate the liquid, and in what quantity would this compound be equal in fertilising strength to guano, and in about what proportions should it be used as a substitute for guano. —*J. Green.*

Rooks.—Your Rook correspondent should inquire of the farmers and labourers of the moorlands of Staffordshire, who are obliged to live upon Potatoes the most part of the year, if Rooks are a benefit to them. They pull the sets out of the ground, and carry them away during six weeks in spring, and if the weather be unfavourable to get them up in the autumn, the Rooks will do it for them.—*F. X. O.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Special Council for the purpose of taking the Prizes for next year into final consideration, agreeably with the Bye-Laws, and appointing the Judges for the Society's ensuing Show of Stock, Implements, &c., at Southampton, in July next, was held at the Society's House, in Hanover-square, on Wednesday last, the 26th of June ; present, the Rt. Hon. Earl Spencer, President, in the chair ; Duke of Richmond, Marquess of Downshire, Earl of Ilchester, Earl of Lisburne, Viscount Torrington, Hon. Col. Douglas Pennant, M.P. ; Hon. R. H. Clive, M.P. ; Hon. G. H. Cavendish, M.P. ; Thos. Raymond Barker, Esq. ; John R. Barker, Esq. ; John Benett, Esq., M.P. ; T. W. Bramston, Esq., M.P. ; W. R. Browne, Esq. ; F. Burke, Esq. ; Col. Challoner ; H. C. Compton, Esq., M.P. ; J. Cotes, Esq. ; J. H. H. Foley, Esq. ; B. Gibbs, Esq. ; S. Grantham, Esq. ; W. Fisher Hobbs, Esq. ; E. Holland, Esq. ; Sir John Johnstone, Bart., M.P. ; S. Jonas, Esq. ; J. Kinder, Esq. ; Sir Francis Lawley, Bart. ; Wm. Miles, Esq., M.P. ; Sir Charles Morgan, Bart. ; E. W. W. Pendarves, Esq. ; E. S. Chandos Pole, Esq. ; Prof. Sewell ; Wm. Shaw, Esq. ; R. A. Slaney, Esq. ; J. Spencer Stanhope, Esq. ; W. R. C. Stansfield, Esq., M.P. ; W. Bruce Stopford, Esq. ; and Vincent Stuckey, Esq.

The Council finally arranged the Prize Sheet for the Shrewsbury Meeting in 1845, introducing new Prizes for a Bull Calf under each of the divisions of Short-Horned, Hereford, and Devon Cattle ; additional Prizes for Horses ; a new class of Prizes for Sheep best adapted to a mountain district ; a Prize for Oats, in addition to those for Seed-Wheat and Barley ; and Prizes for Cheese made within the range of the counties of Anglesey, Carnarvon, Merioneth, Montgomery, Denbigh, Flint, Chester, Salop, and Stafford, constituting the district in which the Meeting at Shrewsbury in 1845 will be held. Those Members of Council who intended to be exhibitors at the Southampton Meeting then left the room, when the remaining Members proceeded to the appointment of Judges for the various departments of the Show on that occasion.

Fall of Rain.—The President, at the conclusion of the business of the Council, communicated to the Members present, the following interesting statement of results connected with the fall of rain during the present and the last 14 years :—

"Rain which fell on my Farm at Chapel-Brampton, Northamptonshire, during the Spring and Summer months of the under-mentioned years :—

March, April, and May.	Inches.	June, July, and August.	Inches.
1830	5.90	1830	7.79
1831	3.71	1831	7.34
1832	4.52	1832	7.91
1833	3.27	1833	6.73
1834	1.74	1834	9 34
1835	6.39	1835	3.36
1836	5.27	1836	4 32
1837	3.13	1837	6.81
1838	4.32	1838	6.52
1839	3.32	1839	8.96
1840	2 80	1840	4.88
1841	2.87	1841	11.10
1842	4.49	1842	6.45
1843	6.11	1843	5.74
1844	1.56	1844	?
Average of 14 years	4.13	Average of 14 years	6.94
Average of the spring months when less than 3 inches fell.	2.70	Average of corresponding summer months	8.44
Average of the spring months when more than 5 inches fell.	5.91	Average of corresponding summer months	5.30

The smallest quantity of rain which fell since 1830 inclusive, previous to 1844, in April and May, was 1 inch 35. This year, there has only fallen during those two months, 0 inch 28. (Signed) Spencer."

FARMERS' CLUBS.

Axminster.—The Rev. W. D. Conybeare lately delivered a lecture here on Manures. It is to be observed, that throughout all nature there is a great and continuous circulation of matter—nothing perishes—nothing is destroyed. Besides the great materials of which the globe is composed, vegetables are found to grow and reproduce their species like organised beings; they afford sustenance to the animal creation ; and, indeed, no animal could be provided with nutriment from what had not passed, in some shape or other, through the beautiful laboratory of the vegetable world. Oxygen, hydrogen, and carbon—each subservient to the higher uses of animals—entered into new combinations in nature—numberless in their variety, but all serving the purposes of man or beast. Vegetables were found to be composed of these elementary constituents, as had been proved by analysis. The gluten of vegetable bodies was found to be similar to the gelatin of the blood of animals ; for the solid particles of the blood had been shown to possess properties precisely like gluten. The combinations of carbon, oxygen, hydrogen, and nitrogen in the vegetable world were almost infinite, presenting every variety of product—oil, wine, resin, gum, wax, starch, &c., of every complexion, taste, and hue. It was also in the vegetable kingdom that Nature produced chemically four-fifths of the medicines named in the Pharmacopœia; and the lecturer had no doubt that cattle were directed by an instinct implanted by their Creator to the use of various herbs which their constitution might require. Plants separate noxious matter from the air by decomposing it; they obtain carbon from the air, and give out oxygen in return ; the carbon exists in the atmosphere in the shape of carbonic acid gas, which, it is calculated, forms one thousandth part of the entire volume of air. Animals, on the other hand, throw off carbon from their lungs, and plants take it in by their leaves ; and thus the composition, or the relative proportions of the elements forming that medium in which they both exist, is maintained constantly unchanged. Thus has an equilibrium been preserved since the beginning of creation ; the elemental constituents of the atmosphere have been running a round from air to vegetables, vegetables to animals, and animals to vegetables again, yet they exist in the same proportion as ever. We are computed to breathe a pound of carbon per day into the air, and this is taken up by vegetables, which give us back oxygen instead. Eight thousand years would, it is supposed, be occupied in turning the oxygen of the atmosphere into carbonic acid, and were all the oxygen thus changed we could not breathe ; but plants come in to our help, and by taking up the carbonic acid generated by man and by animals, restore the atmosphere to a healthful state. The fact that plants obtain carbon from the air may be proved by allowing a plant to grow in a vessel under water, connected with another vessel containing carbonic acid gas; the carbonic acid gas will be absorbed and the water take its place. But, to look above gallipots and experiments to the great forests of Nature—it may be asked how are they supplied? They can obtain carbon only from the air ; very true, but they take long periods of time in which to grow, whereas crops of corn must be raised in one season ; and we, therefore, have to surround them with an atmosphere which will supply carbon quicker. This is done by manure. Nitrogen forms another element of vegetable growth, and is procured from the air also, in the shape of ammonia, a volatile and pungent compound of hydrogen and nitrogen : plants also obtain ammonia from rain, which holds one thousandth part of it. Ammonia is given off in the decomposition of animal matter. The ashes of vegetables consist of lime, silica, alkali, and chlorine, obtained from inorganic nature in an altered condition. Many of these inorganic constituents vary according to the soil in which the plants grow ; but without a certain number of them they never arrive at maturity. It is calculated that from an acre of land, in a course of four years' cropping, there is taken away 1200 lbs. of these substances ; they must needs be restored, and this is done by manure, or allowing ground to remain fallow, whereby new particles are brought out, or into contact with each other. Fresh surfaces are exposed, and new salts are formed by fallowing. The learned gentleman then recapitulated some observations in reference to the consumption of food by animals. A part was taken up by the blood—carbon was thrown off by breathing and perspiration ; the earthy particles go to the formation of bones, and the remainder is given back in liquid or solid excrement. The fertilising power of animal manures, whether fluid or solid, is dependent, like that of the soil itself, upon the happy admixture of a great number of those substances which are required by plants in cultivation, and upon the large proportion of nitrogen which they contain. The grand principle of manuring consisted in applying or restoring to the soil what had been abstracted from it ; this was done every day by the farmer in folding his sheep ; and when he heard from his friend Dr. Buckland, a few days since, the doctor speaking of everything being given back to the soil, said—"Why do you not advise my Axminster friends to do as the Chinese do—take care of their beards when they shave?" The reverend lecturer then proceeded to recommend liquid manure, as being extremely rich in ammonia and the salts of potash ; he said the ammonia might be fixed by means of gypsum found at Branscombe ; the gypsum should be placed in tanks with the drainage of stables and cattle-stalls, and it would form sulphate of ammonia, which is far less volatile than the carbonate or smelling-salts. This sulphate of ammonia was readily obtained from urine strewed with the plaster of Paris or gypsum. This forms the urate sold as manure. Every town and farm might thus supply itself with the manure, which, besides containing the most nitrogen, contains also the most phosphates—both fertilisers to a great extent. On the Continent the powerful agency of urine as a manure was well known, and in many places it was preserved. Some philosophers were wont to regret the large waste of valuable manure by means of sewers and drains ; but such was not actually the case—nothing was really wasted—the bank of Nature was as full as ever, and contained the same stock of ammonia and earthy salts, although they might be diffused. Still it was a very different thing to the farmer whether the gold were in the Bank of England or in his own pocket—there might be plenty in the former while he remained poor ; so fertilising matters might be floating about, but his object was to have them ready at his own door. The salts contained in the deposits of birds were very efficacious ; hence the great value of guano, respecting the results of which the accounts were highly satisfactory ; Turnips, Wheat, and indeed every crop, had been raised in increased quantity by its use. It should not, however, be used with lime, as he had been informed by Messrs. Toms, of Chard, because there was an antagonism between the two substances—the carbonic acid in the lime flew off and united with the ammonia of the guano, and carbonate of ammonia resulted, which was apt to fly off like smelling-salts. The salts of potash were necessary constituents of the soil, and their application had been attended with good results in some cases. Nitrate of soda, saltpetre, and common salt were each valuable as manures, provided the soil were deficient of these substances ; and the uncertainty of result in their application might be attributed to the variaties of soil. Guano and other excrements brought each thing which the soil required, whereas the salts only supplied a particular deficiency. Lime acted mechanically upon the soil, rendering it friable and pervious to rain, and was therefore valuable ; now, clay was found in most soils, but not pure—it was mixed with silica—an important constituent of Wheat ; lime liberated the silica, or earth of flint, and enabled it to be taken up by the Wheat-plant.—*Sherborne Journal.*

Reviews.

The Dictionary of the Farm. By the Rev. W. L. Rham, Vicar of Winkfield, Berkshire. London : Charles Knight and Co., Ludgate-street.

This work is the production of one who, by familiar acquaintance with the science on which the farmer's practice depends, as well as by extensive practical knowledge of his subject, was eminently qualified as an agricultural writer. Its Preface commences thus :—"The lamented death of Mr. Rham, within less than a month after he had completed the materials of this volume for the press, cannot be passed over without a brief notice of his estimable and valuable life." Then follows an interesting biographical sketch ; and to convince our readers of our justice in recommending this work to their attention, at the same time assuring them that the articles it contains are such as might be expected from the qualifications of their author, we quote further as follows :—

"His early connection with the Continent, which was kept up in after life, afforded scope for observation of the husbandry of different countries ; and his thorough knowledge of several living languages gave him access to the works of scientific writers on foreign Agriculture. In the next place, his chemical studies at Edinburgh, while preparing for the medical profession, were of eminent service to him ; and scarcely less so was the proficiency in mathematics which he attained at Cambridge. It may safely be asserted that no other writer on Agriculture ever enjoyed in so great a degree such a combination of advantages ; and to his knowledge of the chemical and mechanical departments of Agriculture there was united a thorough acquaintance with its routine details. We would simply refer to the article 'Plough,' as an example of this combination of science with practical knowledge. On his farm at Winkfield he engaged in his

favourite pursuit, with a practical perception of its details, and a scientific knowledge of its processes, which has probably never before been possessed by one person. Thus, above all other writers of the present day on the subject of Agriculture, Mr. Rham was eminently fitted, by his excellent judgment and sound sense, to be useful to the country in the existing state of its husbandry and rural economy, when, probably, we are on the eve of great improvements in every department of these most important branches of industry. He was an active member of the council and upon the committees of the Royal Society of Agriculture, from its formation in 1838: his loss at this moment is therefore great. The present volume contains his views on all the principal subjects of interest to the agriculturist."

In addition to the article on the "Plough" here specified, we may refer to those on "Arable Land," "Soils," and many others, as likely to prove *useful* to agricultural readers. There is also much instructive matter regarding the present condition of British Agriculture to be found in a series of articles descriptive of farming as practised in the several counties.

Miscellaneous.

Disease of Wheat.—On the Rust, Red-rag, Red-robin, Red-gum.—I believe that under the names here quoted, agriculturists comprehended the attacks of what botanists consider to be two distinct species of fungi; and which the experienced eye of the microscopic observer was alone likely to separate. They form yellow and brown oval spots and blotches upon the stem, leaf, and chaff, and when the spores have burst through the epidermis they are readily dispersed. Like those of the bunt-fungus and smut-fungus, they consist of very minute grains, but their colour is different, varying from orange-yellow to brown, and their shape is not so perfectly spherical, especially those of U. linearis, which are usually oblong. Both these fungi are very common on Corn and Grasses. I have within the last two months (of July and August), seen more of the Red-rag (*U. rubigo*) as it is here called, than of any other of these Corn-pests. It abounded in the form of an orange powder which exuded from the inner surfaces of the chaff-scales, but was scarcely if ever to be seen in the skin of the seed; it might also be traced in patches beneath the epidermis of the straw, but I did not observe that it had burst through the epidermis anywhere, excepting on the inside of the chaff. It seemed to prevail more among the rough-chaffed Wheats than others; and in this parish, more especially in some fields of the variety called white Tunstall. At one time it appeared likely that these fields would be seriously injured by it, but some warm sunny weather coming on, the Red-rag lost ground, and I observed that the sori, or spots from whence the spores exuded, turned deep-brown. This disease is not so injurious as the true mildew; but although I shall speak of the latter as if it were produced by a distinct species of fungus, and in compliance with the present opinions of most systematic botanists, still I am very much inclined to think that both diseases are occasioned by the same fungus, under different forms or states of fructification. *On the Mildew.*—If agriculturists appear to have confounded under the name of rust, the attacks of fungi which botanists consider to belong to two distinct species, so also have they frequently applied the name of rust as well as mildew to the disease we are about to notice. I am inclined to consider these two diseases to be mere modifications in the attack of the same species of fungus, but further observations are required to settle this question. For the present, then, we must consider the mildew-fungus not merely as a distinct species, but also as belonging to a different genus from the two rust-fungi. The form of its spores is indeed very different from those we have already noticed. Mr. Bauer long ago published figures in which all the forms of the mildew-fungus are accurately delineated. This plate accompanies a short account of mildew by the late Sir Joseph Banks, which was published as a separate pamphlet, but afterwards reprinted in the second volume of the "Annals of Botany;" again, in "Curtis's Account of Grasses;" and again, but without Mr. Bauer's figures, in the sixth volume of "The Pamphleteer." The ripe spores of this fungus are little intensely dark-brown club-shaped bodies, having the thicker end divided into two chambers, each filled with sporules. They taper gradually at the base into a fine stalk. The sori (or patches of spores) are composed of multitudes of these bodies, which sometimes burst through the epidermis of the stem and leaves, in such profusion that the whole plant appears as if it had been scorched. I have observed this fungus intermixed with the rust-fungi in a way which strengthens my opinion that they are identical; but I do not wish to discuss this point any further, as my observations on mildew have hitherto been very slight. The only example which this year came under my notice, occurred in two fields at Audleyend, in one of which Lord Braybrooke informs me, "that Wheat was never grown before, the ground having been sheep-walk and absolutely worthless, until it was ploughed up some years ago, and since been farmed on the four-course system. The ground being much exposed, and with a northern aspect, the ploughmen call it Freeze-land. The seed was supposed to be pure Talavera." The seed in the other field was Hickland's Prolific. As these fields were mildewed in a season remarkably free from this blight, these circumstances are worth recording—and in addition I may observe, that the soil was poor chalk-land, and the field of Talavera surrounded on all sides by high hedges and plantations. The mildew in the other field was confined to one corner. *On the precautions to be taken against Rust and Mildew.*—I have very little that is satisfactory to report on this head. I do not think it has been clearly determined by experiment, whether the sporules of the rust and mildew fungi are absorbed by the roots of Corn, like those of the bunt and smut fungi; or whether, (which seems to be the more prevalent idea) they enter through those minute pores on the stem and leaves which botanists term *stomata*. The fungi at first make their appearance in little cavities seated immediately beneath these pores, which certainly looks very much as if the sporules entered there. The stomata are naturally exhaling organs, continually discharging, under the influence of light, a large proportion of the water imbibed by the root. But in moist weather this function is impeded, if, in some cases, it be not actually reversed; when it would be easy for the sporules to enter these invisible stomata, with the moisture imbibed by them. The fact, however, stands in need of proof; and hitherto the evidence is more in favour of similar fungi being imbibed by the roots of the plants which they attack. Mr. Knight, indeed, who is high authority, particularly insists upon mildew being induced by foggy weather happening at a time when the ground is particularly dry: circumstances which we may readily understand as likely to convert the stomata (or even the whole superficial tissue of plants) into imbibing organs. If the autumnal fogs really pre-dispose Wheat to the attacks of the mildew-fungus, we must agree with those who recommend the growth of early varieties in places subject to these fogs. It seems to be pretty generally admitted that spring Wheats are less liable to mildew than winter Wheats; and that heavy soils are less subject to it than light ones. But, at present, the information on these points is very vague and unsatisfactory. We may safely conclude, that a generally healthy state of the plant, without any over-luxuriance of vegetation, is most likely to secure a crop against the attacks of the rust and mildew-fungi; but, that whatever tends to render the plant sickly, whether it be excess of heat or cold, drought or wet, sudden changes of temperature, poverty of soil, over-manuring, shade, &c. &c., must be considered as a pre-disposing cause to these diseases. Supposing it were clearly ascertained that a Corn crop had imbibed the sporules of the mildew-fungus early in the season, might it not be advisable to feed it down by sheep? I ask the question in perfect ignorance of the propriety or practicability of such a course. The rust and mildew-fungi attack many Grasses, and I have this year found the latter in great perfection in the common Reed. It is evident, therefore, that we can never expect to exterminate these fungi; but that their sporules will always be found in our fields, ready to attack the Corn crops whenever these are brought into a state adapted to receive their influence. Whether remedial or palliative measures may not be discovered is an inquiry well worthy the attention of agriculturists.—*Professor Henslow's Report, 2nd vol. of the English Agricultural Society's Journal.*

Notices to Correspondents.

AGRICULTURAL GAZETTE.—*T. Green.*—We do not know any one anxious to take the paper as you propose. With regard to the contents of your drain, you had better mix them with fresh burnt charcoal dust, which will destroy the smell and dry the material, so as to cause its application to the land an easy and not disagreeable operation.

BURNT CLAY.—*A Subscriber* will find information on this subject in this and the next Numbers of Sprengel's Inorganic Manures. Spread 30 cart-loads an acre on your land, and mix it with the soil by ploughings, &c.

CLOVER DODDER.—*W.*—Your specimen is the Flax Dodder.

HIGHWAYS.—*A Constant Reader.*—Gates erected in highways time out of mind are not a nuisance, and cannot be removed. But if a new gate be so placed, it is an obstruction, and a nuisance which any one may abate. We are not aware that such cases are within the summary jurisdiction of magistrates, unless under such circumstances as may bring them within the 72d section of the General Highway Act, "for wilfully obstructing the free passage of any highway." *W.*

HUMBER WARP.—*B.R.W.*—You had better get the mud out now, and mix such a quantity of lime with it as, considering the quantity you intend to apply, will amount to 80 or 100 bushels per acre. The influence of the lime on the salt will be beneficial. If it be applied as fine as possible in autumn, the winter weather will enable you to spread it perfectly in spring.

LAND SOCIETY.—*H.F.*—Is there no more effective way of investing your funds in the employment of agricultural labourers, (that is your object, is it not?) than by the *purchase* of land to be cultivated by the spade? Will you favour us with the history of your Society? With your *apparently* limited funds, you cannot, surely, have done much.

***As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, June 24.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	8 to 4s	0	Best Downs & Half-breds	3s	10 to 4s	0
Best Short Horns	3	4	3	8	Best Long-wools	3	6	3	10
Second quality Beasts	2	10	3	2	Ewes and second quality	3	2	3	6
Calves	3	8	4	2	Lambs	4	0	5	0
Pigs	3	4	4	0					

Beasts, 2285; Sheep and Lambs, 31,610; Calves, 217; Pigs, 387.

We have a smaller supply of Beasts to-day, especially of the best qualities, consequently there is an advance of fully 2d per 8 lbs on Scots, Herefords, &c. There is not such a rise in the price of the larger Beasts; we cannot quote Short horns at more than 3s 8d, although in some few instances a little more than that is obtained. The number of Sheep and Lambs is also less than last week, but there are quite sufficient for the demand; the trade is, however, rather brisker, and our top quotations are readily realised for the best qualities. Veal and Pork are about the same as on Monday last, but not quite so good as on Friday.

FRIDAY, June 28.

Our supply of Beasts to-day is good; there are also plenty of buyers, at a little advance on Monday's prices. We have very few good Scots on offer; many of second quality Scots and best Short-horns are making very nearly 4s per 8 lbs. In Sheep and Lambs we have a larger number than has been known on the Friday for some years; notwithstanding, our Monday's prices are pretty well supported, owing to a deficient supply at the dead market during the week. Calves sell slowly, the numbers being large; the best make very little over 4s per 8 lbs. Pork is a heavy trade, owing to the warm weather.

Beasts, 785; Sheep and Lambs, 13,620; Calves, 535; Pigs, 361.

41, West Smithfield.

WOOL.—BRITISH, FRIDAY, June 28.

OUR advices from the manufacturing districts report favourably of the state of the Wool trade. There is a good and steady demand for the article, and stocks have somewhat decreased, but prices continue stationary. The Staplers still complain that the prices demanded by the growers are much higher than, in the present state of the market, they can afford; consequently their transactions with the Farmers have as yet been few.

JAMES PEARSE, Wool Broker.

MARK-LANE, MONDAY, June 24.

WE had a short supply of English Wheat this morning from the near counties; the Essex and Suffolk was disposed of on about the same terms as this day week, but some quantity of Kent was left unsold, although offered at rather lower rates. In Free Foreign there was a fair retail sale at late prices.—We observe no alteration in the value of English Barley, but Foreign f. o. b. continues to find buyers at fully former prices.—Beans are the turn lower.—Peas fully support our quotations.—The arrival of Oats being large, they meet a slow sale, and the advance of last Monday is not maintained.

FRIDAY, June 28.

The arrivals of English Wheat since Monday have been moderate, and the little offering is with difficulty disposed of on that day's terms. The demand for Foreign is languid, and quite in retail; but holders are firm, and not inclined to force sales. There is but a trifling business doing in Spring Corn of any description, and late prices are barely maintained.—Oats must be noted 6*d*. to 1*s*. per qr. lower.

KINGSFORD AND LAY.

HOPS, FRIDAY, June 28.

THERE is no alteration in our market since this day week; the accounts from Sussex, Weald of Kent, and Worcester are daily worse, and the late rain has increased the vermin very much in those districts, and an appearance of fresh fly since the rain. PATTENDEN & SMITH, *Hop-Factors.*

COVENT GARDEN, JUNE 29.—The market has been well supplied with both Fruit and Vegetables during the week; but trade for some things has been dull. Pine Apples are more plentiful and are remarkably fine; they consist chiefly of Queens, Providence, and Jamaicas. The supply of Peaches and Nectarines has been unusually abundant; but the demand for them is not great. Strawberries and Cherries are daily becoming more plentiful in the market, and Raspberries are now added in pretty considerable quantities. Hothouse Grapes of excellent quality are sufficient for the demand, and are slightly reduced in price. The supply of Dutch and English Melons is well kept up; good specimens of the latter are offered at about 6s. each. Oranges and Lemons are much the same as last week. Considerable quantities of perfectly ripe Gooseberries and Currants are in the market. Vegetables, in consequence of the late more favourable weather, begin to improve. Cauliflowers are good and plentiful. Asparagus is becoming scarce, as is also Rhubarb. French Beans are slightly altered in price. Peas have been much dearer during the week, and have been in consequence less on demand; they are, however, again fallen in price, and a brisk trade for them is expected. Lettuces and all kinds of Salading are plentiful. A few specimens of Vegetable Marrow have been brought to the market during the week. Cut Flowers chiefly consist of Combretum purpureum, Cactus speciosissimus, Sweet Peas, Lily of the Valley, Alstroemeria pelegrina, Heaths, Pelargoniums, Gardenias, Pinks, Fuchsias, Verbenas, Moss, Provins, and other Roses.

FRUITS.

Pine Apple, per lb., 4s to 8s
Grapes, Spanish, per lb, 1s to 1s 6d
Hothouse Grapes, per lb., 3s to 6s
Melons, each, 3s to 6s

POTATOES.—SOUTHWARK WATERSIDE, June 24.

THE weather the early part of the week was more genial, and some slight showers fell in the immediate vicinity of London, but there was some fine rains fell at some distance from the Metropolis, which will prove beneficial to the crops generally, and to the green crops in particular, but at the close the heat was excessive; these, together, have had a tendency to depress our Market, and the best samples went off slowly, with some deduction on our last quotations, and the inferior have been a complete drug, especially the Perth Reds, in consequence of the damage occasioned by the dry rot. There are several parts of cargoes left for the coming week, much against the inclination of the holders. There were a few arrivals from Devonshire and Holland, and the supply appears more than sufficient, as the demand becomes very limited. This market will shortly close for the season.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s* 6*d* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

HORIZONTAL WATCHES, very flat.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine Edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

In one small volume, price 15*s.*,

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

Now ready, price 4*s.* 6*d.*,

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., F.R.S.,

Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution.

&c. &c. &c.

Extracts from the Introduction:—

"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

THE NEW QUARTERLY REVIEW;

AND

HOME, FOREIGN, AND COLONIAL JOURNAL.

BEING THE SEVENTH NUMBER OF THE FOREIGN AND COLONIAL QUARTERLY REVIEW.

In announcing the Seventh Number of the "FOREIGN AND COLONIAL QUARTERLY REVIEW," the Proprietors have to apprise their readers of the reasons that have induced them to adopt a partial change in the Title. Their original scheme, as the Prospectus stated, contemplated the intermingling of British and Foreign subjects. But from the similarity of the Title with existing Foreign Reviews, considerable practical inconvenience has been experienced by their Subscribers. They have therefore decided upon a more General Title, "THE NEW QUARTERLY REVIEW," by which, while maintaining their own distinctiveness, they disclaim any intention of rivalry with existing Reviews beyond that of upholding the noblest principles, and producing the best arguments in their support. Were they called upon to add further reasons for this measure, they might state, that in all directions they have been urged to assume in name, as well as fact, their true position. Their career in Foreign Literature is already before the Public; and they purpose not only the continuation, but even the augmentation of the Foreign Correspondence and Intelligence; and in British subjects, they are justified in stating, that the aid they have hitherto received from some of our leading Statesmen will still be continued.

CONTENTS OF NO. VII.

1. The Political Press of France
2. Fine Arts at Munich
3. The Books of Proscribed—Niemcewicz, Custine, and Dolgorouky
4. The New Spirit of the Age
5. The Gospel before the Age
6. History of Russia (Karamsin)
7. Colonial Bishoprics
8. Despotism and Democracy
9. The New Generation
10. The Life of the Founder of La Trappe—Chateaubriand
11. Short Criticisms—Archives of the Israelites; M'Gregor's Statistics; Mexico; Slavonia; Ceylon; Ethiopia; Australia
German, French, and English Publications; Foreign Correspondence and Intelligence
Miscellaneous, &c.

London: SMITH, ELDER, and Co., 65, Cornhill; Edinburgh: BELL and BRADFUTE; Dublin: J. CUMMING.

THE WORKS OF G. P. R. JAMES, TO BE PUBLISHED QUARTERLY.

On the 1st of July, in medium 8vo, neatly bound, price 8s. A NEW AND ILLUSTRATED EDITION OF

THE WORKS OF G. P. R. JAMES, ESQ.

This interesting Series will commence with "THE GIPSY," and will be followed, on the 1st of October, by "MARY OF BURGUNDY." Each Volume will comprise a complete Work, beautifully printed in a large type, and will appear at intervals of three months, the whole carefully revised by the Author, and beautifully illustrated.

Detailed Prospectus and Specimens may be had on application to the Publishers, SMITH, ELDER, & Co., 65, Cornhill, London.

8vo, sewed, price 2s. 6d.; by post 3s.,

A DESCRIPTION of the BAR-AND-FRAME HIVE, invented by W. AUGUSTUS MUNN, Esq., with an Abstract of WILDMAN'S Complete Guide for the Management of Bees throughout the Year.

JOHN VAN VOORST, 1, Paternoster-row.

On the 29th instant will be published,

CHAMBERS' EDINBURGH JOURNAL; the First Volume of the New Series, price 4s. 6d. Handsomely bound in Embossed Cloth, specially designed for the work. The Volume will contain about 250 distinct Articles of an entertaining and instructive kind, and will form a handsome and portable Library Volume every half year.

London: Wm. S. ORR & Co., Amen Corner, Paternoster-row.

WORKS ON NATURAL SCIENCE

PUBLISHED BY

WM. S. ORR & Co., Amen Corner, Paternoster-row.

PAXTON'S MAGAZINE OF BOTANY, in Ten vols. royal 8vo, price 13l. 10s., half-bound morocco, and containing upwards of 450 Illustrations of the most beautiful Flowering Plants introduced during the last ten years, beautifully coloured, after the finest specimens; with their Botanical Descriptions, Natural History, and Directions for their Cultivation.

CUVIER'S ANIMAL KINGDOM; medium 8vo, price 18s.; or with Landseer's Etchings, price 25s. cloth, lettered. Translated from the best French Edition, and brought down to the present state of science.

The MAMMALIA, BIRDS, and REPTILES, by Mr. E. BLYTH.
The FISHES, by the late Mr. MUDIE.
The MOLLUSCA, by GEORGE JOHNSON, M.D.
The CRUSTACEA and INSECTS, by J. O. WESTWOOD, F.L.S.

THE BRITISH CYCLOPÆDIA of NATURAL HISTORY; in 3 vols. sup.-royal 8vo, price 2l. 5s. cloth, or 2l. 11s. half-bound morocco. The articles were contributed by Messrs. MUDIE, WESTWOOD, BLYTH, MAIN, and many other writers of reputation; and the Work presents, under its Alphabetical arrangement, Treatises on every branch of Natural History.

WHITE'S NATURAL HISTORY and ANTIQUITIES of SELBORNE. Price 5s. 6d. cloth lettered. With Notes by Mr. EDWARD BLYTH, a Map of the Locality, beautifully engraved on Steel, and an interesting account of the present state of Selborne, written during a visit to Selborne in 1836, by Mr. MUDIE.

London: Wm. S. ORR & Co., Amen Corner, Paternoster-row.

CYCLOPÆDIA OF NATURAL SCIENCE. By W. B. CARPENTER, M.D., F.R.S., Lecturer on Natural History and Comparative Anatomy at St. Thomas's Hospital.

VEGETABLE PHYSIOLOGY and BOTANY. Price 10s. cloth lettered; or each Part separate, price 4s 6d. sewed. Elementary Treatises, adapted equally for the instruction of those who have no previous knowledge of the subject, or as a text-book for the more advanced students. A New Edition, carefully revised and much enlarged by the Author.

MECHANICAL PHILOSOPHY, HOROLOGY, and ASTRONOMY. Price 9s. 6d. cloth lettered, or 4s. 6d. in Parts, exhibiting in the FIRST Part the highest principles of science in their connexion with each other and with the phenomena they govern, and in the SECOND, their application to astronomical purposes, and to the admeasurement of time.

ANIMAL PHYSIOLOGY. Price 10s. 6d., cloth lettered, or in Parts 5s. each, sewed. Combining with the general principles of Physiology and Comparative Anatomy details suited to the general reader, and calculated to teach him not only *what is*, but *why it is so*.

ZOOLOGY and INSTINCT of ANIMALS. To be completed in 2 Vols. Price 10s. 6d. each. cloth lettered, or in Four Parts 5s. each, sewed, exhibiting the general principles of classification, with such details of habit or locality as will interest the general reader; with reflections on the most interesting instances of instinct in animals.

London: Wm. S. ORR & Co., Amen Corner, Paternoster-row.

12mo, price 9s. cloth,

A MANUAL OF BRITISH BOTANY; containing the Flowering Plants and Ferns, arranged according to the Natural Orders. By CHARLES C. BABINGTON, M.A., F.L.S., F.G.S.

"Mr. Babington's is a very valuable contribution to our knowledge of British plants, full of original observation and good critical remarks. It has also an excellent feature in marking in Italics those points in the specific characters to which attention is particularly demanded."—*Gardeners' Chronicle.*

JOHN VAN VOORST, 1, Paternoster-row.

Second Edition, price 1s. 6d.,

CHEMISTRY MADE EASY, for the Use of Agriculturists. By J. TOPHAM, M.A.

"Cheap, short, and intelligible."—*Era*, March 24, 1844.

WHITAKER, Ave Maria-lane; may be had of all Booksellers.

Just published, the Thirteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 33s. PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

Just Published, the Second Edition, with 44 Wood-cuts, and a coloured Geological Map of the British Islands, Price 4s. 6d.,

A MANUAL OF GEOLOGY; with a Glossary and Index. By PROFESSOR MACGILLIVRAY, M.A., &c., Marischal College, Aberdeen.

This Treatise is intended to convey, in a systematic manner, and in a condensed form, as much knowledge of the more important facts and phenomena, and of the theories elicited from them, as will suffice for general instruction; and to render it suitable for a class-book, a series of recapitulary questions have been appended to each chapter.

"A better and more useful manual we never met with."—*The Age.*

ADAM SCOTT, Charterhouse Square; and obtained, on order, of all Booksellers.

MACGILLIVRAY'S BRITISH BOTANY.

Fifth Edition, with 155 figures, 12mo., price 10s. 6d.

WITHERING'S BRITISH PLANTS: corrected and condensed; preceded by Instructions adapted for Persons commencing the study of Botany. By PROFESSOR MACGILLIVRAY, Marischal College, Aberdeen.

This work contains familiar descriptions of all the indigenous flowering plants of Great Britain, Ireland, and the Channel Islands, so full as to enable the young botanist to determine every species he may meet with, without the assistance of others.

London: ADAM SCOTT, Charterhouse-square.

THE ONLY ENGLISH EDITION AUTHORISED BY M. EUGENE SUE.

Part I., comprising the first five Weekly Numbers, price 2s. 6d., a new and splendid Edition of the

MYSTERIES of PARIS, adapted to the English Reader. Illustrated with upwards of 700 Engravings on Wood of all the Characters, Scenes, Costumes, and Localities described in this extraordinary work, executed expressly for this Edition by the first Artists in Paris. SATURDAY, JUNE 29, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50, REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued. GEORGE BEAUMONT, Actuary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, (Instituted in 1805), New Bridge-street, Blackfriars.

BONUS every THREE Years. Eighty per cent. or Four-fifths of the Profits returned on Policies effected after the 1st of May, 1844.

The new Prospectus, containing a full detail of the highly advantageous Terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

EDWIN CHARLTON, Secretary.

CROWN LIFE ASSURANCE COMPANY,
33, Bridge-street, Blackfriars, London.

DIRECTORS.

George H. Hooper, Esq., Chairman
Sir John Kirkland, Deputy Chairman

John Chapman, Esq. | Jameson Hunter, Esq.
Charles Chippindale, Esq. | Lieut.-Col. Moody, R.E.
James Colquhoun, Esq. | John Nelson, Esq.
B. D. Colvin, Esq. | Richard Norman, Esq.
Rear-Admiral Dundas, C.B., M.P. | Alexander Stewart, Esq.
Thomas Harrison, Esq. | William Whitmore, Esq.
William Wilson, Esq.

Auditors.—J. H. Forbes, Esq.; Geo. Hankey, Esq.; Thomas Lawrence, Esq.
Physicians.—Dr. James Johnson, 8, Suffolk-pl., Pall Mall East; Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street
Surgeon.—Samuel Solly, Esq., F.R.S., 1, St. Helen's-place
Standing Counsel.—Charles Ellis, Esq.
Solicitors —Messrs. Hale, Boys, and Austen
Bankers.—Bank of England
Actuary.—J. M. Rainbow, Esq.

THE ADVANTAGES OF THIS OFFICE, among others, are:

1. A participation septennially in two-thirds of the profits, which may be applied either in reduction of the premium, or to augment the sum assured.

The following BONUSES have been assigned to all Policies, of at least three years' standing, effected for the whole duration of Life:—

FIRST DIVISION, IN 1832.

From 18*s.* to 2*l.* 12*s.* per cent. per annum on the sums assured, varying with the age, being equivalent, on the average, to 26½ per cent. on the premiums paid.

SECOND DIVISION, IN 1839.

From upwards of 1*l.* to upwards of 3*l.* per cent. per annum on the sums assured, or, on the average, 33 per cent. on the premiums paid for the preceding seven years.

2. Premiums may be paid in a limited number of annual sums, instead of by annual payments for the whole of life; the Policy continuing to participate in profits after the payment of such premiums has ceased.
3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.
4. Permission to pass to Continental Ports between Brest and the Elbe inclusive.
5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service), may be assured to reside in or proceed to all parts of the world, at premiums calculated on real data.
6. Claims to be paid within three months.
7. The Assured may dispose of their Policies to the Company.
8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c. to be had at the Office in London, or of the Company's Agents.

T. G. CONYERS, Secretary.

News of the Week.

THE practice of opening letters at the Post-office, which was brought before the House of Commons a fortnight since, has been again under discussion in both Houses of Parliament. In the former instance the practice was made public by a petition from Signor Mazzini, an Italian gentleman of high literary character, and an exile from the Lombardo-Venetian kingdom. Signor Mazzini asserts, that from 60 to 70 letters addressed to him have been opened since the beginning of March last: that while residing in London in perfect security and good faith, the *Augsburg Gazette*, four months ago, announced, by apparent authority, that he was living under the surveillance of the London police, and he has since found that during all this time his letters were opened at the Post-office. The second case was that of a Polish exile, who states in his petition that his letters have also been opened, and denies, like Signor Mazzini, that the correspondence contained anything to warrant such espionage. In both instances it is asserted that in opening the letters, every care had been taken to avoid suspicion; that impressions had been taken from the seals, that with these impressions the opened letters had been resealed, and that the cut was made so clean, that a microscope was necessary to discover it. In addition to these cases a rumour was mentioned by Captain Bernal in the course of the debate, and not contradicted, that the Irish correspondence was habitually violated; and a general impression is abroad, that the practice has been in operation for a considerable period, and has been extensively used by Sir James Graham since his appointment to the Home Office. In the course of the debate Ministers defended themselves by relying on an Act of Parliament which gives authority to the Secretary of State to issue warrants for opening letters; but they declined to give any explanation of the circumstances which led to the exercise of this power on the recent occasions. On the other hand, the practice was denounced by men of all parties as un-English and odious; and among others, by the Lord Chief Justice, who declared that it is not a question of expediency or inexpediency, but a question of right or wrong, and that a power so exercised as to involve not merely concealment, but something very like forgery, is so odious, that it cannot longer be endured without modification. Mr. Duncombe's motion for referring the petition to a select committee was negatived on Monday by a majority of 44; but notice has since been given that he will bring it forward again on Tuesday night. In the Lords also the subject has merely been postponed, Lord Radnor having given notice that he will bring the matter again before the House in some decided shape on Thursday next. — On Wednesday, Mr. Villiers's motion on the Corn Laws, after two nights' debate, was negatived by a majority of 204; and on Thursday the Sugar Duties Bill was read a third time and passed. The Bank Charter Bill has passed through committee, after divisions on some of its clauses which were decided in favour of Ministers.—The Irish State Trials will next week be again a leading topic of interest, the Lord Chancellor having directed the judges to be summoned to attend in the House of Lords on Thursday next, in order to hear the arguments in the pending writs of error.

From France we have accounts of another skirmish with the troops of Morocco, and of the departure of the Prince de Joinville, with a powerful squadron, for the coast of that country. The Paris journals demand the adoption of decisive measures to bring the affair to a crisis, while the Ministry announce their anxiety to avoid a war, and to submit their differences with the Emperor to the mediation of this country.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princesses, continue at Buckingham Palace, and are quite well. The Queen, during the week, has taken her usual morning walk in the Palace gardens; and on Monday and Wednesday Her Majesty took an airing in an open carriage. On Saturday evening the Queen and Prince Albert, attended by their suite, honoured the Duke and Duchess of Sutherland with their company at Stafford House, to be present at the christening of the infant son of the Duke and Duchess. The christening was solemnised shortly after the arrival of Her Majesty, the ceremony being performed in the picture gallery by the Archbishop of York, assisted by the Rev. Sir Henry Dukinfield, Vicar of St. Martin's-in-the-fields. The sponsors were his Royal Highness Prince Albert, Viscount Morpeth, and Lady Francis Egerton, who was in her absence represented by Lady Blantyre. The infant was named Albert after his godfather. A selection of sacred music was performed from the organ in the area of the staircase until dinner was announced. At the table her Majesty and Prince Albert sat together, the Duke of Sutherland sitting on the left of the Queen, and the Duchess on the right of Prince Albert. The balcony above the portico was tastefully illuminated, and decorated with white lilies, and the *jets d'eau* were in full play. On the dessert being placed on the table, the Duke's piper, in the full costume of the Duke's clan, passed round the banqueting-room, playing a Scottish national air. At the termination of the dinner a concert was given at the bottom of the marble staircase, at which her Majesty and Prince Albert were present. Shortly before 11, her Majesty and his Royal Highness returned to the Palace. On Sunday the Queen and Prince attended divine service in the Chapel Royal of Buckingham Palace. On Tuesday the Prince presided at a meeting of the Fine Arts Commission, and afterwards inspected the sculptures and frescoes deposited in Westminster Hall for the examination of the commissioners, and for subsequent exhibition to the public. On Wednesday his Royal Highness transacted business at the office of the Duchy of Cornwall, and on Thursday presided at the anniversary of the Infant Orphan Asylum, at Wanstead. On his return to town the Prince inspected the new Royal Exchange, and the statue of the Duke of Wellington. Her Majesty, Prince Albert, and suite, visited Westminster Hall yesterday, for the purpose of inspecting the frescoes. Her Majesty, on arriving at the Hall, was received by Sir R. Peel, Sir J. Graham, the other members of the Government, and Lord J. Russell, &c.—Letters have been received from Nuremburg, the 12th inst., by which we learn that H.R.H. the Duchess of Kent, accompanied by Prince Leiningen, and attended by Sir G. Couper and Lady A. M. Dawson, were on that day to leave that city, where the royal party arrived the previous afternoon for Gotha, to visit the Duke and Duchess of Saxe Coburg Gotha. The Duchess was enjoying the best health.

THE KING OF SAXONY.—His Majesty honoured the Marquess of Salisbury by a visit at Hatfield House, on Thursday, the 20th. Previous to luncheon, His Majesty was conducted over the house, one of the finest Elizabethan mansions in this country. The long gallery, in which are some admirable oak carvings, the west wing but recently completed, and the chapel were visited, and in the other parts of the house the family portraits, and other paintings, were generally admired by His Majesty, particularly an original portrait of Queen Elizabeth, considered one of the most faithful likenesses extant. The stables, and new tennis-court and riding school were visited by His Majesty, after which, accompanied by the Marquess, the King drove round the park, first going to see Queen Elizabeth's oak, at which spot tradition states that Her Majesty received the intelligence of her accession to the Crown. The beautiful grounds bounding the river, called the vineyards having been gone over, the King passed by the oak pollards, a remarkable feature in the park, as they are of great age and luxuriant growth, and particularly attracted His Majesty's notice. The King having expressed himself much pleased with these fine oaks, the Marquess requested the carriages to be driven to the Lion Oak, a tree which exceeds in girth all the other oaks on the demesne. His Majesty then returned to the mansion, when luncheon was announced. The *dejeûner* was served up in the marble hall, which possesses all the characteristics of the old baronial construction. The King and suite having partaken of luncheon then left Hatfield, it being nearly two o'clock, for Stevenage, and from thence, by Royston, to Cambridge.

PRINCE HENRY OF HOLLAND.—The squadron under the command of His Royal Highness left Plymouth Sound for the Mediterranean on Wednesday week. On Sunday the Prince dined with the Port Admiral. On Monday his Royal Highness, with some of his officers, privately walked through the Dockyard. On Tuesday he witnessed the review in honour of the anniversary of the battle of Waterloo, at its conclusion partook of a *dejeûner*, and in the evening dined at the official residence of Major General the Hon. G. Murray, Commander-in-Chief of the district. On Wednesday the annual bazaar in support of the funds of the Royal Female Orphan Asylum, intended chiefly for the relief of the orphans of naval officers, was held on the ground in front of Penlee Villa, under the immediate patronage of his Royal Highness, who proceeded thither in the carriage of the Port Admiral. The Prince, who has become the patron of the institution, which has her Majesty as patroness, purchased liberally of all the fair vendors, and by his example no doubt very much increased the receipts for the day. On leaving the bazaar his Royal Highness proceeded on board his frigate, and the squadron immediately got under weigh, and left the harbour under the usual exchanges of salutes.

The Lord Lieutenancy.—The Duke of Buccleuch, the Duke of Richmond, Lord Wharncliffe, and Lord Heytesbury, have each been mentioned during the week as likely to become the new Viceroy of Ireland; it is generally believed that the appointment will be conferred on Lord Heytesbury.

Parliamentary Movements.—The Hon. Henry Cole has been elected member for Enniskillen without opposition, in the room of the Hon. A. H. Cole, who has accepted the Chiltern Hundreds. — Sir David Roche retires from the representation of Limerick, and will be succeeded by Mr. James Kelly, of Ballynanty, late High Sheriff of the county, and an active Repealer. — The *Limerick Chronicle* says that the Repealers of Mallow have resolved upon turning Sir D. J. Norreys, M.P., out of that borough, unless he takes their pledge.—Mr. Madden, son of the late mayor of Sligo, is to succeed Mr. Somers, M.P., as representative for that borough. Captain Perceval, son of Colonel Perceval, the late member, is reported a candidate for the county of Sligo on the next vacancy.—Mr. Alexander M'Carthy, barrister, has offered himself to the Cork electors, on Repeal principles, in the event of a vacancy in the representation of that city.

The Navy.—Sir Richard Dobson, senior physician of Greenwich Hospital, has retired, after half a century's service, and has been succeeded by Dr. Liddell, of Haslar Hospital, on a salary of 600*l.* per annum. Dr. King, of the establishment at Bermuda, has been appointed to succeed Dr. Liddell at Haslar, on a salary of 500*l.* per annum.

The Summer Circuits.—The last days for full notices of trial at the several ensuing assizes are of the dates and for the places as undermentioned, being in each case about ten days before the commencement of the assizes:—Monday, June 28—Cardiff. Wednesday, June 29—Abingdon, York and city, Hertford, Buckingham, and Winchester. Wednesday, July 3—Oxford, Bedford, Newton, and Carmarthen. Friday, July 5—Northampton and Chelmsford. Saturday, July 6—Huntingdon and Dolgelly. Monday, July 8—Cambridge and Dorchester. Wednesday, July 10—Oakham. Friday, July 12—Lincoln, Worcester, Carnarvon, Haverfordwest and town. Saturday, July 13—Ipswich, Exeter and city. Monday, July 15—Durham, Beaumaris, and Cardigan. Wednesday, July 17—Nottingham and town. Friday, July 19—Stafford, Lewes, Ruthen, and Brecon. Saturday, July 20—Derby, Norwich and city, and Bodmin. Monday, July 22—Newcastle and town, Guildford and Presteign. Wednesday, July 24—Leicester and borough, and Mold. Friday,

July 26—Shrewsbury, Chester (North Wales Circuit), Chester (South Wales Circuit). Saturday, July 27—Coventry, Carlisle, Wells, Warwick and Hereford. Monday, July 29—Appleby. Wednesday, July 31—Monmouth and Lancaster. Saturday, August 3—Devizes, Gloucester and city. Monday, August 5—Liverpool. Wednesday, August 7—Bristol.

Foreign.

FRANCE.—A telegraphic despatch from the Governor-General of Algeria reached Paris on Sunday, announcing the renewal of hostilities with the troops of Morocco. The despatch is dated from Lalla Magrina, June 16, and is to the following effect:—"Yesterday, during a conference with the commander of the Morocco army, his troops, to the number of 5000 cavalry, fired upon ours, and wounded an officer and two soldiers, without our returning the fire. The conference was broken up, and Generals Lamoriciere and Bedeau were attacked by the troops of the Emperor of Morocco. I arrived, and assumed the defensive, and killed of the enemy from 300 to 400, who remained on the field. I captured some horses, and from 300 to 400 stand of arms. Never was any chastisement better merited. We had 6 killed and 20 wounded." This despatch is conspicuously noticed by all the Journals. Several of the Opposition prints comment upon it, and consider it a very important communication, accusing the French Ministry of having concealed the real state of the quarrel with Morocco, and of having again temporised, out of deference to the counsels of the English Government, to the detriment of the honour and interests of France. The *Commerce* calls upon the Cabinet to put an end to its tergiversation, when a war with Morocco has become inevitable, and prompt and decisive action can alone shelter the French possessions in Africa from the perils that threaten them. The *National* is more violent still. After deriding the professed security of Marshal Soult and M. Guizot, and indignantly telling them that they have been wanting in energy and promptitude, it calls upon the Chambers not to remain silent amidst these events, but to understand that war is upon their territory, while M. Guizot is asking the advice of Lord Cowley. The Prince de Joinville sailed from Toulon on the 23d, in the line-of-battle ship Le Suffren, in which he has hoisted his flag. His Royal Highness proceeded, not to the coast of Morocco, but to Oran. Two ships of his squadron took their departure on the preceding day, and the other ships that are to be under his command will join his Royal Highness without delay. His squadron will be composed of 3 ships of the line, the Belle Poule, 60-gun frigate, and 3 steamers.—The late debate in the House of Commons on the Sugar Duties, has excited great attention in Paris, and the papers concur in condemning the House for rescinding their votes at the dictation of the Minister. It is curious, however, that while the journals were speculating on these events, a similar occurrence took place in the Chamber of Deputies. In Saturday's sitting, in the discussion on the Paris and Lyons Railway Bill, M. Gaultier de Rumilly moved an amendment that a sum of 62,000,000f. be voted to the formation of a railroad throughout the whole distance between Paris and Lyons; and supported it by arguing that there were pecuniary advantages to be gained by railroads which belonged properly to the state, and which ought not to be given up to private companies. The Chamber divided upon the question, and after two doubtful attempts a scrutiny was called for, when the amendment was carried by 138 to 137. As this result would affect all railways in France, and be a serious blow to the Ministry, the announcement created an immense sensation in the Chamber, and the sitting was for a considerable time suspended. On Monday the Chamber resumed the adjourned discussion on the Bill, the Cabinet in the mean time having held several councils on the subject. The Minister of Finance observed, with respect to the amendment adopted on Saturday, that it would substitute quite a new system to that laid down in the law, and that the Chamber could not think of imposing on the state additional sacrifices to those already imposed by the Bill of 1842. The Ministers of Public Works and of the Interior spoke nearly to the same effect, and concluded by moving that the consideration of the question whether the Government should, or not, lay down the rails, be postponed until next session. After some further debate the President put the adjournment, when, after two trials declared doubtful by the board, a ballot was opened, which finally gave Ministers a majority of 28 votes. The vote of Saturday was thus rendered a dead letter, and on Tuesday the Chamber passed the Bill by a majority of 191 to 51, leaving out such parts as were, by the vote of the day before, postponed to next session. The Rouen and Nantes Railroad Bill was also passed by 202 to 45, the sum of 28,800,000f. being voted for the purpose. It has also been resolved that the Paris and England Railroad shall communicate with Calais, Dunkirk, and Boulogne.—On Sunday morning, at six o'clock, the police invaded the mansion of the Prince de Montmorency, during his absence. The police broke open the locks, and were eight hours in making a minute search, after which they carried away to the Prefecture de Police, in addition to papers, a large number of busts and engravings, representing the elder branch of the Bourbons. On Monday a similar search was made in the house of the Duc d'Escars, and it is said that M. de Lespinois has been arrested. The cause of these proceedings is said to be the discovery of an attempt to corrupt the troops at Issy, by distributing among them letters and medals of the Duc de Bordeaux.—The dispute between the President Séguier and the bar is by no means arranged. The Judges met on Wednesday to consult as to what was to be done with regard to the letter addressed by the Council of the Order of Advocates to the President, and after five hours' deliberation decided that the 21 members of the Council of Discipline who signed the letter should be summoned to appear before the Court on the 1st of July. The affair excites great interest among professionals and politicians in Paris.—The Paris papers state that among the objects deposited at the bank of M. Caccia, whose failure was declared at Paris last month, was a box containing Lord Byron's manuscripts. This box, belonging to the Countess Guiccioli, to whom the poet bequeathed his most precious *souvenirs*, was withdrawn last week from the office of the bankruptcy syndic and delivered to M. Micard, the Countess's agent. Besides the manuscripts of all the published works, the box contains some unpublished poetical pieces, and critical notes written by Lord Byron himself upon his own work.

SPAIN.—We have accounts from Madrid to the 19th inst. The recent conversations in the British Parliament on the subject of the communication addressed by Don Carlos to the English Government, and transmitted by Lord Aberdeen to the Spanish Ministry, is the subject of comment in several of the Madrid papers. The Ministerial papers are unanimous in disapproving of the marriage of the Prince of Asturias with Queen Isabella. The Minister of Finance and the state creditors had come to an understanding respecting the price at which the new Three per Cent. Stock should be issued. The latter it appears had consented to accept it at 35, and agreed to deliver up the bills, coupons, and other securities which they had received as guarantees from the Government.—A Barcelona paper says that the Count de Trapani, the brother of the King of Naples, is daily expected at Barcelona, and that it is believed the marriage question is at length decided in his favour. The Queen's health however seems to be in a very unsatisfactory state, and her illness is said to be of a nature which gives no hope of amendment. It was rumoured at Barcelona that a new citadel was about to be erected on the ground lying between Sarria and Gracia, so as completely to hem in the city by a circle of forts.

PORTUGAL.—We have advices from Lisbon to the 20th inst. The wine exportation of Oporto and Madeira was depressed beyond all previous experience within living memory. So frightful was this depression, that good wine was unsaleable at 5*l.* per pipe; and though the Portuguese Government had attempted by decree a violation of our commercial treaty with regard to their colonial trade, the tariff convention was evidently coming.—Lord Howard de Walden, our Minister at Lisbon, has written a letter to the Lord Provost of Edinburgh, on the subject of the recent sentence of death passed on a Portuguese woman at Madeira, for the sole offence of having embraced the Protestant faith. His Lordship states that "The Portuguese government have yet no knowledge whatever of this circumstance. The subject, however, on my bringing it forward unofficially, met with immediate attention; and I have received from the Minister of Foreign Affairs not only an explanation of the laws telling upon the case (from which it would appear that practically such a sentence is a mere matter of form), but also the positive and direct assurance, for my better satisfaction, that no member of the government could contemplate for an instant recommending the Queen to confirm such a sentence. Your lordship may be satisfied that the case of the woman has met with attention from their Majesties and the government, and that there is no question whatever either of the extreme penalty of the law, or any extraordinary severity being put into force against her."—Our countryman, Mr. Tozer, is still in prison at Lisbon, without any indication of an approaching trial, although he has been incarcerated for 67 days.

GERMANY.—A letter from Berlin of the 15th inst. states, that there was every probability that the commercial treaty concluded between Prussia and the United States of America would not be ratified.—According to the last census, the population of Bavaria amounts to 4,440,327 inhabitants, 69,746 of which are military.—A serious riot took place at Ingolstadt, in Bavaria, on the 17th. The labourers in great numbers attacked the brewers, bakers, and butchers, and it was with great difficulty the riot was put down. The *Augsburg Gazette* says, that from four to five thousand persons were engaged in it. The cause of the disorder was the arrest of a workmen by an agent of police. The workman resisted, and the police agent killed him with his sword. This exasperated the people, and they immediately attacked the breweries.—A Dresden letter of the 8th inst. states, that the son of Weber, the composer, was on the point of setting out for London, to bring back the mortal remains of his father, deposited in the Catholic chapel, in Moorfields, the clergy of which have generously offered to pay the whole expense of the transport, while a committee has been formed for receiving the body with all solemnity, and for erecting a monument to the memory of the author of *Der Freyschutz*.—Mr. T. Ralphs, courier to the King of Hanover, while on his voyage in the Caledonia last week from London to Hamburgh, with despatches, committed suicide on board the steamer.

ITALY.—The Malta papers of June 12 publish a citation issued by the Tribunal of the Austrian Navy against Barons Attilio and Emilio Bandiera, of Venice, the two sons of Admiral Bandiera. They are called on to appear before the tribunal within the space of three months, to justify themselves from accusations of desertion and high treason in belonging to the party of "Young Italy." The order states that, in the event of non-appearance, they would be condemned by default. The brothers Bandiera replied, in a letter from Corfu, dated May 19, that they had made their choice between the cause of their country and that of a foreign power which oppressed it, and gloried in their persecution.

GREECE.—We have received Athens papers of the 10th inst., which state that perfect tranquillity reigns through all parts of Greece. The province of Maina was at one time threatened with some disturbance, which has been avoided by the good sense and moderation of the chiefs, who have themselves shown a praiseworthy readiness to submit to the laws, and to induce their followers to imitate their example.

RUSSIA.—Letters from Stettin dated the 15th inst. state that the Emperor of Russia, the King of Prussia, the Prince Royal of Prussia, the Dowager Grand Duchess of Mecklenburg Schwerin, and her daughter, had arrived in that town, and that the Emperor and the two Princesses had embarked for Swinemunde, where a steamer was in waiting to convey them to St. Petersburgh. The King and Prince of Russia returned to Berlin. The Emperor's sudden return is said to be caused by the serious illness of the Grand Duchess Alexandra, the wife of Prince Frederick of Hesse.—A letter from St. Petersburgh says, that in consequence of a remonstrance made by the English Government respecting the bad quality of the tar sent from Russia, the Emperor has issued an order to the manufacturers of tar, that they shall be subjected to severe penalties in case the quality of the tar should henceforth be found bad.

TURKEY AND EGYPT.—We have advices from Constantinople of the 7th. The journey of the Sultan had commenced, and continued under the most favourable auspices. His Majesty had successively visited Ismith, Moudania, Brousa, and the Dardanelles, and was, by the last accounts, at Mytelene, which he intended to leave on the 8th to return to Constantinople. The revolt in Albania was considered at an end. Harassed in every direction by the Turkish troops, the rebels were unable to defend Uskup, their stronghold, which was entered by the former without any resistance, and Redschid Pasha was waited upon by the principal leaders of the movement, who surrendered at discretion, merely demanding a general amnesty in favour of their adherents. It was rumoured that, in consequence of the tranquillity now reigning in the provinces, the Turkish Government has determined to take advantage of the opportunity to put an end to the divisions still existing between the Druses and the Maronites, and that the admiral of the fleet has received instructions to that effect.—Letters from Alexandria of the 6th inst. state that Egypt continued to enjoy perfect tranquillity. Mehemet Ali was living in a country seat on the banks of the Mahmoudich canal, where he received frequent visits from the European Consuls. Sir H. Hardinge was shortly expected, and would proceed to India in the Hindostan steamer, which was to reach Suez about the 12th inst.

TUNIS.—The *Presse* publishes the following from Tunis, June 6:—"The sentence of death pronounced April 12 upon the English subject, Paul Xuereb, was executed yesterday. The man was strangled in his cell, at the prison of the Goletta. None of his fellow-countrymen being willing to be witnesses of his execution, Sir T. Reade was obliged to content himself with the employment of the brother of his own valet to be present, and testify in due legal form the fact of the proceeding. The triumph was complete, and Sir Thomas must now be satisfied. Happily our flag has not been stained by a deed so disgraceful to Christianity, M. de Lagan having taken care that it should not be hoisted during the day, either in the roadstead, from which the Camelion went expressly away, or over the office of the Consulate-General at Tunis."

UNITED STATES.—We have accounts from New York to the 5th inst., by the ship Tarolinto. A very important correspondence has been presented to the Senate by President Tyler, which shows conclusively that a stipulation on the part of the American Government, pledging to Texas her support against Mexico, was required by and given to Texas as a *sine quâ non* before the commencement of negotiations. The documents are accompanied by a message from Mr. Tyler, and a letter from Mr. Calhoun.—The subject of the next presidency forms a prominent and absorbing topic. It appears to be fully expected that Mr. Clay will succeed, and along with his accession a continuance of the present restrictive tariff and limited intercourse with Great Britain. Mr. Polk, one of the candidates for the presidency, has published his opinion in favour of "immediate re-annexation." He also urges the establishment and maintenance of the authority and laws of the United States over the Oregon, and that it be not permitted to Great Britian or any other foreign power to plant a colony on, or hold dominion over, any portion either of that territory or Texas. President Tyler also appears in print at great length, accepting most gratefully his nomination to the Presidency by the Democratic Convention of Baltimore. He complains bitterly of the denunciations hurled at him from all parts of the country, and says, that if two candidates for the Presidency, whom he does not name, had co-operated with him in the annexation scheme, his name would have been withdrawn. He says in conclusion, that in the consummation of that measure the aspirations of his ambition would have been complete, and that the poor and contemptible desire to be in office for the mere sake of office, however exalted, would have had no effect upon him.—Great damage had been done by the floods on the Mississippi.—Accounts from Hayti state that revolution has been

followed by general anarchy; the successor of Boyer has been superseded by Guerrier, an old General of Christophe. A General, named Acaau, felt indignant at this having taken place without his being consulted, and issued a counter-proclamation; he was in possession of Cayes; his followers are represented to be about 500 ragged men, badly-armed but perfectly under his control; he had flogged many of the prisoners in Fort, Boyer unmercifully, and had others shot. With his own hand he is represented to have shot six, and is said to be one of the greatest monsters that ever existed, and his natural ferocity is said to be much increased by an immoderate use of rum. The squadrons of England and France are actively employed in protecting the interests of their respective countries; but it does not appear that British subjects have been maltreated or threatened.

Parliament.

HOUSE OF LORDS.

Friday.—On Lord BROUGHAM's motion for the third reading of his Debtors and Creditors Bill, their lordships were occupied several hours in discussing the comparative merits of the respective Bills of Lord Cottenham and Lord Brougham, for the amendment of the laws relating to bankruptcy and insolvency.—The LORD CHANCELLOR proposed to terminate the controversy by referring both Bills to a select committee, in order that the best of the two might be selected, or a better measure compounded out of both.—Lord COTTENHAM, whose Bill stood for third reading, pressed his measure, on the ground that reference to a committee would prevent its passing during the present session; but, on a division, was opposed by 28 to 4, and his Bill, along with Lord Brougham's, was referred to a select committee.

Monday.—Lord POWIS moved that their lordships should go into committee upon his Bill for preventing the threatened amalgamation of the sees of St. Asaph and Bangor.—Lord MONTEAGLE, at some length, defended the course adopted by the Ecclesiastical Commission, of which his lordship was a member, and wished to know if the necessary consent of the Crown had been given to the Bill.—The Duke of WELLINGTON answered that he had not then the authority of her Majesty to signify her consent, but that it might be given at any future stage. His Grace did not mean to give any opposition to the motion for going into committee, nor to throw any difficulties in the way of amending it; but after the Bill came out of committee, he should then state the course which the Government would think fit to pursue.—The Bill was supported by the Bishops of BANGOR, SALISBURY, and NORWICH, and went through committee without amendment.—The Bishop of Exeter's Bill for the Suppression of Brothels then came under discussion, and elicited from Lord FITZHARDINGE a repetition of the charges he had on a previous evening made against the Dean and Chapter of Westminster. He accused that reverend body of being the largest holders of the description of property with which the Bill proposed to deal; and, quoting the third clause, showed that if the measure became law, both Dean and Chapter might, as landlords, be proceeded against and punished as severely and as certainly as their tenants. He trusted that if they would legislate at all, they would legislate fairly; for if, while vice was punished, those who shared its wages escaped, the public voice would declare that they had not done even-handed justice.—The Bishop of GLOCESTER, as a member of the Chapter, stood up in its defence, and explained that the houses in question had all been let on leases for 40 years, which gave no power of interference so long as the rent was punctually paid. As soon, however, as the term expired, not only had fresh leases been refused, but several of the houses had been pulled down, and in some cases the Dean and Chapter had bought up the unexpired terms of the leases, and purchased additional houses in the neighbourhood, lest they should, in the hands of less scrupulous landlords, be applied to immoral purposes. He complained of the attacks to which the Chapter had been subject, both from Lord Fitzhardinge and a portion of the public press; but promised in conclusion that he would at the next chapter meeting, recommend that a clause should be introduced into every lease prohibiting the conversion of the premises to the immoral purpose the Bill was intended to suppress. The Bill then went through committee.

Tuesday.—The Earl of RADNOR called attention to the letter-opening system at the Post-office, and moved for a copy of the warrant of the Secretary of State authorising the recent transactions.—The Duke of WELLINGTON opposed the motion on the same ground urged in the House of Commons, that the Secretary of State had the power, which was exercised on his responsibility, and that it was not advisable to give explanations.—Lord TANKERVILLE cited the example of Mr. Fox, who had signed a minute, in the time of Lord George Gordon, authorising the opening of the letters of the foreign ministers.—The Marquess of CLANRICARDE censured severely the conduct of the Government in the recent cases.—The Earl of HADDINGTON admitted that the power was an odious one, but it was necessary, and could only be exercised by confidence in the Minister to whom it was entrusted. There were no grounds for a parliamentary inquiry.—Lord CAMPBELL would have been satisfied had some assurance been given that no abuse of the power had taken place; but all the information they could obtain was, that the Home Secretary refused to tell them what occurred, and that the other Ministers knew nothing about it. The character of the country was compromised by what had taken place.—Lord CHIEF JUSTICE DENMAN considered that it was imperative on Parliament to inquire into the nature of a power so odious that the people would not endure its longer existence without modification. He did not look upon this as a question of expediency or inexpediency, but as a question of right and wrong. He could not conceive it to be more necessary to prove that it was wrong that such a power as this should be exercised in such a way, than to prove it to be wrong to pick pockets. As to Mr. Fox, considering that he came into office at a time when all Europe was in league against England, and that England was by no means at peace within herself, there might very likely have been good grounds for resorting to the exercise of this power; but did such grounds exist now? But even under the pressing necessities of his situation, he was convinced that the exercise of this power must have cost Mr. Fox many bitter feelings of regret and disgust. To any man of honourable feelings the exercise of such a power must be in the highest degree repugnant, placing as it must before him the private affairs of families, who, above all things, perhaps, desired that a knowledge of those affairs should remain sacredly limited to their own circle; and with members of which family the minister himself might perhaps that very day associate. He could not help thinking, too, that the very possession of this power, and the habit of exercising it, and especially under circumstances such as those described in that morning's newspapers, involving not merely concealment, but something very like forgery, must have a tendency to demoralise the mind. He could not conceive but that the possession and arbitrary exercise of such a power on the part of the head of the department, must have an effect upon the subordinates at the Post-office, very far from calculated to preserve the sanctity of general correspondence, even in cases to which the warrants did not apply.—The Duke of WELLINGTON: Repeal the statute.—Lord DENMAN was not quite sure it would not be as well to do so, but, at all events, it was manifest that some restrictions should be placed on the exercise of the power, and certain rules be laid down for the guidance of the Crown officers.—The Earl of DEVON could conceive no possible end which could be obtained by the production of the warrant, which was conceived in the same formal way in which all similar warrants heretofore had been drawn up, and he should therefore vote against the motion.—The Earl of RADNOR then withdrew his motion, because he intended to bring the matter again before the House in some decided shape, the nature of which he would state on a future occasion.—Lord WHARNCLIFFE moved the second reading of the Charitable Bequests (Ireland) Bill, the object of which was to re-constitute the commission on charitable bequests in Ireland, to render it more impartial, in the opinion of the Roman Catholics of that country, and to provide that any person wishing to make a provision, by bequest of land or other property, for the Roman Catholic clergy, might constitute the commissioners trustees of such property, for the benefit of the individuals to whom it applied.—The Bishop of EXETER, the Earl of WICKLOW, Lord MONTEAGLE, Earl of HADDINGTON, Lord HATHERTON, and the Marquess of CLANRICARDE, supported the Bill, which was read a second time.

Thursday.—The Presbyterian Marriages Bill passed through committee. A great number of petitions were presented against the Dissenters' Chapels Bill, and the Bishop of LONDON intimated his intention of objecting to it upon its return from the House of Commons.—The Marquess of CLANRICARDE called attention to the operation of the Poor-law in Ireland, and moved for documents calculated to illustrate the real nature of the system.—The Duke of WELLINGTON admitted that there was reason in the complaints urged in Ireland against the law. A committee of the House of Commons was inquiring into the subject, and as soon as it had made its report the Government would adopt measures to correct the evils. He consented to the production of the papers.—The motion was agreed to, after a few remarks from the Earl of MOUNTCASHEL, who said that the Poor law was unpopular with all classes in Ireland.

Friday.—The Irish Marriages Bill was read a second time *pro formâ*.—The Sugar Duties Bill was read a first time.—The Earl of RADNOR presented a petition from M. Mazzini, complaining that his letters were wrongfully broken open at the Post-office. The noble lord supported the prayer of the petition, and said he would give notice of motion on the subject on a future day. He wished to know if any warrant had been issued for breaking open the seals of M. Mazzini's letters?—The Duke of WELLINGTON could not answer the question, because he had received no notice on the subject.—Lord RADNOR then gave notice of his motion for Thursday next.—After a few remarks from Lord BROUGHAM, Lord CAMPBELL said he was of opinion that the Act of Parliament did not authorise espionage, and the breaking open of letters, re sealing them, and then sending them to their destination.—The LORD CHANCELLOR intimated that one warrant was sufficient to authorise the opening of any number of letters addressed to one individual for a certain period; as notice of a motion on the subject had been given by a noble earl, the question would, when that motion was before the House, be better discussed on that opportunity.—Lord CAMPBELL said the existing Act provided that a warrant should be issued in each case when a letter was to be opened.—The LORD CHANCELLOR said that, to do that the Secretary of State would have to go to the Post-office, and put his finger on a letter, and say "Open this."—Lord DENMAN thought there was another mode. They established a system of espionage at the Post-office. A spy might write to the Secretary of State, and say, "You will receive a letter from Portsmouth on such a day." He felt that the Secretary could not conveniently exercise this enormous power, unless he stopped every letter on a certain day. If the Act of Parliament was difficult to be carried into operation, so much the better. Such Acts ought to be difficult in being carried into operation. The circumstances of this particular case which had come to the knowledge of their Lordships made it most imperative on the Government to introduce some new measure, to render the law clear on the subject. (Left sitting.)

HOUSE OF COMMONS.

Friday.—On the question for going into committee on the Dissenters' Chapels Bill, Mr. PLUMPTRE expressed his sorrow and surprise that such a Bill as this should have received the sanction of Government. Had it been proposed by Lord J. Russell when he was in office, it would have received strenuous opposition; and in comparison with it, the appropriation clause was honesty and purity. The Christian people of this country felt deeply the wound inflicted by the Bill; and he had clung to the hope that it would be abandoned. He moved that the order for going into committee be discharged.—Lord J. RUSSELL did not doubt Mr. Plumptre's sincerity; he himself had been warned by constituents, no doubt equally sincere, that he would lose their support if he continued his support of the Bill. But further consideration only strengthened his conviction in its favour. If Unitarians were not to receive equal consideration with other Dissenters, then let toleration be the exception, rather than the rule—he, however, would call it persecution. If the Unitarians were not to be secured in possession of the property now in their hands, he knew of no other body of Dissenters who could establish their claim to it; and in doing justice we had no right to look at the religious opinions of the parties. Though the Unitarians were not legally tolerated till 1813, practically they enjoyed it long before; and had the question involved in this Bill arisen in the time of Sir R. Walpole or Lord Chatham, they would have dealt with it on the same principle as it is now proposed to settle it.—Sir R. PEEL said that the Government had treated this question as one of property, not of faith; they were not endowing Unitarianism, but deciding a controversy as to rights of property by that rule of prescription which is the foundation of justice. Therefore, notwithstanding unpopularity and misconstruction, they were still perfectly convinced that their course was one right in itself, and fair to all parties.—After some further discussion, in which several members joined, Mr. Plumptre withdrew his amendment, and the House went into Committee on the Bill. The first clause was agreed to. On the second, Mr. SHAW moved an amendment, the specific object of which was to enable the Synod of Ulster to claim certain endowments alleged to be founded for Trinitarian doctrines, and which he urged belonged to them on every principle of law and equity. This was opposed by the Solicitor-General and Sir R. Peel, and on a division was negatived by 161 to 43.—Mr. SHAW then moved that "sixty" years should be substituted for "twenty-five" years' usage. This, however, was not pressed to a division.—The ATTORNEY-GENERAL, in answer to Mr. S. O'Brien, said that occupation of a chapel by the adherents and teachers of a specific form of doctrine and worship during twenty-five years would be taken as evidence of "usage." This point raised discussion, and the ATTORNEY-GENERAL promised to consider the terms of the clause, with a view to render it as complete as possible, and prevent the possibility of its being perverted to the purposes of creating a new test. The second clause, after prolonged discussion and division, was ultimately carried by 188 to 62.—Lord ASHLEY wished to replace clause three by another, which would have the effect of enabling a separation to be made between the Trinitarian and Unitarian bequests in an endowment; but being met by an objection in point of form did not press it. The third clause was agreed to; and the Bill having been gone through, was ordered to be reported, a loud cheer marking its passing this stage.

Monday.—Mr. T. DUNCOMBE presented a petition from Charles Stolzberg, a Polish refugee, complaining of the opening of his letters by the Post-office authorities. The hon. Member stated at length the grounds of complaint made by this gentleman, as well as by Mr. Mazzini, whose complaint had been before the House a few days ago. Mr. Mazzini asserted that from 60 to 70 letters addressed to him had been opened since the beginning of March last; that, in opening his letters, every care had been taken to avoid suspicion; that impressions had been taken from the seals, and from these the opened letters were re-sealed; and that the cut was made so clean, that it required a microscope to discover it. There were also, he said, double impressions made with the Post-office stamps, so that the date when the letters were received at the Post-office might not appear. Both Mr. Mazzini and Mr. Stolzberg denied that their correspondence contained anything to warrant such espionage. Mr. Duncombe said that this violation of correspondence, as he could prove, had been carried on to a very great extent during the last two years. He charged the Post-office authorities with maintaining a secret letter-opening machinery, and accused the Government with not only conniving at it, in order to make a political use of the information thus surreptitiously obtained, but with exceeding the powers of the law in authorising it. He moved that the petition be referred to a select committee, in order not only to inquire into its allegations, but also into the system.—Dr. BOWRING seconded the motion.—Sir J. GRAHAM complained of the want of courtesy manifested in his not being fully apprised of the whole circumstances of the case, including the name of the petitioner, before it was brought under the consideration of the House. He had been merely informed that another petition was to be presented. No man respected public opinion more than he did, or wished more to stand well with his fellow-countrymen; but, occupying a high and responsible situation, he would not allow regard for his private character to overcome his sense of what was due to the public security and service. He would, therefore, stand on the fact that the law vested such a power in the Home Secretary. Any person opening letters in the Post-office, without authority, was liable to indictment for a misdemeanour; the Home Secretary was open to prosecution, if he had exceeded his powers; and, denying that he had done anything questionable, he demurred to an inquiry, either by the House of Commons or by a select committee.—Mr. MACAULAY thought that Sir J. Graham did not seem to be aware of the grave nature of the question which had been raised. Now that their attention had been thus called to it, this was a power which could no longer be suffered to exist, without great modification. A letter in the Post office ought to be as sacred as one preserved in a desk; it was merely confided to Government for the purposes of transit, and certainly was not intended for the purposes of a secret police. The letters of Wilkes were taken out of his desk, and he recovered 1000*l.* damages against the then Home Secretary. No reason could be alleged for the defence of this letter opening practice, which could not also be urged in defence of the spy system in the worst of times; and it would be better that, occasionally, even a great crime should be committed, than that such a practice, shrouded in secresy, should be suffered to exist, and all private correspondence be placed at the mercy of a vague suspicion on the part of an official, or to gratify a continental despot. Two years ago the disturbances in the manufacturing districts were ascribed to the machinations of the Anti-Corn-law League; everybody knew that it was utterly unfounded, yet the correspondence of thirty or forty gentlemen might, on such a suspicion, have been submitted to the inspection of the authorities. If Sir J. Graham had been able to contradict the allegations that there were duplicate seals, and a regular system for opening letters undetected at the Post-office, no doubt he would have done so. In the case brought under their notice, the character of the country was involved. An Italian, who believed that he could, with a freedom unknown in his own country, commit his thoughts to the safe guardianship of the Post-office, found his correspondence violated; and as there was no Bill before the House for taking away this power, the next best thing he could do was to support the motion for an inquiry.—Captain BERNAL said a rumour was abroad that Irish correspondence was habitually violated, but Sir J. Graham, wrapping himself up in the tattered garments of his public virtue, refused all explanation.—Lord SHELBURNE suggested that when a letter was opened it should be afterwards forwarded without any attempt to disguise the opening.—Sir R. PEEL vindicated the course taken by Sir J. Graham. This power had subsisted from the time of Queen Anne; and the present act, a modification of the old law, had been passed in the time of the late Ministry. If it ought to be altered, let its alteration be moved upon notice for leave to bring in a Bill. The Secretary of State, if he had answered the questions in this case, would have exposed himself to be called upon by every man who should at any time suspect that he had had a letter opened.—Lord J. RUSSELL did not think that Sir R. Peel had altered the complexion of the case. Sir J. Graham might have imitated the conduct of Sir R. Walpole in the case of Bishop Atterbury, and contending that the power was necessary for the public safety, with respect to *internal* dangers, have given some general indication of the principle on which he acted, without entering on details. It would be a most unjustifiable use of this power if it were exercised to oblige foreign Governments; and it would be no derogation of the position or dignity of Sir J. Graham if he were to submit to an inquiry. The Home Secretary might be no more to blame than Lord Melbourne was in the case of Coffey the policeman; but responsibility was at an end if a Minister refused all explanation, and sheltered himself behind a majority.—Mr. M. MILNES regretted that Sir J. Graham had not felt it consistent with his duty to state whether or not it was for the use of foreign Governments the information was sought. It was however a question of confidence.—Mr. SHEIL thought that enough had come out, even from the admissions of the Government, to justify investigation. Why should Sir J. Graham stand on his own self-will? It had been boasted four months ago, in the *Augsburg Gazette*, that Mazzini was under the surveillance of the London police. The charge against them was, that they had resorted to the un-English practice of violating the correspondence of an exile, who had taken refuge amongst them, and this in order to gratify a foreign Government; and the English community revolted at the idea that the privacy of their affections and afflictions should be open to the inspection of the Home-office.—Mr. S. WORTLEY defended the Government.—Mr. WAKLEY said that it had been complained that the particular name, in the case before the House, had not been previously communicated. Was it not a fair inference from this, that the practice was a common, every-day one? Worse than employing spies was the odious practice of prying into people's letters, at the nod or beck of somebody. Sir J. Graham refused all explanation, and retired on responsibility. But responsibility was accountability; and how could they make the Home Secretary accountable without an inquiry? The petitioners only asked to find out the scoundrels who had employed Sir J. Graham; the independence of the House—if it had any left—was at stake; and Sir J. Graham, who was one of the loudest of the ironical cheerers, when Mr. Ferrand "demurred" to the tribunal of the House, had himself "demurred" to it, and was therefore embarked with the member for Knaresborough in the same sinking boat. A sagacious old politician had said to him the other day, "A Government that employs spies is vastly odious; but I will tell you of a Government which is worse—a Government which makes itself a spy."—Lord HOWICK said, it was in vain to talk of appeals to courts of law; nobody denied the legal right; the question was one of Ministerial responsibility; and the refusal to answer was a serious blow to the principle of protection to foreigners. It was a refusal, too, which might lead in the times of future Secretaries of State even to the opening of the letters of their political opponents.—Lord STANLEY observed, that the supporters of the motion had all the popularity on their side, while the Ministers by their official responsibility were placed in fetters. Would you allow every individual who chose to say, but without any evidence, that he believed the Government had opened a letter of his, to demand a committee of the House of Commons? He protested against the unfounded and gratuitous assumptions made in this debate. Gentlemen complained of the manner in which the power had been exercised; what did they know about the manner of that exercise? Lord J. Russell would very properly refuse to answer if you asked him in what

cases he, when Secretary of State, had used this power; and with equal propriety Sir J. Graham had refused now. The case was like that of the secret service money, of the application of which every Government had refused to give an account. The power now in discussion, if fit to be intrusted to a Government at all, was one of which the whole value was bound up in its secresy. It was rarely exercised, and only on very special information; and it ought to be exercised without responsibility to this kind of interrogatories.—Sir G. GREY said that Lord Stanley had come boldly to the rescue, and not before his aid was wanted. The charge now made was that a power, given for one purpose, had been used for another; that it had been so used, not to protect from some plot the Queen or the Constitution, but to detect some unhappy exile, for the information of some foreign Government.—Lord SANDON amidst much interruption opposed the motion.—Mr. WYSE, on the other side, attempted for some time in vain to make head against a similar impatience, but at last obtained a sufficient hearing to state, that he had himself seen two of the letters in question, which, to his firm belief, bore marks of having been opened.—Mr. T. DUNCOMBE, in reply, excused himself from the imputed want of courtesy to Sir J. Graham in not having given fuller notice of this motion. He contended that he had made out a *primâ facie* case, and that therefore inquiry ought to follow. The House then divided—Against Mr. Duncombe's motion, 206—For it, 162—Majority against it, 44.—The third reading of the Sugar Duties Bill was postponed to Thursday.—On the motion for going into committee on the Bank Charter Bill, Mr. Alderman THOMPSON stated several objections which he had to the measure. He thought the issues of the Bank should be 16,500,000*l.*—Mr. WILLIAMS supported the Government scheme.—Mr. MASTERMAN said that the limitation of the circulation to 14,000,000*l.* would most certainly greatly restrict commercial accommodation, and would be extremely injurious to the commercial interests of the country.—Mr. MUNTZ, knowing the injurious effects which this measure would have upon the country, felt compelled to move the committal of the Bill that day six months.—Sir R. PEEL having stated his determination not to make any alterations which interfered with the principles of his Bill, announced the modifications he was willing to concede. He proposed to take, as the future maximum issues of country and joint-stock banks, the average of the twelve weeks immediately preceding the announcement of this measure. He also proposed that, instead of the weekly accounts of issues originally intended, the accounts should be made up monthly. He also proposed not to bring the limitation on issues into force until the 10th of October, and to fix the penalty for exceeding the legal maximum at an amount equal to the excess.—Mr. HUME approved of the measure. Mr. WODEHOUSE, General JOHNSON, Colonel SIBTHORP, Mr. MORRIS, and Sir W. JAMES, opposed it. The House divided—For Mr. Muntz's amendment, 18; for going into committee, 205; majority, 187. The House went into committee. On the second clause, Mr. NEWDEGATE moved that the words "securities upon 14,000,000*l.*" be omitted, and that 22,000,000*l.* be substituted, as the average of three years, but after a discussion, he withdrew his amendment, and the clause was agreed to. Clause 3 was likewise agreed to, and the Chairman reported progress.

Tuesday.—Among a great number of petitions in favour of agricultural protection one was presented by Lord STANLEY, signed by 17,000 manufacturers and agriculturists of the northern division of Lancashire. His Lordship stated that among these petitioners were 23 out of 47 of the principal manufacturers of Preston, employing 1588 horse-power out of 3522. It was also signed by 25 of the principal employers of hand-loom weavers in Blackburn and its neighbourhood.—In reply to Lord J. RUSSELL, Sir R. PEEL stated that the French Government had entered into full and unreserved explanations with the British Government touching the state of its relations with Morocco. The Government of France had voluntarily given the most positive assurances that it was their anxious wish to avoid hostilities with the Moors; they had likewise communicated their general views with regard to Morocco, and had apprised this Government of their general demands upon the Emperor, and the measures which they intended to adopt to enforce these demands, which of course included the general instructions given to the Prince de Joinville. Since those assurances from the French Government, telegraphic accounts of renewed hostilities had arrived, of which he knew no more than was conveyed in the despatch. Under the circumstances, he declined to state the nature of the instructions given to the Prince de Joinville.—Sir R. PEEL asked Mr. WYSE to postpone his motion on the Irish State Trials, which stands for next Tuesday, seeing that the writ of error was fixed for Thursday in the House of Lords, and the law officers of the Crown, especially the Irish Attorney-General, would be inconvenienced by having their attention withdrawn from it by a debate in the Commons.—Mr. WYSE said his motion related to a question of fact rather than of law; and as he had already postponed it, he was unwilling to risk any further delay.—Sir R. PEEL professed his willingness to give up a Government night, if necessary, for the discussion, after the writ of error has been decided.—Mr. WYSE then said he would postpone the motion, if he received a distinct assurance of aid in bringing it on afterwards.—Mr. VILLIERS then brought on his motion for the repeal of the Corn-laws. The advocates of protection were driven to imitate the organisation, without meeting the success, of the Anti-Corn-law League; and the continued discussion of the subject, while it took away all cause for despair, gave them much reason for hope. Their cause was based on truth and justice, and was gradually gaining ground, while that of their opponents was losing it; and the Anti-Corn-law League, by its continued efforts, was exerting an important influence on public opinion. The Corn-law had never yet been placed on any national or public ground. All the pretexts for it had been sifted and found wanting; the most plausible of them all, that of independence of foreigners, had been proved by facts to be the most foolish; for during the thirteen years of the existence of the Corn-law of 1828, we had imported 30,000,000 qrs. foreign grain, and after an experiment of 30 years with this protective system, we had during the last five years, instead of being able to depend on our own soil for bread, been compelled to buy 17,000,000 quarters from foreigners. It had been proved too that neither farmer nor agricultural labourer had the slightest interest in the maintenance of the Corn-law; and the farmers themselves were becoming universally convinced that it was an obstacle in the way of their prosperity. There never was a better time for the abolition of this law—free from political excitement, yet presenting a mass of social misery, calling for relief and amelioration—habitual associations connected with a good harvest, abundance of food, and plenty of employment, with a bad harvest, scarcity and distress. Why then quarrel with those who would make permanent the benefits associated with a good harvest? To blockade Grosvenor-square might seem ridiculous; not more so in principle than to shut up our Custom-house by a sliding scale, and confine an increasing population to the produce of a little island. If they were in earnest in their desire to ameliorate the condition of the people, they would aid him in getting rid of a law whose effects he traced, by comparative statistics, in the increase of crime, the extension of disease, especially typhus fever, and other calamities, all of which were aggravated by scarcity, and diminished by abundance. He also referred to the confessions and the legislation of Sir R. Peel since he last came into office; and after citing largely the opinions of agriculturists on the subject of leases, agricultural improvement, and so forth, he concluded a speech of upwards of three hours by moving—"That this House do resolve itself into a committee for the purpose of considering the following resolutions:—1. That it appears by a recent census that the people of this country are rapidly increasing in number.—2. That it is in evidence before this House that a large proportion of her Majesty's subjects are insufficiently provided with the first necessaries of life.—3. That nevertheless a Corn-law is in force which restricts the supply of food, and thereby lessens its abundance. 4. That any such restriction having for its object to impede the free purchase of an article upon which depends the subsistence of the community, is indefensible in principle, injurious in operation, and ought to be abolished. 5. That it is therefore expedient that the Act 5 & 6 Vic., c. 14, shall be repealed forthwith."—Mr. FERRAND, after descanting on a variety of topics, moved an amendment, the terms of which were a copy of the motion of Mr. Villiers, with the variation that machinery, not the Corn-law, was the cause of distress, and protection and encouragement to native industry its cure.—Captain BERKELEY condemned all associations as mischievous; but, acting on principle, he should vote as hitherto, with Mr. Villiers, and in repudiation of the sliding-scale.—Mr. GLADSTONE said it would be his duty to meet the motion of Mr. Villiers with a direct negative; and he hoped, therefore, that Mr. Ferrand would not place his amendment in the way of a direct "aye" or "no," on a subject of so much importance as the Corn-laws. He was not an advocate of extreme protection, but confidence in the stability of a law was essential to the complete working of a measure which, so far as it has been tested by the experience of two peculiar and unusual years, has realised the most sanguine expectations. In 1842 they had spent eighteen nights in fair, hard discussion on the Corn-laws; they could not renew it every year; and he claimed something like stability for the decision of Parliament. Sir R. Peel was accused of having promised a particular price to the farmer for his grain. He had done no such thing, he had merely indicated that it would be desirable, if it were possible, to keep the price between 54*s.* and 58*s.*; and in the three seasons from 1842 to 1844 these limits were not exceeded, and even the minimum, during the last year, had not been reached. Even Mr. Villiers was obliged to confess that, under this Corn-law, a foreign trade was maintained, not so extensive or so steady as he might desire, but sufficiently so for the supporters of the measure, which, in addition to its other merits, had realised a revenue, during the present year, of so much as seventeen shillings the quarter. The existing law had obviated the objections which applied to its predecessor. The motion was directed, not so much against it as against the whole protective system sanctioned by the policy of the country; and there was, therefore, but one course for Parliament to adopt, in putting a check to an agitation mischievous in its effects, by creating an impression of the instability of a law which ought to be considered as a settlement of the question.—Lord J. RUSSELL found himself, like Sir R. Peel a few evenings ago, in "no very enviable position." He was not prepared, either to say that the Corn-laws should be at once abolished, or that the existing law should be maintained. There were inherent vices in the present system which indicated its premature decay; and when Mr. Gladstone appealed to the two last years, he merely proved that the present Government, instead of being wiser, had only enjoyed much better weather than their predecessors. Would the existing Corn-law stand two successive bad harvests? It violated the commercial principle; while a fixed duty, whatever might be its amount, six, eight, or ten shillings, enabled the merchant to make his calculations with certainty. But he apprehended that a sudden repeal of the Corn-laws would cause panic, affect the employment of capital in agriculture, and lead to a greater importation than was consistent either with the profits of the importing merchant, or the security of the home cultivator. The only portion of the proposition of the Anti-Corn-law League which had the slightest claim to originality was the *immediate* abolition; all their other arguments had been anticipated by the masters of the science, Adam Smith, Ricardo, or such statesmen as Mr. Huskisson or Lord Grenville, who, however, guarded their views by great caution as to the mode of arriving at their accomplishment. He regretted that he could take no part in the present motion, and heartily wished that some compromise could be effected which might have the effect of subduing agitation; if trade and commerce flourished, the landed interest need not be afraid of decay. The better way would be to revise the whole system of our protective duties, instead of dealing in perpetual harangues against the Corn-law, the maintenance of which was more desired by the farmers, than by the landlords themselves. But he could see no end to agitation so long as the Government were determined to maintain the existing law.—Mr. MILES commiserated the position of Lord J. Russell, thanked Mr. Gladstone for his straightforward, honest speech, and called on country gentlemen to listen to no compromise at all. The Anti-League was merely a defensive, the Anti-Corn-law League an aggressive association, whose interference, however, at elections had proved anything but a successful experiment. The working population were well aware that the object of the League was to cheapen bread in order to lower labour—a conclusion which none of their speeches, pamphlets, or papers, attempted to meet, while the prices at which foreign grain can be imported, showed that utter ruin waited the farmer if free importation were immediately permitted. He adduced a statement, signed by three practical farmers, contradicting Lord Ducie's statements as to the expense of growing Wheat on the Cotswold Hills, and denied that the Corn-laws constituted a landlord's question.—Lord HOWICK expressed his regret that the motion of Mr. Villiers was put in an inconvenient form; but seeing that the question was now between the existing law and a total repeal, he felt it to be his duty to support it. The inadequate reward of industry—the low rate of wages and of profits—was attributable directly to the Corn-law. This state of things arose where land was limited in proportion to the population; the reverse where land was abundant, and presented a field for the employment of capital and labour. Protection interposed between the labourer and the free exchange of his labour to the best advantage, and was, therefore, a gross injustice. The noble Lord concluded a lengthened speech by warning the House against perpetuating evils which, if unremoved, would generate greater mischiefs. Chartism, and other discontents, arose from no love of the Corn-law; though the working man might not support the Anti-Corn-law League, he demanded a fair day's wages for a fair day's work; and the institutions of the country were not safe without an amelioration of the condition of the labouring population. The debate was then adjourned.

Wednesday.—Mr. T. DUNCOMBE gave notice, for Tuesday night, to move for a select committee to inquire into the department in the Post-office, commonly called the Secret Office, the duties of the persons employed therein, and the authority under which the functions of the said office are discharged.—The adjourned debate on the Corn-laws was resumed by Mr. S. O'Brien, who read copious extracts from speeches, newspaper articles, pamphlets, &c., in order to give an historical view of the proceedings of the Anti-Corn-law League, whose conduct and operations he ridiculed and condemned. Out of the entire amount it had collected, there were, he said, no less than 156,000*l.* of the expenditure of which no detailed account had been given. It had been singularly unfortunate in its election experiments—all its successes were at first, but its reverses have come last. After six years of agitation, carried on with great resources, ability, and energy, the League found that the practical good sense of the English people was proof against its machinations; the poor were not with it; and he thought he had succeeded in exposing its mischievousness and folly.—Captain LAYARD, when in China, had condemned the practice of crippling the female foot, but was told that the old women who made a living by it prevented the abolition of the practice. There, for the benefit of a class, the women were put on short steps; here, for the benefit of another class, we put the people on short commons. He amused the house by observations on Mr. D'Israeli, and by relating his pleasure at having seen Sir R. Peel relaxing himself at the Opera, witnessing in the ballet of *Ondine* the "shadow-dance," which he compared to free trade flitting before the mental vision of the Premier. The motion of Mr. Villiers should have his support.—Colonel RUSHBROOKE spoke shortly on the condition of the agricultural peasantry of Suffolk, which was much better than had been represented, and to which the incendiary fires had been wrongly attributed.—Lord RENDLESHAM, Sir J. TROLLOPE, and Mr. G. BANKES spoke against the motion; Mr. WARD, Mr. M. GIBSON, Mr. HUTT, and Mr. COBDEN in favour of it.—Sir R. PEEL said they had been engaged that night for the benefit of the company which usually performed at Covent Garden Theatre. During the greater portion of the performance, the front rank of the Opposition benches had been deserted, their usual occupants absent, perhaps, from a lively recollection of the assistance given by the members of the Anti Corn-law League the other night at his benefit. Mr. Cobden complained of the habit of calling names—a bad practice, but one of which the League had set a prominent example, and, by attributing selfish motives to honourable men, had raised up that feeling of indignation which had greatly diminished their own power and influence. The moderate tone adopted in the present discussion was an indication that they felt the recoil of the weapons they had abused. The agriculture of this country was entitled to protection, from reasons both of justice and policy; there were peculiar and special burdens borne by the agriculturists; and there were not ten reflecting men out of the League who did not believe that a sudden withdrawal of protection, whether it were given to domestic or colonial produce, would cause great confusion and embarrassment. In the artificial state of society in which we lived, we could not act on mere abstract, philosophical maxims which, isolated, he could not contest; we must look to the circumstances under which we have grown up, and the interests involved. Ireland dependent on England for a market for her agricultural produce was a case in point. He was not prepared to alter the Corn-law of 1842, and did not contemplate it; and seeing Lord J. Russell had avowed himself a consistent friend to protection, and was opposed to total repeal, he thought he was somewhat squeamish in flying from his difficulty, and declining to vote against the motion. The noble lord, however, in arguing for a fixed duty had adduced a powerful reason for a graduated scale, when he expressed his fears that a total repeal would lead to a glut without cheapness, and ruin to the agriculturist without advantage to the community. Adverting to the alleged promise of a price from 54*s.* to 58*s.*, as the result of the Corn-law of 1842, he read the passage of his speech, to show that it bore no such construction. They were taunted with their "predictions;" but Mr. Cobden and his friends had uttered predictions of impending ruin to trade and commerce, which no modification of the sliding-scale could avert or protract. Yet since the passing of the law of 1842, there had been a great increase and improvement in all the leading branches of our manufacturing industry. Lord Howick affirmed the right of the working man to expect a "fair day's wages for a fair day's work," from the Legislature—a benefit which no Legislature could secure, and no state of society—as witness the United States—could permanently afford. He therefore deprecated the holding out expectations which could not be realised, and the disappointment of which might lead to dangerous results. As to the Corn-law, the Government did not intend to alter it, or diminish the amount of protection afforded to agriculture.—Lord HOWICK explained that what he did say was, that in a sound and wholesome state of society, not interfered with by artificial restrictions, labour would always secure its own reward. This was what he meant by allowing the working man to obtain a fair day's wages for a fair day's work.—After some remarks from Mr. E. ELLICE, Mr. BORTHWICK, and Mr. BRIGHT, Mr. VILLIERS said that there was nothing for him to reply to, since nobody had dared to controvert his arguments. Sir R. Peel had just made a speech with which the agriculturists were much pleased; but he had made the same sort of speech for them in 1839, and had thrown them overboard afterwards, because the state of the seasons and the distress of the people had made it indispensable to give some relief to the country. The same thing would happen again.—The House divided—for Mr. Villiers's motion, 124; against it, 328; majority against it, 204.

Thursday.—A discussion, in continuation of a former one, took place relative to the eligibility of Mr. Yorke to vote in the committee on the Middle Level Drainage Bill, counsel having suggested that the hon. member was interested in the Bill. A resolution to the effect that committees on private Bills were competent to construe the resolution of the House and to decide on the validity of the vote of any one of its members, was, on the motion of Mr. GLADSTONE, ultimately agreed to.—Sir W. JAMES asked if it were true that the wages of the agricultural labourers in Norfolk and Suffolk were but six shillings a week; and that, in some of the unions there, it was not customary for the board of guardians to grant relief unless the applicant produced a sort of round robin, signed by the farmers of his parish, to the effect that they had refused to give him work.—Sir J. GRAHAM replied that, as to the wages, he was not prepared to answer; but it was true that in the parish of Havering the board of guardians had laid down a rule, to require a certificate that the applicant had sought for work and had been refused. Until Sir W. James brought the matter before his notice, he had been unaware of the existence of such a practice. He heard of it with extreme regret, for he considered it to be a restraint upon relief not recognised by law, and most unjust to the applicant. The Poor-law Commissioners, he added, had received no previous complaint on the subject, but the moment they had notice of it they gave directions to their Assistant-Commissioner to interfere in the matter, and to communicate with the Board of Guardians, so that such a practice should be at once put an end to.—In reply to Mr. M. GIBSON and Lord J. RUSSELL, Sir J. GRAHAM stated that the approaching trials in Norfolk and Suffolk would furnish the most regular and efficient means of obtaining the real causes of the incendiary fires which have occurred in these counties; and that he did not think a commission of inquiry into their origin at present advisable.—On the motion for the third reading of the Sugar Duties Bill, a lengthened discussion ensued, in which Mr. HAWES, Mr. GLADSTONE, Mr. P. M. STEWART, Mr. MANGLES, Lord STANLEY, Mr. WARBURTON, Lord SANDON, Mr. BRIGHT, Lord J. RUSSELL, and Sir R. PEEL took part.—Lord J. RUSSELL thought it would have been better if the Government, in their alteration of the Sugar Duties, had reviewed the whole subject, as announced for next year. There was no fair analogy between the rescinding of the vote on the Malt-Tax, and the late one on the Sugar Duties; for the one had suddenly been carried in a thin House, and it affected the whole financial plans of the year, while the other had been long anticipated, and had been affirmed in a full House, and the consequences of its being carried could not have materially affected the revenue. The question on the rescinding was one between the character of the House and the pride of the Ministry; and the result was damaging to the influence and authority of a popular assembly, the independence of which had been thus destroyed.—Sir R. PEEL denied that there was any difference between the course adopted by Lord Althorp, in rescinding the vote for reducing the Malt Tax, and his own in the recent Sugar Duties vote. He was still conscientiously of opinion that the Government proposition was the best, both for revenue and consumer, and saw, therefore nothing discreditable in the House of Commons adopting, on reconsideration, the plan best sustained by reason and argument. He commented with sarcasm on the greater difficulties which free trade encountered from free traders than from advocates of protection; they asked for great measures, but opposed small ones, whether relating to cheese or sugar.—The Bill was then read a third time and passed.—The next order was the resumption of the committee on the Bank Charter Bill. After

good many proposed amendments, which were not pressed, and one division, clauses 4 and 5 were agreed to, and the chairman reported progress.—On the motion of Lord WORSLEY, a select committee was nominated to inquire into the expediency of facilitating the inclosure of commons and lands held in common, the exchange of lands, and the division of intermixed lands; and into the best means of providing for the same.

Friday.—Mr. GLADSTONE moved that the Joint-stock Companies Regulation and Registration Bill be committed *pro formâ*, with a view to the introduction of some amendments. The motion was agreed to, and the House went into committee.—Mr. GLADSTONE, having handed in the new clauses, moved that the House meet on Wednesday next, at 12 o'clock to proceed with the Bill. They had now arrived at that period of the session when a great economy of time might be effected by having morning sittings. He thought at this period of the year no objection would be offered to meeting in the morning. He wished to try the experiment of morning sittings. The motion for meeting at 12 on Wednesday next was agreed to, and the House resumed.—A number of petitions on various subjects were presented.—In reply to Dr. BOWRING, Sir R. PEEL said he believed there was an intention to lay an import duty on iron in the countries which formed the Zollverein, but he trusted that intention would not be persevered in.—Mr. B. COCHRANE inquired if any accounts had been received from Dr. Wolff respecting the fate of Capt. Conolly and Col. Stoddart, and whether the Government had given any assistance to Dr. Wolff?—Sir R. PEEL said there had been no direct grant made to Dr. Wolff, but the Government had rendered every assistance to aid him on his journey. Accounts had been received from Dr. Wolff since the question was asked a few evenings since, dated the 12th May, and also from Col. Shiel, her Majesty's representative at Bokhara, from which it appeared that no positive intelligence could be procured relative to Capt. Conolly or Col. Stoddart. It appeared, however, that no public execution had been heard of during the last two years, and it was the opinion of Col. Shiel's servant that Col. Stoddart was alive, and that he had embraced the Mahomedan religion; but this opinion was not given by Colonel Shiel himself.—Mr. B. COCHRANE wished to make a few observations with respect to the business of the House. He wished to know if the Poor-law Amendment Bill was to be postponed, to give way to the Dissenters' Chapels Bill, the Bank Charter Bill, and other Bills.—Sir R. PEEL said, personally to himself and his colleagues, it was of no consequence which measure was taken first; but it was of importance to the public interest that the Bank Charter Bill and the Dissenters' Chapels Bill should be passed without delay.—Lord HOWICK inquired when it was intended to proceed with the Irish Registration Bill?—Sir R. PEEL said he had hoped the Bill would have been carried through Parliament in time to refer to the registration of the present year, but in the state of public business he was afraid it would not pass into a law during the present session.—Lord HOWICK said it would be a great convenience and saving of time if the right hon. baronet at the head of the Government would state what Bills it was intended to press, and at once withdraw those it was not intended to proceed with.—Mr. M. O'CONNELL said he had never expected that it would have fallen to his lot to thank the right hon. baronet at the head of the Government for anything; but he did thank him for not persisting in carrying the objectionable Irish Registration Bill during the present session, and he hoped that he might have to thank the right hon. Bart., for not persisting in the Irish Municipal Bill which had been read a second time and stood for committee.—Sir R. PEEL said the Government was most anxious to proceed with all the public Bills which had been introduced, if possible, and he did not see why there should be any angry discussion respecting them. He would state next week the order in which he should propose to take different measures, and remark on the present state of business.—Sir J. GRAHAM said it was his intention to proceed with the Poor-Law Amendment Bill at the earliest possible opportunity.—The order of the day having been moved for the third reading of the Dissenters Chapels Bill, Mr. COLQUHOUN, at considerable length, opposed the measure. He considered it would, if passed into a law, prove very injurious to a numerous class of her Majesty's subjects, and he therefore moved, as an amendment, that the Bill be read a third time this day six months.—Sir R. INGLIS seconded the amendment.—[Left sitting.]

CITY.

Money Market, Friday.—Consols for the opening, closed at 98⅝. Red. Three per Cents. 99¼ Three-and-half per Cent. Red. 102⅛. Bank Stock 198½. Exchequer Bills 72*s.* to 74*s.*

GAZETTE OF THE WEEK.—BANKRUPTS.—W. R. READ, 30, Winchester-street, King's-cross, builder—J. HODGE, late of Drury-lane, but now of 24, Abchurch-lane, City, victualler—J. F. WOOD, Oxford, surgeon—C. F. OPPENHEIM, George-street, Minories, City, shipowner—R HODGSON, Bishop Auckland, Durham, mercer—Z. BOND, Manchester, brickmaker—S. ASKRAM, Bradford, Yorkshire, commission agent—T. ASHLEY, Lyonshall, Herefordshire, builder—T. WOLFENDEN and J. PRESTWICH, now or late of Oldham, Lancashire, cotton spinners—J. HOWARTH, Rochdale, Lancashire, woollen manufacturer—R. HOWLAND, Thame, Oxfordshire, auctioneer—J. WETENHALL, Throgmorton street, stock broker—C. HADFIELD, Sheffield, Yorkshire, anvil manufacturer—E. PRITCHARD, Liverpool, wine and spirit merchant—J FLETCHER, Liverpool, colour manufacturer—R. HETHERINGTON, Cross Canonby, Cumberland, tanner.

SCOTCH SEQUESTRATIONS.—J. M'CALLUM, Glasgow, auctioneer—J STEUART, Roanhead, Perthshire, farmer—J. FRASER, Edinburgh, mason—A. NISBET, Edinburgh, wright—W. M'EWEN and A. CHRISTIE, Crieff, ironmongers—J. MUNRO, Drynie, Dingwall, Ross-shire, distiller—J. ANDERSON, Glasgow, earthenware manufacturer—W. WALKER, G. DUNCAN, and H. WILLIAMSON, Edinburgh, engineers.

Metropolis and its Vicinity.

Election of Sheriffs.—On Monday, a Common Hall was held at Guildhall, for the election of Sheriffs for London and Middlesex, when Alderman Hunter, of Coleman-street Ward, and Mr. Sidney, tea-dealer, of Ludgate-hill, were unanimously elected. The Chamberlain, the Bridge-masters, and the other officers annually chosen by the Livery, were also elected.

Post-Office.—In connexion with the debates in Parliament this week relative to the practice of opening letters at the Post-office, a Liverpool paper states that few persons are aware how letters are opened and re-sealed by the Post-office. Wafers are opened by the application of moisture, and sealed letters are opened thus:—The letter is laid on an anvil with the seal up; upon the seal is laid a square piece of pure lead, and upon this lead descends a hammer with considerable velocity. The sudden impact converts the lead into a seal as faithful as an electrotype, and accordingly is used to re-seal the letter, which is now opened by destroying the wax bit by bit. For all letters similarly sealed the lead seal will do. A blunder in the management must have recently led to suspicion.

Loss of the Manchester Steamer.—This fine steamship, on her voyage from Hull to Hamburgh, was totally lost on the Vogel Sands, near Cuxhaven, at the mouth of the Elbe, during a gale of wind on the night of Saturday week, and all hands on board, including crew and passengers, were drowned. The Manchester, it appears, was about 300 tons burthen, and almost a new vessel. She was the property of the Hamburgh Steam Company, and has since the breaking up of the ice in the Elbe been running, in conjunction with the Leeds and Hamburgh steamers, in opposition to the Hull Company's ships, between that port and Hamburgh. She left Hull on Thursday the 10th inst. with a miscellaneous cargo, amongst which were large quantities of Lancashire goods, and it is reported between 20 and 30 passengers. The weather then was somewhat unfavourable, but not of such a character as to cause any fears for her safety; it is however certain that on her approaching the opposite coast she encountered a terrific hurricane. The pilots at Cuxhaven were on the look-out for her at the time she generally made that port, and her non-appearance at first did not excite alarm, as they supposed that, owing to the violence of the gale and the tremendous sea running at the entrance of the Elbe, Captain Dudley, the master, would keep out to sea for better security. The storm, it seems, commenced on the Thursday morning, and continued with unabated fury until Sunday morning, the wind blowing from north-west; and two vessels were lost in attempting to run for the harbour. The whole of Saturday and Sunday passing without any tidings being heard of the Manchester, alarm was naturally felt, not only at Cuxhaven, but also at Hamburgh, and her arrival was looked for with intense anxiety. The steamers which arrived from England brought no tidings of her, and at last portions of wreck were picked up at Cuxhaven, with a quantity of furniture, which proved to belong to the Manchester's cabin. A quantity of cotton print, a black board bearing the word "Manchester" in gilt letters, the hatches of the cabin, 50 pieces of velvet, a gold lever watch, the hands of which pointed to half-past 12; five bales of different goods, and a quadrant] case, with the name of the mate at full length were subsequently recovered. The steamer is supposed to have struck about 12 at night, at which time the Sands were covered, it being high water; and it is almost certain, from the boats which have been thrown on the beach, that the crew and passengers had attempted to land in them. The Sands are about 25 miles distant from the shore, and the nearest town whence assistance could be gained (Brunsbuttle), nearly opposite Cuxhaven, is full 30 miles off. The Marle Sand, the spot where the sad affair happened, is one of the most dangerous on the coast of Holstein. It is a quicksand, situate between the northward of the Vogel Sands and the entrance of the river Eider, and is as formidable to the mariner off that coast as the Goodwin is on the English shore. At low water it is high and dry, and there has not been known an instance of a vessel striking on it, and being ever afterwards seen, or her crew saved. The exact number lost has not been ascertained, but it is known that among the chief cabin passengers were a lady and her son and daughter, from Drogheda, of the name of Smith, who were about to proceed on a tour to Graffenburgh, for the benefit of their health; Mr. Richmond, of Paisley; and Mr. Rothery, a wool merchant, of Leeds. There were many others, to the number, it was reported, of from 25 to 30. The crew of the Manchester, besides Captain Dudley, included about 28 persons.

Thames Regatta.—This regatta, which was established last year for the professional and amateur watermen of the Thames, was celebrated last week with the usual spirit, and with the prospect of increasing patronage. The company was very numerous, and the *fête* passed off without any accident or the occurrence of unfavourable weather.

Royal Exchange.—On Tuesday a Court of Sewers was held at Guildhall, when, after a long discussion, it was carried by a large majority that the entire space from the end of Cornhill to the east end of the Royal Exchange, including the open space facing the west end, taking in the Wellington statue, should be paved with flag-stones. 1760*l.* was voted out of the consolidated fund for that purpose, and the pavement is to be laid down under the joint superintendence of Mr. Tite and Mr. Kelsey, surveyors of the commissioners.

The Wellington Statue.—The cost of this statue and pedestal was 9000*l*, the metal having been given to the committee by Government, and valued at 1500*l.*, in addition to that amount. The money was raised by a public subscription, after a meeting held at the Mansion House. The contract with Sir F. Chantrey was made in February, 1839, by the trustees, Sir P. Laurie, Mr. Masterman, Mr. A. K. Barclay, and Mr. R L. Jones, the work to be completed and fixed by 1843. Sir F. Chantrey, at his death, left the whole model complete, and also the head of the Duke the full size. The work has since been completed by his assistant, Mr. Weeks, under the direction of the executors. The statue is fourteen feet in height, from the feet of the horse to the head of the Duke. The pedestal on which it stands is of the red granite of Aberdeen, with the exception of the lower course, which is of gray granite. The pedestal is altogether fourteen feet high, so that the total height is twenty-eight feet. The costume of the Duke is said to be taken from that which he wore at Waterloo, but the tight pantaloons and the shapeless cloak bear no resemblance to any kind of costume in use at the present day. The Duke sits uncovered, without stirrups, like George IV. in Trafalgar Square, holding a roll of paper or a baton in his hand; and the horse, like that of his Majesty's, has his four legs on the ground. But for the inscription which will doubtless be added, it would be impossible for future generations to know for whom the statue was erected.

The Convict Dalmas.—It has been officially communicated to this convict that the High Sheriff has fixed Monday next as the day on which the extreme sentence of the law will be carried into effect, should he not be reprieved. Of this there is no prospect, an ineffectual application having already been made to the Secretary of State for a mitigation of the sentence. That application was referred to Baron Gurney, who presided at the trial, but who, it is stated, replied that there was no ground on which he could, consistently with his duty, recommend the prisoner to the clemency of the Crown. Dalmas has hitherto made no confession of his guilt, but, on the contrary, maintains his innocence, and says that he was confident of an acquittal up to the very moment when the jury returned into court with a verdict of guilty. He built his hopes upon the rejection of the dying declaration of Mrs. M'Farlane, and says that the rest of the evidence was of a purely circumstantial nature, which affected him in a very slight degree. It is said that Dalmas is an able chemist, has made a number of chemical discoveries, and is in the possession of some valuable secret relative to the properties of sulphuric acid, for which an eminent house in the City is in treaty with the prisoner's solicitor. The sum asked is 5000*l.*, to be appropriated for the benefit of his daughters; a handsome sum has been offered, but the exact amount has not transpired. Having been known to say that he would never die on a scaffold, he has been narrowly watched, and two turnkeys are with him night and day, and precautions are taken that nothing of an improper nature shall be conveyed to him.

Victoria Park.—The chief delay in the commencement of operations for the new park having been caused by six of the proprietors of land holding out against the Government award, the cases will be assessed in a few days at the Sheriffs' Court. The tenants of the houses on the site of the park have received notice to quit on Michaelmas-day, and those of the land, now the property of the Crown, will give up possession on the 1st October.

Infant Orphan Asylum.—The anniversary of this excellent charity was celebrated on Thursday at the Asylum, on Wanstead-heath. H.R.H. Prince Albert presided on the occasion, and after attending the examination of the children, partook of a *dejeúner* in honour of the day. Subscriptions and donations amounting to upwards of 2000*l.* were announced, inclusive of 100 guineas from his Royal Highness, and an anonymous contribution of 200*l.*

Accidents.—On Tuesday week, as the children of Dr. Hollis, of Lewisham, accompanied by their nurse, were taking an airing in a carriage, the horses took fright, ran off through the village, and when opposite to the residence of Dr. Brown leaped a fence into the waters of the Ravensborne, which runs through Lewisham, and were wedged in between the brickwork which forms the embankment. The nurse and children were picked up without sustaining any material injury. The wife of Dr. Brown, however, was standing at the drawing-room window when the horses plunged into the water, and the danger in which the children appeared to be produced such a fright that she never recovered the shock, and died on the 19th instant.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending June 22.—West Districts, 142; Northern, 191; Central, 144; Eastern, 213; Southern, 230; Total, 920. Weekly average for the last five years, 946.

Provincial News.

The Weather and the Crops.—The accounts from all parts of the country for some weeks past have given sad reports of the failure of the hay harvest; but within the present week rain appears to have fallen abundantly in the provinces, and to have refreshed the land, which had been previously parched up by the continued drought. This favourable change has already produced a decline in the grain markets, and if the rain continues the growing crops will soon recover the effects of the late sultry weather. Since Saturday last the temperature in and around the metropolis has been unusually high. On Saturday, at mid-day, the thermometer was above 70, and during the night the lowest point was 60. On Sunday there was a light breeze from the south-east, the air much charged with electricity. At two P.M., the mercury rose to 86 in the shade; and in the sun 107. At three o'clock there was a further rise to 87 in the shade; in the sun 112. At night the temperature fell considerably, but the heat continued very oppressive throughout. On Monday there was a fresh breeze from the west, but in the afternoon the mercury was nearly as high as on the preceding day. The great heat continued during the evening, but towards morning there commenced a heavy fall of rain, which continued through the greater part of the day, and must have been extremely beneficial. In other places, as at Liverpool, there have been severe thunder storms; but though the air about the metropolis was charged with electricity, the fall of rain has not been accompanied by thunder.

Bury St. Edmunds.—We recently mentioned that the proprietors of the *Times* newspaper had sent a reporter into Suffolk, for the purpose of collecting evidence respecting the incendiary fires. The reports made by him on this subject have attracted a great deal of attention, more particularly as they attributed the fires to the low wages of the labourers. It appears, however, that in the parish of Rattlesden, the principal inhabitants, farmers, and others have drawn up a document denying the statements of the reporter, and adding "that the inquiry has been conducted by an individual, who, in drawing up statements of distress amongst the poor, has taken the

most partial and biassed evidence on the subject, and has entirely omitted that which was opposed to the views of himself and employer. The editor of the *Times* has been guilty of a positive perversion of truth, in laying the blame of incendiarism upon the farmers, because low wages have been given to their labourers, and we are ready to disprove his statements before any competent tribunal. It is our confident opinion that the evidence upon which these statements profess to have been made, was collected and published for the purpose of exciting in the public mind feelings of opposition to the new poor-law. We are anxious and desirous that her Majesty's government should immediately issue a commission to inquire into the true condition of the poor in the agricultural districts, and into the causes of the alarming and increasing spirit of incendiarism which unhappily prevails."

Dover.—On the 19th the Trinity steam yacht towed off to its station on the Goodwin Sands, a stupendous safety beacon, designed and executed by Mr. J. Walker, President of the Institute of Civil Engineers, under the auspices of the Trinity Board. The beacon is intended not only to be a guide to mariners, but also a place of refuge for the crews of vessels cast away on the Goodwin. It consists of a strong iron column, about 40 feet high, based on a circular platform of solid masonry, the latter being upwards of 20 feet in diameter. The foot of the pillar is bell-shaped, and tapers upwards to the extent of some six or eight feet. About the middle of the column there is a platform resembling a vessel's top, surrounded with an iron railing, capable of receiving half a dozen men; and on the summit is an iron basket, constructed to contain a like number in case of shipwreck. The column is tied down to the stone work by iron stays, and on it are fixed steps, by which it may be ascended. The whole of the machine was incased in a huge timber vessel, resembling a brewer's vat, in which it was built, for the purpose of floating it to its station on the Sands.

Guernsey.—M. Dobrée, who had been committed to prison for having refused to answer certain questions connected with the recent rumours of a conspiracy, has been released by order of the Secretary of State, and the 600 troops who were sent over have been recalled. The people, however, are greatly excited by the insult which has, they state, been offered them by the authors of the alleged conspiracy, and the local papers state that a general public meeting will be shortly held, and the States be convened on the subject, in order that, by the united efforts of the people and the authorities, ample reparation may be obtained for the insults and injuries which have been heaped upon the loyal population of the island.

Keswick.—In October last a committee was appointed at a public meeting of the friends and admirers of the genius of Mr. Southey, when a resolution was passed that a tablet with a medallion be erected to his memory in Crosthwaite Church, Keswick. Since that time, however, the committee have altered their plans, for they intend to erect a shrine, with a recumbent figure of Mr. Southey upon it, from a design by Mr. Lough, and a lithographed copy of a drawing of the monument will be sent to each subscriber, with a list of the subscriptions. The subscription list is already signed by a great number of persons distinguished in literature.

Liverpool.—After experiencing the "law's delays," the Great Western steamer started from this port on Friday last. The uncertainty which existed until within a few days as to her departure prevented her obtaining a large number of passengers, but her berths were tolerably filled.

Newport.—It appears that the papers were in error in stating that Mr. John Frost, the Chartist, having been released from the degradation of working in chains like the other convicts, his wife and two daughters were on the eve of quitting England to join him. It is said that as Mr. Frost has been made a clerk in one of the Government offices, he entreats his wife not to entertain the idea of coming out to him, as he has grounds for believing that he will, ere long, receive a full pardon, and rejoin her and his daughters in England. Mrs. Frost has, in consequence, abandoned the idea of going out to New South Wales.

Portsmouth.—H.M.S. Wanderer arrived at this port last week with another portion of the Chinese ransom. It consists of 1,000,000 dollars in sycee silver, contained in 250 boxes, each box containing 2800 taels.

Romford.—On Monday the creditors of the Romford Bank attended at the Court of Bankruptcy, to choose the assignees. A general meeting had been held in this town on the previous Wednesday in reference to the same object. The court was crowded during the proceedings, and the great body of creditors present gave vent to their feelings of indignation at the conduct of Alderman Johnson, whom they openly accused of dishonesty in his dealings with them. The following were chosen assignees:—Mr. R. H. George, of Ilford, auctioneer; Mr. J. Meeson, of Grays, lime-burner; Mr. Woodford, of Hornchurch, brewer; and Mr. J. Cooper, of Westham, miller. Mr. Wilkinson, solicitor of the county bank, here observed that there was a very strong feeling amongst the creditors against the continuance of any allowance to either of the Johnsons, although they were perfectly willing to grant it to Mr. Mann, the other partner. After a long discussion on this point, the assignees proposed to allow Ald. Johnson 2*l.* a week, being half the sum allowed to Mr. Mann, and 1*l.* a week to Mr. Johnson, Jun., in order to mark their disapprobation of their conduct; but it was ultimately agreed to let the question stand over for the present. The amount of debts proved is about 40,000*l.*; but until the accounts are examined, it is impossible to know whether there will be any assets.

Wisbeach.—The village of Long Sutton, near this town, has for several days been in a state of excitement, owing to the discovery of the murder of two respectable inhabitants, named Crosby. It appears that Mr. Crosby and his wife, both of advanced age, had for some years occupied a small cottage in the village, and were in receipt of 100*l.* a-year. On Monday, the 17th inst. they were taken ill after breakfast, and died within a few hours of each other. At the inquest held on the bodies, it was clearly proved that the aged couple had died from the effects of arsenic, which it is supposed was put into the tea-kettle by a strange woman who entered the house while Mrs. Crosby was preparing breakfast, and who requested permission to rest herself for a short time, which was granted. The woman has not been discovered, although a reward has been offered for her apprehension. The jury, after a long consultation, returned a verdict "that the deceased persons came by their deaths from poison, administered by some person or persons unknown."

Worcester.—On Tuesday night, a man called Jabus Hooper, in a respectable sphere of life, living on his private means, murdered his brother's son, a young lad who was sleeping with him, and afterwards attempted to commit suicide by cutting his own throat. He is still living, though not likely to recover, and it is said that he is insane.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1397*l.*; Birmingham and Gloucester, 2318*l.*; Eastern Counties, 4463*l.*; Edinburgh and Glasgow, 2170*l.*; Great Western, 18,476*l.*; Grand Junction, 9152*l.*; Glasgow, Paisley, and Ayr, 1465*l.*; Great North of England, 1432*l.*; London and Birmingham, 18,570*l.*; South Western, 7366*l.*; Blackwall, 1555*l.*; Greenwich, 903*l.*; Brighton, 4213*l.*; Croydon, 514*l.*; Manchester, Leeds, and Hull, associated, 6879*l.* Midland Counties, 2960*l.*; Manchester and Birmingham, 3299*l.*; North Midland, 4547*l.*; Newcastle and Carlisle, 1702*l.*; South-Eastern and Dover, 4681*l.*; Sheffield and Manchester, 572*l.*; York and North Midland, 1723*l.*—In Mr. Laing's paper appended to the evidence taken before the select committee on railways, there is a table showing the rate of different items of expenditure per mile of railway upon some of the principal British and foreign lines. From this it appears that the Parliamentary expenses of the London and Birmingham and London and South Western Companies have been about 650*l.* per mile; of the Great Western and Manchester and Leeds, 1000*l.* per mile; and of the London and Brighton, 3000*l.* per mile. There appears to be no corresponding item in the accounts of the Belgian and French railways. The "law charges, engineering, direction," &c., have varied; but on all the lines they have been enormous. Thus the London and South Western Company have paid, under this item, 900*l.* per mile; Grand Junction, 1200*l.*; Birmingham, 1500*l.*; Manchester and Leeds, 1600*l.*; Brighton, 1800*l.*; Great Western, 2500*l.* It seems that the average on the Belgian railways, under this head, is 430*l.* per mile; and on the Paris and Rouen, 800*l.* Under "Land and Compensation," the Newcastle and Carlisle paid per mile 2200*l.*; Grand Junction, 3000*l.*; South Western, 4000*l.*; Manchester and Leeds, 6150*l.*: Birmingham and Great Western, 6300*l.* each; Brighton, 8000*l.* per mile. The average of the Paris and Rouen railway was 2300*l.*, and of the Belgian railways 2750*l.* In "Railway Works and Stations," the Newcastle and Carlisle cost 12,000*l.* per mile; Grand Junction, 15,000*l.*; South Western, 18,450*l.*; Birmingham, 38,280*l.*; Brighton, 38,000*l.*; Great Western, 40,000*l.*; Manchester and Leeds, 41,400*l.* The average of the Belgian railways is 10,600*l.* per mile; and of the Paris and Rouen, 17,000*l.* The "carrying establishment per mile" has been, on the Newcastle and Carlisle, 1300*l.*; Grand Junction, 2000*l.*; South Western, 2350*l.*; Birmingham and Brighton, 3000*l.*; Manchester and Leeds, 3600*l.*; Great Western, 4800*l.* The average of the Belgian railways is 2350*l.*, and of the Paris and Rouen, 2400*l.*—At a meeting of the Croydon Company on Wednesday, the shareholders, with only one dissentient, adopted the Bill which the Directors proposed to apply for during the present session for amending the Acts relating to the Company, and for authorising the laying of the atmospheric apparatus along the line. They also sanctioned, by a majority of 12 to 8, an agreement made by the Directors, to guarantee to the subscribers to the London and Chatham, and Chatham and Portsmouth Junction, interest at the rate of four per cent. upon the capital to be advanced by them, on condition that the profits of the line, after payment of such interest, be equally divided between the two companies.—On Wednesday, the Eastern Counties Company, almost unanimously, resolved to authorise the Directors to apply to Parliament in the next session for the necessary powers to extend their line from Hertford to Hitchin, Biggleswade, and Bedford. The report stated that after a proper deduction for working expenses, the revenue would yield a return equal to six and a half per cent. on the cost of the works, computed by Mr. Stephenson at 535,000*l.* for a double line.

IRELAND.

Dublin.—For some weeks past the Roman Catholic clergy have contemplated the appointment of a day of general humiliation and prayer, in connection with the imprisonment of Mr. O'Connell. It is now announced that the subject has been under consideration among a number of the Roman Catholic prelates now in Dublin, and that Sunday, the 28th of July, has been selected as a day of general humiliation and prayer among the Catholic population of Ireland. The bishops are to arrange a form of prayer to be used at church service during the entire period of the imprisonment.—The weekly meeting of the Repeal Association took place on Monday, Mr. J. H. Talbot, late M.P. for New Ross, in the chair. The Rev. Mr. Heron addressed the meeting at some length, as a deputation from the Repealers of Manchester, followed by Mr. C. G. Scott, as a deputation from the Repealers of Edinburgh, Leith, Glasgow, and Perth, with a contribution of 134*l.* Mr. Gordon gave notice of a motion:—"That preparation be made by the Association for submitting with all due despatch a proposition to the House of Commons, for the restoration of the constitution of Ireland, by the repeal or modification of the Act of Union; and that the counties, cities, and boroughs favourable to that object be respectfully requested to instruct their representatives in the House of Commons, when the proposition shall be brought forward." Mr. S. O'Brien objected to its being received. The committee he said knew how useless it would be to appeal to the House of Commons on the subject of repeal of the Union, and therefore objected to the reception of this notice, which was handed back to Mr. Gordon, who said that he did not mean to persist in acting on it, if at the expiration of a week he found the sense of the Association against it. Mr. W. J. O'Connell, who holds the office of head inspector of Repeal wardens for England, handed in the sum of 75*l.* 16*s.* 1*d.*, being the subscription for the past week of the various Repeal wards of London. Mr. O'Connell read a list of the wards, at the head of which were the O'Brien ward, the O'Connell ward, the Washington ward, &c. He had been appointed to the high office which he held by the Association; but the Liberator was a guarantee for his good conduct. Although the humblest member of the O'Connell family, he had stood to their illustrious head through life, and if his enemies attempted to touch him, he would stand to him to the death, for he should never be injured but through his breast. He was happy to be able to show the Association, by the sum of money which he had handed in, and which should be repeated weekly, that their expatriated Irish friends had formed a phalanx in the very camp of the enemy, at which tyranny trembled. Mr. D. O'Connell, jun., said, that he had news from the prison. He had to announce that all the traversers were in excellent health, and that his father especially was never more lively and animated, the imprisonment agreeing perfectly with his constitution. The rent for the week was 3178*l.* The collection of Repeal rent since Mr. O'Connell's imprisonment has been as follows:—First week, 2600*l.*; second week, 3100*l.*; third week, 3389*l.*; fourth week, ending on Monday last, 3178*l.* This makes a sum of above 12,000*l.* in four weeks, and it is said that efforts will be made to keep up the rent to the scale of 3000*l.* a week.—The Cork papers state that Mr. O'Driscoll has been reinstated in the commission of the peace, in compliance with a memorial to the Lord-Lieutenant. Mr. O'Driscoll had been removed by the Lord Chancellor in consequence of his conviction for an aggravated assault, and his demeanour in court after sentence. It is said that the Lord Chancellor has ordered a *supersedeas* to be prepared dispensing with the services of Mr. M. J. O'Connell, M.P. for Kerry, and a magistrate for that county. The Lord Chancellor has also superseded Mr. D. S. Lawlor, late High Sheriff of Kerry, and Mr. Thos. Dennehy, for the part they have recently taken in the proceedings of the Repeal Association.

Miscellaneous.

Animal Magnetism.—On Monday, a young man, known as Alexis the somnambulist, and who has just arrived from Paris under the care of M. Marcillet, was exhibited at the residence of Dr. Elliotson in Conduit-street. Alexis, who is a young man of about 20, having seated himself in a large arm-chair, M. Marcillet, the mesmerist, took his place before him, and looked intently upon him for a few minutes, without making any of the usual magnetic passes. Alexis drew breath heavily, his features became convulsed, and he was pronounced to be in the magnetic state. M. Marcillet then made the usual passes, and brought the arm, and then the legs, of Alexis into the state of cataleptic rigidity. His arm became stiff as iron, and his feet drawn up from the ground, on which they had previously rested. His legs became quite straight; and a gentleman present stood upon them without causing Alexis to flinch, or, to all appearance, suffer the slighest inconvenience. These experiments having been concluded, and the limbs restored to their natural state by a whiff of breath from the mouth of M. Marcillet, Alexis was brought into the state of clairvoyance, that state in which it is alleged the patient can see without eyes, not only what is passing around him, but what is doing in any part of the world to which his attention is directed; describe accurately houses, streets, cities, and counties that he has not visited; read the history of the past life of any who choose to inquire of him, and prophecy what is hereafter to befal them. A piece of cotton having been placed over each eye, a white cambric handkerchief was tied round his head over them, another handkerchief of the same kind was then tied diagonally over the right eye, and a third in a similar position over the left. The company were then invited to examine the bandages and convince themselves that they were properly secured, and that the patient could not see, which having been done, operations commenced. A pack of cards having been brought to Alexis, who, it should be

observed, *was all this time making violent movements with the muscles of his face*, as if he were suffering pain, M. Marcillet announced that he would select all the aces from the pack. It was suggested by a gentleman present that the cards should be shuffled, but this was not done, and Alexis picked out all the aces with the greatest ease. It was then announced that he would play a game of *écarte* with any person present. A gentleman stepped forward, and Alexis played with him and won. Another game was played, and another, Alexis always selecting his cards appropriately, and, whether winning or losing, playing properly. Another gentleman was invited to try a game, and Mr. Jerdan, who wore spectacles, sat down to the table, Alexis remarking, as he took his seat, "*Nous avons chacun la double vue.*" Two or three games were played with this gentleman with the same perfection as before. The next experiment was to read a book. A large folio volume was brought and placed before him—a page was opened—a handkerchief spread over it—and Alexis, whose eyes were still bandaged, *with much difficulty and hesitation, and as if painfully discovering syllable by syllable*, read two lines correctly. The volume was then placed *behind* his chair, and M. Marcillet, informing the company that the patient could read it in that position, the book was again opened. Alexis said he could see something, but not clearly. "Try again," said M. Marcillet, "courage, and exert yourself." Alexis tried again, and said he could see something like an engraving. "Bravo," said M. Marcillet, "you are right—go on." Alexis paused awhile, grasped the hand behind the chair, of the gentleman who was holding the book, and said he could see something long like columns. "Well done," said M. Marcillet, "go on." Alexis then could see something white. "Right," said the operator, "he sees the windows," and thus, gradually, with a word of encouragement when right, and of dissent and disapproval, and a new magnetic pass over him when he was wrong, Alexis got so far, in about a quarter of an hour or 20 minutes, as to say he saw a door. It having been remarked that the heat of the room was very great, Alexis tore the bandages off his eyes, apparently to cool himself, and turned half round towards the book behind his chair, and the back of the engraving being presented to him he looked at it very attentively. The paper was very thick, and an ordinary observer could not have detected any traces through it of the impression on the other side. Ultimately, however, his eyes being still unbandaged, he pronounced the engraving to be the view of a chapel. The book was then exhibited to the company, and the view was that of a cathedral—we believe that of Nôtre Dame at Paris. Another page was afterwards opened, also a coloured engraving, which Alexis, after a like process, pronounced to be another ecclesiastical edifice. On being exhibited to the company, it was found to be a drawing of an antique cheffonier, with two vases upon it. Colonel Gurwood, who was among the company present, and who it appears had been previously in communication with Alexis in Paris, then took a letter from his pocket, which he folded once or twice or more, and after a long examination of the outside, Alexis said it was written by an officer in the army, whose name began with a B. The next letter of his name he said was A. This being denied he said it was O; the next N, the next F, the next E. This being denied, he said it was F, the next L, and the whole name was Bonfill. Colonel Gurwood then unfolded the letter, and the signature was found to be Bonfille. Alexis then described the writer to be an Officer residing somewhere in the South of France, Bayonne he thought, with a bald head and a scar over his eye, and that he was at that moment engaged in writing. Colonel Gurwood said he had never seen his correspondent, and could therefore not state whether the description of his person was accurate or not, but that he was an officer in the army. Dissatisfaction having been expressed by several persons at the result of these experiments, and of the promptings which had been found requisite by M. Marcillet when his pupil had not made a correct description, it was proposed by one gentleman that he should be allowed to write a word upon a piece of paper, hold it in his hand, the writing concealed from the view of all around, behind the head or chair of Alexis, and that if Alexis could read it the experiment would be considered conclusive proof of the powers claimed. This was promised. In the meantime, however, many persons had congregated round Alexis, and put various questions to him as to the time by watches, some of which were right, and some put purposely wrong, to test him; and when the paper alluded to with one word upon it was produced, Alexis was said to be too much fatigued to try it, and it was not tried. After his refusal, some other persons who had expressed great faith in the reality of the phenomena were allowed to put questions to Alexis, who still, it was alleged, remained in the clairvoyant state. Upon this, the same gentleman who had expressed incredulity, pointed out that if these questions and experiments did not fatigue Alexis, the trial of the piece of paper, so simple and so conclusive, would not fatigue him, and again requested that an opportunity might be given to see whether Alexis could read it. The request was again denied upon the same ground as before. We have now narrated the principal occurrences of the sitting as fairly and simply as we could, leaving every reader to draw his own inferences. We have been promised another opportunity of witnessing the powers of the young man, and shall certainly attend; and in the meantime, having seen much on the part both of Alexis and M. Marcillet that does not satisfy us, we state, without reserve, that we have seen Herr Dobler, with less pretence, perform feats infinitely more extraordinary than anything we saw done by Alexis.—*Morning Chronicle.*

The Power of Youth.—The following passage, on the power of youth to achieve great things, is from a new novel by Mr. B. D'Israeli, entitled "Coningsby, or the New Generation":—"'I perceive,' said Coningsby, 'that you have great confidence in the influence of individual character. I have also some confused persuasions of that kind. But it is not the spirit of the age.' 'The age does not believe in great men, because it does not possess any,' replied the stranger. 'The spirit of the age is the very thing that a great man changes.' 'But does he not rather avail himself of it?' inquired Coningsby. '*Parvenus* do,' rejoined his companion; but not prophets, great legislators, great conquerors. They destroy, and they create.' 'But are these times for great legislators and great conquerors?' urged Coningsby. 'When were they more wanted?' asked the stranger. 'From the throne to the hovel all call for a guide. You give monarchs constitutions to teach them sovereignty, and nations sunday-schools to inspire them with faith.' 'But what is an individual,' exclaimed Coningsby, 'against a vast public opinion?' 'Divine,' said the stranger. 'God made man in his own image; but the public is made by newspapers, Members of Parliament, Excise-officers, Poor-law guardians. Would Philip have succeeded, if Epaminondas had not been slain? And if Philip had not succeeded? Would Prussia have existed had Frederick not been born? And if Frederick had not been born? What would have been the fate of the Stuarts if Prince Henry had not died, and Charles I., as was intended, had been Archbishop of Canterbury?' 'But when men are young, they want experience,' said Coningsby; 'and when they have gained experience, they want energy.' 'Great men never want experience,' said the stranger. 'But everybody says that experience—' 'Is the best thing in the world—a treasure for you, for me, for millions. But for a creative mind, less than nothing. Almost everything that is great has been done by youth.' 'It is at least a creed flattering to our years,' said Coningsby with a smile. 'Nay,' said the stranger; 'for life in general there is but one decree. Youth is a blunder; manhood a struggle; old age a regret. Do not suppose,' he added smiling, 'that I hold that youth is genius; all that I say is, that genius, when young, is divine. Why, the greatest Captains of ancient and modern times both conquered Italy at five-and-twenty! Youth, extreme youth, overthrew the Persian Empire. Don John of Austria won Lepanto at twenty-five—the greatest battle of modern time; had it not been for the jealousy of Philip, the next year he would have been Emperor of Mauritania. Gaston de Foix was only twenty-two when he stood a victor on the plain of Ravenna. Every-one remembers Condé, and Rocroy at the same age. Gustavus Adolphus died at thirty-eight. Look at his captains: that wonderful Duke of Weimar, only thirty-six when he died. Banier himself, after all his miracles, died at forty-five. Cortes was little more than thirty when he gazed upon the golden cupolas of Mexico. When Maurice of Saxony died at thirty-two, all Europe acknowledged the loss of the greatest captain and the profoundest statesman of the age. Then there is Nelson, Clive—but these are warriors, and perhaps you may think there are greater things than war. I do not; I worship the Lord of Hosts. But take the most illustrious achievements of civil prudence. Innocent III., the greatest of the Popes, was the despot of Christendom at thirty-seven; John de Medici was a Cardinal at fifteen, and Guicciardini tells us baffled with his State craft Ferdinand of Arragon himself. He was Pope, as Leo X., at thirty-seven, Luther robbed even him of his richest province at thirty-five. Take Ignatius Loyola and John Wesley, they worked with young brains. Ignatius was only thirty when he made his pilgrimage, and wrote the "Spiritual Exercises." Pascal wrote a great work at sixteen, the greatest of Frenchmen, and died at thirty-seven! Ah! that fatal thirty-seven, which reminds me of Byron, greater even as a man than a writer. Was it experience that guided the pencil of Raphael when he painted the palaces of Rome? He died, too, at thirty-seven. Richelieu was Secretary of State at thirty-one. Well, then, there are Bolingbroke and Pitt, both Ministers before other men leave off cricket. Grotius was in great practice at seventeen, and Attorney-General at twenty-four. And Acquaviva—Acquaviva was General of the Jesuits, ruled every Cabinet in Europe, and colonised America before he was thirty-seven. What a career!' exclaimed the stranger, rising from his chair, and walking up and down the room, 'the secret sway of Europe! That was indeed a position! But it is needless to multiply instances. The history of heroes is the history of youth."

Law.

HOUSE OF LORDS.—THE SUSSEX PEERAGE.—A Committee for Privileges assembled on Tuesday to resume the consideration of this claim. The Earl of Shaftesbury was in the chair. Few of the judges attended, but all the law lords were present. The attendance of the other lords was but scanty. Madlle. D'Este and Lady Virginia Murray (sister of Lady Augusta Murray), Admiral Sir R. Stopford, and Dr. Lushington, were examined; but the most important witness was Dr. Wiseman, the Roman Catholic bishop, who explained the Roman law of marriage at great length, and showed that the marriage between two Protestants at Rome, by a Protestant clergyman, according to the Protestant ritual, would be considered a valid marriage; and that the decree of the Council of Trent is held not to bind Protestants. At the close of Dr. Wiseman's evidence the Lord Chancellor intimated that the lords would expect the best evidence of the Roman law and the practice of the Roman tribunals, and the counsel for the claimant therefore suggested an adjournment, which accordingly took place.—The case was resumed yesterday, when copies of the Decree of the Council of Trent, and other works expounding the Roman law of marriage, were put in. The Vicar-Apostolic for Wales was examined, and a letter was put in from the Secretary of State to Lord Grenville, by which it was proposed to allow Lady Augusta Murray an annuity, provided she would not use the Royal Arms. A clerk from Coutts and Co.'s proved the payment of an annuity of 1800*l.* a year to Lady Augusta Murray. This closed the case for the claimant, and Mr. Erle summed up on his behalf. At the close of his address, the following question was submitted to the common-law Judges by the Lord Chancellor for their opinion:—Evidence being offered of a marriage solemnised at Rome, in the year 1793, by an English priest, according to the rites of the Church of England, between A B, a son of his Majesty King George the Third, and C D, a British subject, without the previous consent of his said Majesty, assuming such evidence to have been sufficient to establish a valid marriage between A B and C D, independently of the provisions of the statute of the 12th George III., chap. 11, would it be sufficient, having regard to that statute, to establish a valid marriage in a suit in which the elder son of A B claims an estate in England as son of A B by virtue of such marriage?"—The Committee was then adjourned *sine die.*

COURT OF QUEEN'S BENCH.—*Trial at Bar.—The Baron de Bode* v. *the Queen.*—This case, which has been so frequently before the public, came on on Thursday, the 20th, for what was, in fact, a re hearing of the evidence given under the inquisition in 1842. The inquiry was then made under a commission issued by the Vice Chancellor of England, upon a petition of right, and the commissioners and jury upon that occasion made a return, which consisted of a sort of special verdict in favour of the Baron de Bode, and in which they declared that he had been deprived of property which, with the interest, was now above the value of 300,000*l.* This return, upon coming into the Court of Equity, was traversed by the Crown. Upon that traverse issue was joined, and this new issue, which, in fact, was only the former one in a slightly different form, now came on to be tried. Mr. M. D. Hill, Mr. Sergeant Manning, Mr. Young, Mr. Mellor, and Mr. Anstey, appeared for the plaintiff; and the Solicitor-General, Mr. Erle, and Mr. Waddington, for the Crown. The trial lasted for four days, before a special jury, and after numerous witnesses, foreign as well as English, had been examined, Lord Denman summed up, giving a summary of the case as he proceeded. He said that it became the duty of the court to state the particular facts of this case, and to direct the jurors as to the best mode of discharging their duty with reference to this unaccustomed mode of proceeding. The case depended on a vast number of facts, spreading over a series of years, and involving various matters of law. There had been repeated inquiries and discussions with respect to it in courts and in Parliament, and it now came before the jurors in a proceeding which was very rarely adopted in courts of justice, and under circumstances of a particular nature. Two years ago the Baron de Bode had preferred a petition to the Crown, after all the other numerous inquiries had taken place. That petition was now before the jurors, and was called a petition of right. In that petition the baron assumed that a large sum of money belonging to him was now in the hands of the Queen, under circumstances which rendered the Crown liable to restore it to him. On the receipt of this petition, the Crown ordered right to be done according to law, and the Lord Chancellor thereon directed a writ to certain commissioners to hold an inquiry into the truth of the facts, as alleged in the petition. The general facts it would not be necessary to repeat, but there were particular facts on which the jurors must give their opinion: those were the facts put in issue by the record. The facts found on the face of the inquisition were, by the Attorney-General, denied altogether: he first traversed the facts, and next he insisted that even if the facts stated were true, still that in matter of law they did not establish the claim now put forward by the baron. The first great question arose on the treaty with France of 1814-1815, which gave certain rights to particular individuals, to be enjoyed under certain conditions to be previously performed by them. The baron insisted that under these treaties he was entitled, on the grounds that he was a British subject, that he had been born in England, of an English woman, in the county of Stafford; and he affirmed that his birth in England gave him the character of a British subject, and he insisted on the rights flowing from these facts, as giving him an absolute title to this fund. Such being the facts of the case, it was to be observed in the first instance, that there seemed to be no doubt of the petitioner's birth in this country. Indeed the Solicitor-General admitted him to be a British subject to a certain extent, although he accompanied the admission by observations upon the peculiar nature of the case. It was further to be taken as undoubted that the father of the claimant possessed a feud in Alsace, and it was contended that although that country was territorially united to France, the transmission of fiefs continued to be regulated by the law which had existed in that province before the treaty of Westphalia. Upon this subject of foreign law it would be the province of the jury to decide. In any question upon the law of England it would be the duty of the judges to state that law to the jury, and that of the jury to accept the law which had been so stated by the Court. Here however the foreign law was presented as a question of fact, and it was the business of the jury to award their decision upon the result of the evidence which had been given to them upon this as upon every other part of the case. The Solicitor-General had observed that the treaty of Westphalia may give the House of Austria a right of war against the crown of France for abolishing the feudal law in the territory of Alsace, but that such right of war could not at all derogate from the supreme sovereignty of France within her own dominions. It would be, however, for the jury to decide upon the evidence of the foreign lawyers, how far the observation of the Solicitor-General, though correct in the main, was qualified by the circumstances of the present case. It was not denied that the Baron de Bode, as one of the ancient nobility of Germany, held the lordship of Soultz, as a pure male feud, under the Archbishop of Cologne, and that he was regularly invested in that fief, along with his son, upon the failure of the house of Rohan Soubise. Such was the state of affairs in 1789, when the National Assembly abolished feudal rights, by the decree which had been so often adverted to. It was not, however, a matter of necessity that the decree should have had the effect of abolishing the mode of inheritance and succession which had previously existed, as there were many feudal customs and privileges which were contrary to natural right and justice, and which may be destroyed without at all affecting the manner of succeeding to estates. The preceding observations were intended to apply to the event of the jury being of opinion that the estate of Soultz sous Forêt was feudal at the time of the "cession" by the father to the son; but if they thought that the estate had become allodial by the effect of the decree of the National Assembly of 1789, then the occurrence in question would have to be treated upon a different footing. With regard to the fact itself, it had been fully detailed by the aged witness, Matthew Hummell, and the question was, what effect the Jury would give to his evidence of the fact combined with the testimony of the foreign lawyers as to the legal consequences which resulted from such an operation. His Lordship then read the evidence of Hummell, and that of the gentlemen who had been examined as to the effect of the cession according to the law which existed in Alsace at the time. With regard to the fact, it did not seem to have been disputed by the Crown; and as no legal opinion had been given contrary to that which had been adduced on the part of the claimant, the Jury would probably not withhold their assent

from the law of Alsace, as those gentlemen had laid it down. It would however be necessary for the Jury to decide whether the cession was a real, actual, and *bonâ fide* transaction, as the sincerity and integrity of it was necessary to make it valid in any view; for if it only occurred in form and in name, and was not intended to bind the rights of the parties, it never could in any court be treated as really having that effect. Whereas if the cession was perfect by the intention of the parties and the operation of law, the son became by that act the owner of the property which had been confiscated by the revolutionary government, and for which he now sought compensation. His lordship then referred to the treaty under which compensation was provided for property unduly confiscated, and said if the crown lawyers had intended to rely upon the legality of the decree of confiscation, they ought to have pleaded it specially, and shown what were the acts which rendered emigration criminal, and which brought the case of the claimant therefore within the operation of the decree. As this had not been done it seemed to the Court that the Baron de Bode was not bound to controvert that matter, as it had not been placed upon the record as a subject upon which reliance was to be placed. His Lordship then proceeded to the treaty of commerce of 1786, which he stated to be, in the opinion of the Court, inapplicable to the case. With regard to the point of the plaintiff's having presented his claim within due time it appeared to have been conceded. As to the fact of the name not being upon the register the same observation applied; and the question of value appeared not to have given rise to any discussion at all. Upon the whole case the first question for the jury to decide was whether the property in question by the joint effect of the investiture and cession became vested in the present Baron de Bode in 1791. The second was whether the property had been the subject of undue confiscation in the manner which had been stated. About the value of the property there seemed to be no doubt; and the questions which he had already stated were the only ones to which the jury had occasion to direct their attention. The Solicitor-General here interposed, and said that it was alleged, on the part of the petitioner, that in 1818, pending the discussions between the Governments of England and France upon the subject, the fund was augmented for the express purpose of providing for the claim of the petitioner. Lord Denman then left that question to the jury, stating that the averment upon the subject was in the petition, and not in the inquisition, and that he supposed that the present inquiry ought strictly to be confined to such allegations as were contained in both. There certainly was no specific evidence in the case that any sum had been set apart for that express purpose, but the probable intention of the assertion was only that the petitioners had a general right to participate in the fund which had been allocated for all the claimants. The issues which arose upon the pleas that the causes of petition had not accrued within six years, or within Her Majesty's reign, must be found for the Crown.—The Jury then retired, and after an absence of about an hour, they found specially that the "cession" so frequently referred to had taken place, and that it was valid for the purpose of effecting its object, which was that of transferring the estate of Soultz from the late Baron to the present claimant. The two issues upon the limitations they found for the Crown, and found also that no evidence had been given that any sum had been "expressly" set apart for the payment of the claim.—Mr. Hill then moved that the last finding be not entered upon the record, as it was not in issue.—The Solicitor-General opposed the motion.—Lord Denman referred to the paper containing a written statement of the matters upon which it had been agreed by the Court to take the opinion of the Jury, amongst which matters the matter in question was not. All the matters contained in that paper had been found. It was ultimately agreed that the verdict should be entered according to the notes of the Judge. There was no finding upon the question of value, but Mr. Waddington observed that the Crown would make no difficulty upon that head. The Jury were then discharged, after being thanked by Lord Denman for their patient attention.

COURT OF EXCHEQUER.—*Wood* v. *Leadbitter*.—This was an action for an assault, in forcibly expelling the plaintiff from the Grand Stand at the last Doncaster races. The defendant, amongst other things, pleaded that he was the servant of the Earl of Eglinton; that the close on which the plaintiff had entered, was the close of Lord Eglinton; that by command of his lordship, the defendant ordered the plaintiff to quit the close; and that upon the plaintiff's refusal, the defendant laid hands upon him and expelled him, using no more force than was necessary. To this plea, the plaintiff replied that he was in the close in question, at the time the assault was committed, by the licence of Lord Eglinton, upon which issue was joined. The case on behalf of the plaintiff was, that he had purchased at the regular office a ticket for the Grand Stand at Doncaster, for which he paid a guinea, and which was to have secured him admission to the Grand Stand during the races. That on the first day of the races, upon presentation of his ticket, he was admitted to the Grand Stand, but shortly after the defendant accosted him, told him he had positive orders to eject him, and upon the plaintiff's declining to go out the defendant seized him by the collar, and by the force of defendant and others assisting him, was hustled off the stand. The defence was that the stewards were resolved to exclude from the betting-ring all defaulters. The plaintiff was not only a defaulter, but a swindler and a cheat. He had been excluded from the Liverpool and Goodwood races, and Lord Eglinton, upon the suggestion of Lord G. Bentinck, had excluded him from Doncaster races. For the purpose of entrapping persons the plaintiff made bets upon commission. He obtained authority from a person named Hawker to make bets on his behalf. Hawker assented, and the plaintiff sent him several letters containing the particulars of bets made by him on Hawker's account, in reference to the race for the Derby stakes in 1841. The plaintiff informed Hawker that he had made bets for him with Colonel Anson, Mr. Greville, Mr. Payne, Capt. Rous, and other persons, which, in fact, he had never made. The horse against which the bets were made, unfortunately for the plaintiff, and contrary to his expectations, won. He was then obliged to confess to Mr. Hawker that he had deceived him, and that he could not pay him the amount which Mr. Hawker was entitled to receive if the bets had been genuine. Had the result of the race been different, Mr. Hawker would have had to pay plaintiff between 2000*l*. and 3000*l*, which plaintiff would have put in his pocket. When Hawker discovered the fraud practised on him, he appealed to the Jockey Club, and laid the whole case before them. They cited Wood to appear before them, but he declined to come. After this, it was thought Wood was an improper person to associate with honest men, and he was accordingly excluded from Liverpool, Goodwood, and Doncaster. After several witnesses had been examined, Baron Rolfe told the Jury that if they believed Lord Eglinton had given the plaintiff notice to quit the Grand Stand, and he had refused, and was afterwards removed without more force than was necessary, the defence was substantiated. As to the assault, no doubt it was committed, but it was immaterial, if the justification was proved. After considerable hesitation, the Jury returned a verdict for defendant, on the plea of justification.

POLICE.—*The Poisoning Case at Stepney.*—Several examinations have taken place during the last fortnight at the Thames Police Court, in reference to the mysterious death of Mrs. Rachel Belaney and the conduct of her husband. On Wednesday the magistrates remanded Mr. Belaney for further examination this day, intimating that if he received no further evidence he should then commit him for trial on the capital charge. On Thursday, the coroner, who has been holding a concurrent inquiry into the case, held an adjourned inquest, at which the evidence given at the Police-court on Wednesday, was repeated, and certain letters written by Mr. Belaney, were put in and read. The coroner, in summing up, dwelt with great force on the statements contained in the letters written by Mr. Belaney, the contents of which, he said, were undoubtedly false, and evidently intended to mislead the relatives and friends of the deceased in the north as to the cause of her death. He also remarked on the fact, that although deceased expired on the morning of Saturday, the 8th inst., and her husband knew she had swallowed the deadly poison, which he admitted he had left in a tumbler in her bedroom, he made no communication of the fact until after the *post mortem* examination, when it could be no longer concealed. The case was a most extraordinary and mysterious one, and demanded the most serious consideration of the jury. If they were of opinion that Mr. Belaney placed the tumbler containing the poison in the way of the deceased, with the clear and deliberate intention of taking away life, although he did not actually administer it, it it would be their duty to return a verdict of wilful murder, and send the case before another tribunal. The case put by the unfortunate gentleman himself was, that he had been guilty of "gross neglect" in leaving the prussic acid in the room, without giving his wife any intimation of what the tumbler contained, or cautioning her against meddling with it; and if the jury only took that view of the case, and were of opinion there was gross negligence on his part in leaving the poison in the room, but without any intention on his part to destroy life, it would amount to manslaughter, and the law was very clear on that point. If the jury were of opinion that the prussic acid was left in the room without any of that recklessness or incaution which Mr. Belaney's own language implied, they would consider whether it was a case of misadventure. If they were not satisfied on either of these points, they might, in a case involved in so much mystery, return an open verdict, that the deceased met with her death from taking prussic acid (for of that there was not the shadow of a doubt), but how or by what means it was administered there was no evidence before them, and such a verdict would not prevent any other proceedings against Mr. Belaney. The coroner then explained the law at some length, and remarked on the duplicity of which the prisoner had been guilty in writing to his clerk in the north, that his wife was dangerously ill, and attended by two medical gentlemen, the fact being that her death was quite sudden, and she had not received any medical advice whatever. The neglect of the prisoner in not having recourse to the usual remedies known to every medical practitioner when he discovered his wife had taken the poison, was also a circumstance of strong suspicion; and the letters he had written seemed to prepare the people in the north for that dreadful event which really happened. He particularly called the attention of the jury to a letter written on the day of Mrs. Belaney's death, which stated that she was dangerously ill. The prisoner had penned a wilful and deliberate falsehood in the letter of the 8th of June; and the one dated the 9th, which communicated the news of her death, made no mention of her having taken prussic acid, and he believed it would never have been known that she had met her death in this manner, if he had not ordered a *post mortem* examination of the body. The jury returned a unanimous verdict of wilful murder against James Cockburn Belaney; and the coroner then issued a warrant for his committal to Newgate, and bound over the witnesses, 16 in number, to give evidence at the next session.—It may here be mentioned that the mother of the deceased lady, from whom the prisoner expected to inherit some property, died about two years since in a sudden and mysterious manner, and that her body has been exhumed for medical examination. It is supposed to be in reference to this case that the police magistrate on Wednesday intimated that there would probably be a second case against the prisoner.

SPORTING.

THE DERBY.—A meeting of the Jockey Club was held on Saturday, and was attended by the Right Hon. G. S. Byng, and the Earl of Stradbroke, stewards; Hon. Colonel Anson, Earl of Chesterfield, C. C. Greville, Esq.; General Grosvenor, T. Houldsworth, Esq.; Colonel Peel, Earl of Rosslyn, J. V. Shelley, Esq.; W. S. Stanley, Esq.; and J. R. Udny, Esq. The meeting having assembled to consider the question of the age of the horse Leander, and having heard evidence, were fully satisfied that Leander was four years old when he ran for the Derby, and therefore resolved—1. That Messrs. Lichtwald, the owners of Leander, shall be for ever disqualified for entering or running any horse in their own name, or in the name of any other person, at any race where the rules and regulations of the Jockey Club are recognised. 2. That Mr. Ley, whose horse ran second for a Two yrs-old Stake at Ascot, in 1843, when Leander came in first, is entitled to those stakes. Several of the members who were present at the above meeting attended again on Monday, the 24th, when it was resolved that the evidence should be printed, and that no opinion should at present be expressed as to the trainer in this matter.

BIRTHS.—On the 19th inst., at Campden-hill, LADY CAROLINE LASCELLES, of a daughter—21st inst., at Edinburgh, the lady of W. FORBES, Esq., of Medwyn, of a daughter—21st inst., at Putney, the lady of the Rev. W. T. BUTLER, of a son—21st inst., at Church Cobham, the lady of Mr. ATKINS, of White Hart-court, Lombard-street, of a son—21st inst., at Chartley, the seat of Earl Ferrers, the lady of the Hon. H. H. TRACY, of a daughter.

MARRIED.—On the 13th of June, at St. James's Church, Cheltenham, M. PIPON, Esq., late Captain King's Dragoon Guards, to ANN RODNEY, eldest daughter of the late Hon. Captain Rodney, R.N., and niece to Lord Rodney—14th inst., at St. Michael's Church, Blackrock, the Rev. G. BURROWES, only son of the late Dean of Cork, to ELIZ. FREND, eldest daughter of G. C. Frend, Esq., of Rosetta, Blackrock—18th inst., at Brockley Church, Somersetshire, the Rev. W. WELLINGTON, Rector of Upton Helions, in the county of Devon, to FLORENCE PIGOTT, second daughter of J. H. S. Pigott, Esq., of Brockley Hall, in the county of Somerset.

DIED.—Recently, in London, LADY CATHERINE BERNARD, relict of the late Col. Bernard, of Castle Bernard, in the King's County, Ireland, aged 51—11th ult., at Jerusalem, the infant son of SIR C. BISSHOPP, Bart.—4th inst., at Portsmouth, on his return from the River Gambia, Capt. T. BERWICK, 3d West India Regiment—12th inst., at Maida-cottage, Elgin, North Britain, the Rev. P. BARCLAY, late minister of the parish of Sandsling, Shetland, aged 86—13th inst., at 31, Moray-place, Edinburgh, Dr. T. C. HOPE, late Professor of Chemistry in the University of Edinburgh—15th inst., at Ludlow, R. WAKEFIELD, Esq., surgeon, of that place, aged 57—15th inst., A. MORRIS, Esq., of Dunkettle, county of Cork—18th inst., at Aberdeen, Mr. J. ESDAILE, son of J. Esdaile, Esq., of Upper Bedford-place.

PIANOFORTES.

LUFF & CO., MANUFACTURERS, 103, Great Russell-street, Bloomsbury. The cheapest house in London for a first-rate warranted Pianoforte.—Free use of case, and exchange allowed.—LUFF AND CO., 103, Great Russell-street, Bloomsbury.

MIND COMPLAINTS or NERVOUSNESS.—Clergymen, Noblemen, and all who suffer from groundless fear, suspicion, inquietude, &c., confusion, blushing, despondency, indecision, irresolution, head-ache, vertigo, loss of memory, delusion, inaptitude for society, study, or business, blood to the head, restlessness, wretchedness, thoughts of self-injury, &c., can now not only be relieved, but tranquillised, made happy, and cured. The Rev. Dr. WILLIS MOSELEY, late of Cambridge University, after enduring these sufferings 14 years, discovered their causes, seat, and a perfect cure, and for 25 years has had no relapse. By the same means he has cured numerous clergymen, gentlemen, noblemen, &c., and of 10,000 applicants knows not 20 uncured who have followed his advice. Numerous testimonials can be seen and references given. Most get well in six weeks. Means of cure sent to all parts. Apply or write. At home from 11 to 3. 9, Charlotte-street, Bloomsbury.

PARR'S LIFE PILLS,

THE BEST MEDICINE IN THE WORLD, are now established as the only *certain* cure of disease in the human frame. Sufficient has already been advertised in the public prints to convince any reasonable person that the efficacy of this Medicine is unbounded, and that every disease will soon vanish from the effects of this popular remedy. Already the Proprietors have received and published 26 different sheets of Testimonials; and, besides, have received some thousands of letters confirming all the statements published, and proving the immense benefit derived by all classes by taking PARR'S LIFE PILLS. Testimonials are received daily, and it would be impossible in a newspaper to publish one-half received; and the following are selected as people well known in their respective neighbourhoods, and whose testimony is unquestionable. Further sheets of Testimonials may be had, gratis, of all Agents.

IMPORTANT TESTIMONY of an old man in his 77th year, received by Messrs. MOTTERSHEAD and Co., Manchester, and forwarded to the Proprietors of PARR'S LIFE PILLS.

I, THOMAS BARLOW, gratefully testify to the great benefit I have derived by taking PARR'S LIFE PILLS. I had been out of health for many years; sometimes unable to work, and on the sick club. I had a bad complaint at the stomach, with a violent cough, and at various times was under different medical men, including the noted Dr. Newbold of the Chorlton Dispensary; but my case seemed hopeless, as they none of them could cure, or give me much relief, and I had no hopes left of being better on this side the grave; however, quite unexpected, the deliverer came at last (Old Parr's Recipe). I got a box of his Pills, and found immediate benefit from the first box, and continued them for several months with increased good until this time, and now I feel myself wonderfully well, and am strong in body, have a good appetite, and though in my 77th year, I am able to get my own living, in the employ of Mr. Mee, farmer, Withington (as a farm labourer). I am satisfied that my recovery is to be ascribed entirely to the restorative qualities of PARR'S LIFE PILLS; and as a proof of my great age, subjoined is a copy of my baptismal register.

BAPTISM, 1767.—THOMAS, son of JAMES and MARTHA BARLOW, of Hale, Cheshire, was Baptised the 27th day of November, in the year of our Lord 1767.

From the Parish Register—F. BOWDON.
Signed—JOHN BALDWIN, Vicar.

CAUTION TO THE PUBLIC.

*** Beware of Spurious Imitations of the above Medicine. None are genuine unless the words "PARR'S LIFE PILLS," are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the facsimile of the signature of the Proprietors, "T. ROBERTS and Co., Crane Court, Fleet-street, London," on the directions. Sold in boxes, at 1*s*. 1½*d*., 2*s*. 9*d*., and family packets, 11*s*. each.

TO PREVENT IS BETTER THAN TO CURE.—With a view of Fencing off cold air from the Lungs, delicate persons are recommended to adopt the FACE PROTECTOR, which not being a fixture, but carried as a fan, can be applied to the Face as circumstances require. Being a double lace, projecting by means of wires, you do not breathe your own breath, but breathe the outward air subdued Its elegance, it is hoped, will be an additional recommendation. Ladies are likewise invited to inspect the CAGE PROTECTOR, which is a slight frame of wood or leather, with needles attached, so that when a Cage is put on the Table, no Cats dare approach. Sold by Mrs. ROBSON, private door 68, New Bond-street, first floor, over Mr. ROBSON'S shop for the Riding Boot, or Patent Spring Overall.

WANTED, a GARDENER.—J. WEEKS, jun. & Co. Hothouse Builders and Hot-water Apparatus Manufacturers, Gloucester-place, Chelsea, would be happy to meet with a Gardener who is competent to draw good Architectural and Prospective Plans of Horticultural Buildings, to act as CLERK in their office.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, or GARDENER and BAILIFF.—A sober, active, married man, without incumbrance, aged 40, who has a thorough knowledge of Forcing all kinds of Fruit, Flowers, and Vegetables, with the entire management of the Kitchen and Flower-Garden, having had great experience from his youth up to the present time. The best testimonials for character and ability can be obtained from the family he has just left, who are now in London.—Direct to A. B., care of Mr. Lockwood, Stationer, 75, New Bond-street, London.

AS GARDENER.—A married Man, who has a thorough knowledge of Kitchen and Flower-Gardens, also of Forcing Cucumbers, Grapes, and other Fruits. No objection to Land. Can have two years' character from the gentleman he has just left.—Direct to J. K., Mr. Rollisson's Nursery, Tooting.

AS GARDENER.—A single Man, aged 30, who thoroughly understands his business in all its branches. Can have a good character from his last situation.—Direct to A. B., 8, Swan-street, Dover-road, Borough.

AS GARDENER.—A respectable young Man, who understands his business. No objection to Meadow-land or Cow. Has five years' good character from his last situation.—Direct to A. B., Mr. Brock, Cabinet-maker, Camberwell-green.

AS GARDENER.—A married man, without incumbrance, aged 35, who understands Forcing Flowers and Kitchen Gardening. Can be highly recommended from the gentleman he has left.—Direct to J. H., Mr. ROLLISSON, Nursery, Tooting, Surrey.

AS GARDENER.—WM. M'DONALD, late Gardener to her Grace the Dowager Duchess of Cleveland, Newton House, Bedale, Yorkshire, is now at liberty to engage with any Nobleman or Gentleman requiring the services of a thorough Practical Gardener in every sense of the word. He is a single and middle-aged man. Direct to him at Mr. DAVID GODFREY'S, High-street, Peckham, where communications will meet the best attention.

AS GARDENER.—A Married Man, without family, who is accustomed to the care of extensive Pleasure-Grounds, Kitchen Garden, Greenhouse, Vinery, &c. &c. His wife could take the situation of Housekeeper or Cook, with 3 years' character. Direct to WM. CLARK, Seedsman, 25, Bishopsgate Within.

TO AGRICULTURISTS.

A YOUNG MAN, 25 years of age, is desirous of obtaining a Situation where his services might be available. The Advertiser has a practical knowledge of Accounts, and the usual routine management of Suffolk Farming, and would devote his undivided attention to the interest of his employer, by assisting to superintend. Salary not so material an object as a comfortable home, with good opportunities of improvement. Unexceptionable references as to respectability and competency can be given.—Direct to Mr. Loder, Bookseller, Woodbridge, Suffolk.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 27.—1844. SATURDAY, JULY 6. [PRICE 6*d*.

CARNATIONS AND PICOTEES.—Grand Exhibition now in full bloom, at Messrs. N. & B. NORMAN'S, Bull Fields, Woolwich. July 6, 1844.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL AND CO. are now sending to any part of the United Kingdom, the undermentioned highly-desirable Plants, full particulars of which will be found in their former Advertisements.

FUCHSIAS—per post free.

12 Extra Fine varieties, 12*s*., the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser, comprising most of the new varieties sent out this season.
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser

VERBENAS—per post free.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto ,, 10*s*., the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s*. per dozen
12 Extra Fine ditto, do. . . 18*s*. ,,

CHRYSANTHEMUMS. (Sent postage free.)

Fifty of the newest best varieties by name, 12*s*. per dozen ,for list and colours of which, see Advertisement of June 15th.

PETUNIAS—per post free.

Extra Fine Varieties, 12*s*. per doz., including Miller's Punctata.

PANSY "LADY ALICE PEEL" (for particulars of which see Advertisement of June 1, 1844, 3*s*. 6*d*. per plant.

ARAUCARIA IMBRICATA, 4 years old, 30*s*. per dozen, or 10*l*. per 100.

CEDRUS DEODARA, 2 ft. to 2 ft. 8 in., 10*s*. 6*d*. per plant.

CAMELLIAS.—Extra fine sorts, including Monarch, Tricolor, Elegans, Beallii, Lefeveriana, King, Chandlerii, &c., 42*s*. per dozen.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

Great Yarmouth Nursery, July 4, 1844.

JOHN STANDISH, NURSERYMAN, Bagshot, begs to inform his Friends and the Public that he is now sending out his SEEDLING FUCHSIAS, which he can strongly recommend, four of which, marked with an asterisk, are the largest yet sent out. See Paxton's "Magazine of Botany" for March.—Also now ready, his new SALVIA BICOLOR, which he has proved to be perfectly hardy, and one of the most beautiful showy herbaceous plants of the present day. Likewise a New Pink GERANIUM, for Bedding, which was raised from the Frogmore Scarlet, being exactly like that plant in habit, foliage, and shape of flower, only of a delicate pink colour with a white eye.

*Fuchsia Colossus	7*s*	6*d*	Fuchsia Conductor	5*s*	0*d*
* ,, President	7	6	* ,, Candidate	5	0
* ,, Attractor	7	6	,, Antagonist	5	0

Or the set of six plants, 31*s*. 6*d*.

SALVIA BICOLOR . . . 5*s*. 0*d*.
GERANIUM LUCIA ROSEA . . 3 6

N.B.—A remittance is expected from unknown correspondents.

CLOTH OF GOLD NOISETTE ROSE.

H. CURTIS begs to inform the Nobility and Gentry he has a few Plants remaining of the above highly-desirable double yellow Autumnal Blooming Rose, which would yield several good buds for inserting this summer. Plants, 10*s*. 6*d*., package and carriage to London included.—West of England Rose Nursery, Moorend, near Bristol.

IMPROVED PAPER FOR DRYING PLANTS.—The Subscriber begs to acquaint his Botanical Friends that he has received from the Manufacturers, (Messrs. W. & R. Bent) a supply of the above Paper: it can be had in any quantities. Specimen Sheets may be seen with Mr. M'Nab, at the Royal Botanic Gardens. Samples, with Prices, to be had on application to the Subscriber, R. S. M'Intosh, 12, Catherine-street, Edinburgh.

ROYAL BOTANIC SOCIETY OF LONDON. LIST of PREMIUMS awarded at the EXHIBITION of PLANTS and FLOWERS on TUESDAY, JULY 2d. The successful candidates are requested to signify to the Secretary, Mr. Sowerby, at the Gardens, within a fortnight, whether they wish to take the Prizes in Medals, Plate, or Money.

For Collections of 40 *Stove and Greenhouse Plants.*—1st Prize to Mr. W. Barnes, gr. to G. W. Norman, Esq., Bromley; 2d, to Mr. Hunt, gr. to Miss Traill, Hayes-place, Bromley.

For Collections of 20 *Stove and Greenhouse Plants.*—AMATEURS.—1st Prize to Mr. Bruce, gr. to Boyd Miller, Esq., Tooting; 2d, to Mr. Baker, gr. to — Lindsay, Esq., Croydon; 3d, to Mr. Green, gr. to Sir E. Antrobus, Bart., Cheam. NURSERYMEN.—1st Prize to Mr. Fraser, Lea-Bridge Road, Leyton; 2d, to Mr. Pawley, White Hart Hotel, Bromley.

For Collections of 10 *Stove and Greenhouse Plants.*—1st Prize to Mr. May, gr. to E. Goodhart, Esq., Beckenham; 2d, to Mr. Taylor, gr. to Jas. Costar, Esq., Streatham; 3d, to Mr. Slowe, gr. to W. R. Baker, Esq., Baylordbury Park.

For a Collection of 6 *Stove and Greenhouse Climbers.*—1st Prize to Mr. Fraser.

For Specimen Ornamental Plants.—1st Prize to Mr. May, for Erica jasminiflora alba; 2d, to Messrs. Lucombe, Pince, & Co., Exeter, for Statice macrophylla; 3d, to John J. Wells, Esq., Bromley, for Erica Hibbertiana. Extra Prize to Messrs. Lucombe & Co., for Cyrtoceras reflexa. Certificates to Messrs. Lucombe & Co., for Ixora acuminata, and to Mr. Bruce, Tooting, for Gloxinia Cartonii, on account of their novelty; and to Mr. Dobson, gr. to Mr. Beck, Slateworks, Isleworth, for Achimenes grandiflora, on account of superior cultivation.

For a Specimen Plant of tall-growing Cactus.—1st Prize to Mr. Bunney, Stratford, for Cereus monstrosus.

For Collections of Dwarf-growing Cacti.—1st Prize to Messrs. Lee, Hammersmith; 2d, to Mr. Bunney.

For a Collection of 4 *Achimenes.*—1st Prize to Mr. Dobson.

For a Collection of 4 *Clerodendrons.*—1st Prize to Mr. W. Barnes.

For Collections of 12 *Fuchsias.*—1st Prize to Mr. Gaines, Battersea; 2d, to James Simpson, Esq., Thames Bank, Pimlico. Extra Prize, to Mr. Halley, Blackheath; Extra do., to Mr. Laing, Twickenham.

For a Collection of 6 *Scarlet Pelargoniums.*—2d Prize to Mr. W. P. Ayres, gr. to James Cook, Esq., Brooklands, Blackheath.

For a Specimen Plant of Scarlet Pelargonium.—Certificate to Mr. W. P. Ayres, for General Tom Thumb.

For Collections of 12 *Pelargoniums in No.* 24 *Pots.*—AMATEURS.—1st Prize to Mr. Dobson. NURSERYMEN.—1st Prize to Mr. Gaines; 2d, to Mr. Catleugh, Hans-street, Chelsea.

For Collections of 12 *Pelargoniums in No.* 12 *Pots.*—NURSERYMEN.—1st Prize to Mr. Gaines; 2d, to Mr. Catleugh.

For Collections of 8 *Pelargoniums in No.* 24 *Pots.*—1st Prize to Mr. Staines, Middlesex-place, Lisson-grove; 2d, to Mr. Coysh, gr. to R. Hudson, Esq., Clapham.

For a Specimen Plant of Pelargonium.—Extra Prize to Mr. Gaines, for Floridum.

For Collections of 8 *Calceolarias.*—AMATEURS.—1st Prize to Mr. W. Barnes. NURSERYMEN.—1st Prize to Mr. Gaines.

For Seedling Pelargoniums.—2d Prize to Mr. Beck, Slateworks, Isleworth, for Aurora; 3d, to Mr. Silverlock, Chichester, for Emperor Nicholas. Certificate of Merit to Mr. Staines, for La Polka; Certificate of Merit to Messrs. Henderson, Pine-apple Place, Edgeware Road, for Lady Peel.

For a Seedling Pelargonium, containing a deep shade of Scarlet.—1st Prize to Mr. Beck, for Igniferum.

For a Seedling Scarlet Pelargonium.—Certificate to Mr. Diplock, gr. to M. Emmanuel, Esq., Hammersmith, for Antagonist.

For a Seedling Fuchsia.—1st Prize to Mr. Hally, for Highland Chief.

For Collections of Cut Blooms of Moss Roses.—AMATEURS.—1st Prize to Mr. Betteridge, Milton Hill, Abingdon; 2d, to Mr. Milne, gr. to C. S. Chauncey, Esq., Little Morden, Ware. NURSERYMEN.—1st Prize to Messrs. Lane and Son, Great Berkhampstead; 2d, to Mr. T. Rivers, jun., Sawbridgeworth; 3d, to Mr. Hooker, Brenchley.

For Collections of Cut Blooms of Summer Roses.—AMATEURS (50).—1st Prize to Mr. Milne; 2d, to Mr. A. Parsons, gr. to A. K. George, Esq., Ponder's End, Enfield; 3d, to Mr. Henry Collison, Bath. Extra Prize, to Mr. Betteridge; Extra do., to Mr. Slowe. NURSERYMEN (100).—1st Prize to Messrs. Lane and Son; 2d, to Mr. T. Rivers, jun.; 3d Prizes (equal) to Messrs. Paul and Son, Cheshunt; and to Mr. Hooker.

For Collections of 24 *Cut Verbenas.*—1st Prize to Mr. Smith, Hornsey Road. Extra Prize to Mr. W. P. Ayres.

For Collections of 24 *Carnations.*—1st Prize to Messrs. Norman, Bull-fields, Woolwich; 2d, to Mr. Willmer, King's-road, Chelsea.

For Collections of 24 *Picotees.*—1st Prize to Mr. John Dickson, Brixton; 2d, to Mr. Edmonds, Wandsworth-road. Extra Prize to Messrs. Norman.

For Collections of 24 *Pinks.*—1st Prize to Messrs. Brown and Atwell, Uxbridge; 2d, to Mr. Hardstone, St. Mary Cray.

For Collections of 36 *Pansies.*—1st Prize to Mr. Parsons, Enfield; 2d, to Messrs. Goode, Ponder's-end, Enfield.

For Collections of Roses, in Pots, (20 plants).—1st Prize to Messrs. Lane and Son; (10 plants)—1st Prize to Mr. Dobson.

For a Seedling Heath.—1st Prize to Mr. Burley, Limpsfield, for Erica tricolor pallida.

For Collections of Cape Heaths.—(15 plants)—AMATEURS.—1st Prize to Mr. May; 2d, to Mr. W. Barnes. NURSERYMEN.—1st Prize to Mr. Jackson, Kingston-on-Thames; 2d, to Mr. Pawley; 3d, to Messrs. Fairbairn, Clapham. (6 plants)—AMATEURS.—1st Prize to Mr. Hunt; 2d, to Mr. Taylor, Streatham. NURSERYMEN.—1st Prize to Mr. Dawson, Brixton-hill; 2d, to Mr. Fraser.

For a Collection of 24 *Alpine Plants.*—2d Prize to Mr. Wood, Norwood.

For a Device in Cut Flowers, representing the grouping of colours.—1st Prize to Mr. W. P. Ayres.

For a Collection of 6 *Statices.*—1st Prize to Mr. Taylor.

For Collections of 6 *Orchidaceous Plants.*—1st Prize to Mr. Hunt; 2d, to F. G. Cox, Esq., Stockwell; 3d, to Mr. Barnes.

For a Specimen Orchidaceous Plant.—3d Prize to Mr. Jackson, for Brassia Wrayesæ.

For Collections of British Ferns, in Pots.—1st Prize to Mr. A. Smith, gr. to Joseph Anderson, Esq., The Holme, Regent's Park; 2d, to Mr. Taylor.

The following *Extra Prizes*, for miscellaneous subjects, were awarded:—

For a Collection of Dried Specimens of 37 *Varieties of Cultivated Grain*, to Mr. T. Moore, Camden Town. *For Mimulus Splendens*, to Mr. Bunney. *For a Collection of* 10 *Kinds of Fruit*, to Mr. T. Bursill, Brentford. *For a Collection of* 24 *Seedling Pelargoniums cut blooms*, to Messrs. Lucombe & Co. *For a Seedling Petunia, No.* 1, to Mr. Sorrell, Springfield. *For a Seedling Pink*, Favorite, to Messrs. Brown and Atwell, Uxbridge.

There were several fine microscopes exhibited by Messrs. Powell and Leland, Mr Ross, and Mr. Varley; but the first party only having duly entered their instruments, the 1st Prize was necessarily awarded to them. There were 41 unsuccessful competitors, who, for the trouble taken by them, the Society feels indebted, and takes this opportunity of returning them its thanks.

J. D. C. SOWERBY, Secretary.

NEW PLANTS.

R. GLENDINNING very respectfully begs to offer the following New and Valuable Ornamental Exotic Plants:—

CLERODENDRUM INFORTUNATUM.—This new and magnificent species, surpassing all others of the genus yet introduced, was awarded the Large Silver Medal at the Horticultural Society's Exhibition on the 15th inst.

PENTAS CARNEA.

LISIANTHUS GLAUCIFOLIUS.

Do. NIGRICANS.

ACHIMENES PICTA.—R. G. obtained the Knightian Medal on the 15th ult. for this very fine new species.

GLOXINIA.—Four new varieties, two of which have been awarded the Banksian Medal. A Figure of the Group will shortly appear in the "Botanical Register."

Chiswick Nursery, near London, July 6, 1844.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith.*

"I write to describe the wonderful efficacy of POTTER'S LIQUID GUANO; Peas, Onions, and Asparagus have been singularly improved by it. People came to admire the appearance of the garden."—See *Chronicle*, p. 406.

*** Beware of an inefficacious imitation. See *Chronicle*, p. 405—"Humphreys's Compound."

Sold by most Chemists and Seedsmen.

Factory, 28, Upper Fore-street, Lambeth.

CURTIS'S BUDDING KNIFE.—"This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved penknife, sharp, and turned up at the point, and is evidently extremely well contrived for the purpose it is intended."—Opinion of Professor LINDLEY, in the *Gardeners' Chronicle*, July 29, 1843.

GEORGE PLUM, Surgical Instrument Maker and Cutler, No. 262, Strand, London, and at No. 3, Dolphin-street, Bristol, begs to call the attention of the public to the above new and desirable article, manufactured solely by him. Sent free to any part of the kingdom, on receipt of 36 penny postage stamps, or a post-office order for 3*s*. 2*d*.

LYNDON'S PATENT SPADE.—Sold by GREEN and CONSTABLE, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

HORTICULTURAL BUILDING & HEATING by HOT WATER

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, June 28, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones .	. p. ton	£4	10*s.*	0*d*	Nitrate of Potash	„	£1 4*s.* 6*d*

Nitrate of Soda,	p. cwt.	0	14	9			

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained at half the usual cost, by dissolving Half a Bottle of this powder in a *quart of water*, and using a table-spoonful to a gallon in watering flower-beds. *Sold in bottles*, 1*s.* 9*d. each*, by Chemists and Seedsmen. Agents, DAVY, MACKMURDO and Co., 100, Upper Thames-street, London.

*** "In these days of *deception*, it is due to those persons who send out a really good article, that those who benefit by it should make it known."—See Evidence of J. R. PEARSON, Chilwell Nurseries, *Chronicle*, p. 390, "*Humphreys's Compound.*"

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London

---

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3-inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Milbank-street, Westminster.

AGRICULTURAL SCHOOL.

MESSRS. NESBIT'S ACADEMY, 38, Kennington-lane, Lambeth, near London.

"From Chemistry alone further progress in Agriculture is to be expected."—LIEBIG.

In this School, in addition to the general routine studies, every facility is afforded for the acquisition of a sound knowledge of Chemistry. The Pupils are practically taught in the Laboratories the methods of analysing the various earths, soils, manures, &c.; and likewise the means of detecting the substances abstracted from the land by different crops. Land Surveying is also taught practically, as well as theoretically.

A copy of a Lecture on Agricultural Chemistry, delivered by Mr. J. C. NESBIT to the Maidstone Farmers' Club, and the Terms of the School, which vary from 40 gs. to 70 gs. per annum, may be had on application, either personally or by letter.

Mr. NESBIT'S Works on Land Surveying, Mensuration, Gauging, Arithmetic, English Parsing, Education, &c., may be had of all Booksellers.

REFERENCES.—Dr. D. B. Reid, F.R.S.E., &c., Author of "Elements of Practical Chemistry," &c., St. James's Park, Westminster; G. F. Richardson, Esq., F.G.S., Author "Geology for Beginners," &c., British Museum, London; W. and J. Gibbs, Esqrs., Civil Engineers, Devonshire-street, Portland-place, London; Rev. T. Cuffe, Carlisle Episcopal Chapel, Lambeth; R. Greenhill, Esq., Ashford, Kent; C. G. Whitaker, Esq., Barming, near Maidstone, Kent.

The School will be re-opened on Monday, July 15th, 1844

THE AGRICULTURAL MEETING, AND GENERAL SHOW OF LIVE STOCK, under the Patronage of The Highland and Agricultural Society of Scotland, takes place at Glasgow on the 7th, 8th, and 9th of August next. The arrangements will be—

Wednesday, Aug. 7.—The Exhibition of Agricultural Implements, Dairy Produce, Roots, Seeds, and Plants.

Thursday, Aug. 8.—The General Show of Cattle, Horses, Sheep, Swine, and the whole of the articles enumerated above, exhibited on Wednesday.

Friday, Aug. 9th.—The Exhibition of the Prize Stock, Implements, and other articles.

The Premiums to be awarded amount to 1600*l.* The Classes will be—

CATTLE.—1. Short-horned; 2. Ayrshire; 3. West Highland; 4. Galloway, Angus, and Aberdeen, Polled; 5. Fife; 6. Any Breed. HORSES.—1. Cart Stallions; 2. Do. Mares; 3. Brood Mares; 4. Colts; 5. Fillies; 6. Geldings, &c. SHEEP.—1. Black-faced; 2. Cheviot; 3. Leicester; 4. Southdown; 5. Crosses.

ALPACAS; SWINE; POULTRY.

DAIRY PRODUCE.—1. Curing Butter; 2. Making Cheese.

SEED WHEAT.—To be competed for on 2d October.

EXTRA STOCK, ROOTS, SEEDS, IMPLEMENTS, and MACHINES.

The competition is open to Stock and Implements from every part of the United Kingdom. The Certificates for Stock, Implements, &c., must be lodged with the Secretary of the Society, or transmitted so as to reach him, at his office, Albyn-place, Edinburgh, or with the Local Secretaries at Glasgow, at the latest on Tuesday, the 16th July. Copies of the Bill of Premiums and Regulations, and Certificates to be completed, may be had on application at The Society's Hall, Albyn-place, Edinburgh; of Mungo Campbell, Jun., Esq., Glasgow; and of Mark Sprot, Esq., of Garnkirk, the Local Secretaries. The Secretary of any Local Association will, on application, obtain Copies of the Bill of Premiums for the use of the Members of the Association.

CHAS. GORDON, Secretary.

Society's Hall, Edinburgh, June 15th, 1844.

The GREAT DINNER, on the day of the General Show Thursday, 8th August) at half-past five. As Tickets must be reserved for many attending the Meeting from a distance, Gentlemen residing in Glasgow and the neighbourhood are requested to secure their Tickets by early application. Members of the Society will be entitled to a preference, up to Saturday the 27th of July.

The COMMITTEE DINNER, open to Members of the Society, will take place on Wednesday the 7th August, the first day of the Meeting.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, is still making the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, at 5*s.* 6*d.* each, or 3*l.* per dozen. Early in July A. P. will make the Milk-Pans of green glass of excellent quality, at 42*s.* per dozen.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED. Fountain Basins in Iron, &c.

WATER RAM.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. Specimens of Rams, Jets, &c. to be seen on the Premises, 70, Strand, London. Every kind of Garden and other Pumps, Well Engines, Baths, &c.

Sales by Auction.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, &c.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Bunney to submit to public competition, by Auction, on the premises, Kingsland Nursery, on Tuesday, July 9, 1844, and following day, at 11 o'clock (in consequence of the Lease having expired), the whole of the rare Exotics, and other plants in pots; consisting of fine specimens, Araucarias, Buonapartea, Juncea, Clivea Nobilis, Cactus, Gloxinias, Achimenæas, Magnolias of sorts, New Fuchsias, Gardenias; about 1500 Double and Single Camellias; several thousand China Arbor Vitæ, Sweet Bays, Arbutus, Cypress, &c., in pots; also eight Greenhouses, Pits, &c., in good condition; a considerable quantity of Bricks, York Paving, and other fixtures. May be viewed prior to the sale, and catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, Leytonstone.

The whole of the valuable Nursery Stock will be submitted to public competition, by Auction, about the third week in October.

TO BE SOLD by AUCTION, some time next Autumn (unless previously disposed of, but of which due notice will be given), the whole of a NURSERY STOCK, consisting of choice Fruit and Forest Trees, Shrubs, &c. &c.

The unexpired Lease of the Nursery Ground will be Let. The House, Shop, and Premises (where a large and increasing Seed business has been carried on for the last 30 years) will be either Sold or Let for a Term; if Sold, part of the purchase-money might remain on Mortgage. Any person desirous of treating for the same may apply to ALEX. SMITH, Nursery and Seedsman, Cirencester.

TO CAPITALISTS.

TO BE SOLD, to pay a clear Five per Cent., THE TOLLS arising from the Navigation of Vessels laden with Corn, Coals, Timber, Stone, &c. &c., passing along the River Waveney, from Beccles to Bungay, Suffolk, with a Capital Residence, Malting Office, Business Premises, &c., at Bungay.

The above Property is let on Lease at 1300*l.* per annum, six years of which Lease were unexpired at Lady day last.

For Price and further Particulars apply to Mr. BUTCHER Auctioneer, Norwich.

VALUABLE CHURCH PREFERMENT.

TO BE SOLD, the NEXT PRESENTATION to the RECTORY of RICKINGHALL INFERIOR, in SUFFOLK. The incumbent is in the 68th year of his age, and the Net Income arising from the Commuted Tithes, Glebes, and Surplice Fees, average about 365*l.* per annum. Also, the NEXT PRESENTATION to the RECTORY of RICKINGHALL SUPERIOR, possessing a Net Income of 437*l.* per annum.

For further particulars apply to Mr. BUTCHER, Auctioneer, [illegible]

[illegible] NURSERY, Loughborough-road, Brixton-road.

TO GENTLEMEN, FLORISTS, and the PUBLIC. [illegible] PLANTS for Bedding, selling off at One Fourth [illegible] and must be cleared in six weeks, the whole of the [illegible] E PLANTS, in Pots, upwards of 10,000, as [illegible] -flore, Scarlet, and other Geraniums, splendid assortment of Fuchsias, Verbenas, Petunias, Monthly Roses, [illegible], Heliotropes, Celsias, Anagallis, &c.—The whole of [illegible] may be had in large or small quantities to suit the [illegible]r, from 2*s.* 6*d.* to 3*s.* 6*d.* per dozen.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

The Third Meeting will take place on SATURDAY, the 13th of July, on which occasion His Grace the Duke of Devonshire, the President of the Society, has kindly directed the doors of his Gardens and Pleasure-grounds to be opened for the reception of all persons who shall have been admitted into the Society's Garden by Tickets.

Subjects for Exhibition must be at this Office on Friday the 12th, or at the Garden before half-past 8 o'clock A.M. on the day of Exhibition.

N.B. No Tickets will be issued in Regent-street on the day of Exhibition.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, JULY 6, 1844.

MEETING FOR THE FOLLOWING WEEK.

SATURDAY, July 13 . Horticultural Gardens . 1 P.M.

AMONG the many contrivances by which man has succeeded in converting the wild productions of untamed nature into bodies better adapted to his artificial wants, nothing has produced more past advantage, or promises more future profit, than HYBRIDISING. We shall not refer in this place to what has been done in the animal kingdom, but confine the attention of the reader to its effects upon vegetation.

The practice is regarded as one of very recent date; and so it is, as an artificial process, applied by rule to definite purposes. But he must be a bold man who dares assign to it historical limits; on the contrary, it may be supposed to date from the Creation — or rather, it is in a manner certain that it does. The presence of winds or insects must necessarily from the beginning have produced effects upon plants, which resulted in hybrid productions.

Hybridising is effected by applying to the stigma of one plant the pollen of some other; the end of which is the generation of a form participating more or less in the attributes of both its parents. Nature, in her wildest state, opposes no insurmountable difficulties in the way of this operation. Insects, bepowdered with the pollen of one plant, plunge into the recesses of another, and thus effectually destroy the purity of races. The natural brush on the body of a bee will convey the subtile powder as well as the trim camel's hair pencil of the artificial operator.

It is contended, indeed, that this cannot be; because if it were so, all species must, in the lapse of ages, be confounded in one inextricable chaos. But, in the first place, this supposition is of little force, till it is shown that that which is easily done artificially cannot possibly take place naturally; and secondly, it must be proved that the wild races of plants actually do remain in all their original purity. No Botanist would, we suspect, venture upon such an argument as that. The genera Salix, Rubus, Rosa, and Carex, would make the stoutest advocate of original purity pause before he threw himself into the lists. Nobody, in fact, can possibly doubt that wild hybrids exist, are common, and, perhaps, much more frequent than we think for. We will not stop to quote notorious and proved instances of this, because we regard the fact as being beyond all dispute.

Let us not, however, infer from this that no natural obstacles are opposed to the indiscriminate mixture of races in plants; on the contrary, there are barriers which cannot be overleaped. By some mysterious agency there is a complete bar to all intermixture of plants not closely related to each other. An Elm may certainly mix with an Elm, and perhaps with a Nettle-tree; but not with an Oak. A Peach may, peradventure, cross a Plum; but not an Apple. These obstacles are, doubtless, connected with the molecular constitution of plants, the precise nature of which we have no means of examining. Another obstacle consists in the obvious fact that the pollen of a flower has a better opportunity of falling upon the stigma that belongs to it, than pollen brought from any distance; and we know that if pollen has once taken effect, no after-application of other pollen can change the result. In fact, the natural hybridising of wild plants will generally take place when, owing to some accidental cause, the proper stamens of the flower prove defective.

But there is a still more effectual obstacle to the confusion of races by natural hybridising. Although we conceive that the *production* of hybrid plants naturally is of more common occurrence than may be supposed, it must be remembered that the *preservation* of them is quite an artificial process. A hybrid tree springs up; it has no means of multiplying itself, except by seed. That seed has no stable constitution, but has a tendency to return towards the condition of one of its parents; in this way the hybrid disappears, while the parents remain; or it may, and often is, barren; and then it remains as a solitary, childless individual. Again, a hybrid herb appears; it is exposed to the same obstacles as the tree, in the way of perpetuation. It is barren; its seeds of themselves tend towards the original stock, which is recovered in a generation or two; or they are at once fertilised by the pollen of one of the hybrid parents, when the tendency to a return to its original stock is increased tenfold in strength. It is not, therefore, likely that natural hybrids will often be long perpetuated, although they may be frequently produced.

We mention these things by way of vindicating the hybridisers, who have been accused of attempting to subvert the whole order of Nature by monstrous practices. It is clear that they only imitate the practices of Nature. It is equally clear, too, that the occasional formation of natural hybrids is intended as a manifestation to man of one of the sources of power with which he is so largely provided. His reason is to be called upon to turn to profitable account that which, in savage nature, leads to no result.

Be this as it may, the practice of hybridising is, as the politicians say, a *great fact*, opposition to which would be fruitless if it were desirable. People have found out how much is to be gained by it, and they cannot be checked in its application by the sighs of Botanists over the dreaded advent of a chaos of species. All that Botanists afflicted with the *hemionophobia* can do, is to abandon gardens, and seek for solace in uncultivated lands.

Hitherto the operation of hybridising has been mainly confined to gardens. But see what advantages have come of it there. What were our Roses in 1789, when the first China Rose reached England? and what are they now? The China Rose hybridises so freely with almost every other, that there is hardly an ancient species to which it has not lent some part of its rich foliage, gay colours, and abundant blooming. Can anything be more striking than the effect of hybridising upon Pelargoniums, Heaths, Gloxinias, Verbenas, and Gladioli? By this process we have given to the hardy Pears of the north all the richness and delicacy of those of the south; to watery Grapes the perfume of the Muscat; to the pale-faced but hardy Rhododendrons of Caucasus and America the rich and glowing colours of their tender brethren of India; to the gaudy Azalea of Pontus the crimson of the small-flowered fragrant species of the United States.

Such striking consequences of the very first operations in hybridising have excited a universal desire to vary and extend them. Everybody now, who cares for his garden, asks himself in the first place what he can do to get new seedlings; and to hybridising he looks exclusively for assistance. If a fine new species of an ancient family appears, its good points as a "brood plant" (forgive the innovation) are among the first things discussed; and its value is much determined by its fitness for hybridising. Nor is it to be wondered at. Hybridising is a game of chance played between man and plants. It is in some respects a matter of hazard; and we all know how much more excitement is produced by uncertain than by certain results. What increases the charm of the game is, that although the end of it may be doubtful, yet a good player can judge of the issue with tolerable confidence, and that skill and judgment have in this case all their customary value.

What the principles are to which the hybridiser should look, and where the fields lie in which his operations can be best conducted, we shall endeavour to show next week.

WE have so often urged upon our readers the importance of turning their serious attention to the establishment of GARDEN ALLOTMENTS, that we are induced, notwithstanding the extreme pressure of other matter, to give a prominent situation to the following Report, lately (June 24) made to the Garden Allotment Society of Tottenham by their Committee:—

"Your committee congratulate you *on the amount of good* which your subscriptions have enabled them to confer upon a considerable number of industrious labourers, artisans, and mechanics, in the allotment of garden ground to them, sufficient to occupy the spare time of themselves and families. Out of 76 gardens, 70 were let; the remainder could have been let to small tradesmen, but your committee *reserve them for the class for whose benefit they were originally designed.* Your committee therefore confidently appeal to the good feeling of their fellow-parishioners, and proudly ask, *In what parish, having a population approaching to* 9000, *is there less suffering and less crime than in this?* which, as your committee confidently believe, arises *in a great measure from the assistance thus afforded.* Your committee do not pretend to offer you an exhibition of floral productions, but they cannot doubt that you will derive pleasure from viewing the handiworks of the labourer, displayed in the production of various roots, and almost every variety of vegetable, useful for culinary purposes.

"Prizes of the value of 30*s.*, 20*s.*, 15*s.*, 10*s.*, and 5*s.*, and two extra prizes, given by the Rev. the Vicar, of 10*s.* each, in seeds, tools, clothing, or articles of household furniture, were awarded by the Judges as follow:—

"To the tenant whose garden shall be the neatest, most free from weeds, best cropped, and in the general best state and condition, viz.—

"1st prize, 30*s.*, to Richard Richardson, labourer; 2d do., 20*s.*, to Edward Burton, journeyman tinman; 3d do., 15*s.*, to Simon Brown, labourer; 4th do., 10*s.*, to Charles Warren, labourer; 5th do., 10*s.*, to Theophilus Rowe, shoemaker; 6th do., 10*s.*, to William Watts, labourer, 7th do., 5*s.*, to Thomas Vinton, labourer.

"The inspection of the gardens by the subscribers appeared to give great satisfaction; and resolutions were passed, authorising the committee *to extend the system* into the High Cross Ward as soon as an eligible piece of land of four or five acres can be obtained for the purpose; also to treat for the management of the allotment gardens in Marsh-lane, 56 in number, which, with those in White-hart-lane (76) and the proposed addition at the High Cross or Hall, will together amount to *about* 200 *gardens.*"

Here we have evidence of the working of the system; of its mitigating suffering, preventing crime, and conferring happiness upon that important class with whose welfare that of their superiors is inseparably bound up. What a pity it is that those who have wealth and leisure at command should not assemble in every parish to follow the good example thus set by the inhabitants of Tottenham!

FRENCH CULTIVATION of the PELARGONIUM.

(*Continued from page* 427.)

Winter Treatment.—In October the plants should be taken into the greenhouse, where they ought to have free ventilation during the winter, and as much light as possible; and it is desirable that they should be kept by themselves, or at least with plants that require the same treatment. The months of November, December, and January are critical for plants which during these months are, as it were, in a state of torpor—a state in which their vegetation ought not to be forced by any artificial means. Heat is to be avoided, and watering, except in extraordinary cases: they ought to be watered only when the earth can be easily reduced to dust with the fingers, and the leaves of the plants are on the point of withering. The water used ought to be of the same temperature as the greenhouse. The withered leaves, diseased stems, and weeds ought to be carefully removed.

Spring.—In February, the plants will commence to vegetate, and during the first fortnight of this month (though any part of it is seasonable for the operation) the Pelargoniums should be repotted with fresh earth, and the plants that require removal put into larger pots. To do this properly, the earth must be shaken entirely, or nearly so, from the roots. On examining these, the fibres will be found either entirely or partly dead, and must be separated from the large roots with the finger, which is preferable to a knife: that ought to be used only to trim the latter, if dead or decayed. The new soil used for potting should have been under a shed a few days previously, or it will be too damp. All the plants will require stakes rather higher than themselves, to which they should be tied with very flexible strings, but so that the branches be not attached too closely together. This done, they may be put back into their winter habitation. The fresh soil will not require immediate watering, especially if the weather is cloudy; but in case of bright sunshine, it will be right to shade the greenhouse for a day or two, and to water the leaves, in order to repair the loss they will experience from perspiration. The roots having lost their spongioles, the plants will not begin to grow until new roots have been acquired; therefore, to facilitate the growth of these, a watering-pot with very small holes must be employed. About the middle of April the plants will have formed new fibres, when they may be taken out of the greenhouse, and put in a sheltered part of the garden, where they may remain until the beginning of May, but so arranged that they may be covered in case of a late frost. The plants having thus passed about a month exposed to the free air, will be robust and free from insects, which are destructive to them on account of an unctuous secretion with which they cover the leaves, and which prevents perspiration and absorption: besides, it is to the presence of those insects that the attacks of ants are attributable; by destroying the former, therefore, the latter will be kept away. In the month of May, or towards the end of April, the plants should be placed where they are to flower. The precaution of covering the greenhouse with canvass from 10 o'clock in the morning until about 4 in the afternoon, will be necessary to preserve the flowers in bloom; or if the plants are placed under a shed well lighted and exposed to the east, they will receive the light of the rising sun, and have shade during the remainder of the day.

Soil for Pelargoniums. — Two barrowfuls of fresh soil, such as the decomposed sods of a good pasture-field; one barrowful of cow-dung, one of horse-dung, (both being reduced by decomposition as much as possible), and the same quantity of garden-mould. This compost should be left for a year, but turned several times with a spade and fork. When perfectly reduced and blended, it may be used, and if it be too heavy, a barrowful of common sand or river gravel may be added, or a bed of rich kitchen-garden mould will make a good soil for Geraniums, if well stirred during two or three months, and thus exposed to the influences of the atmosphere. It should be passed through a riddle before being used. Plants, with thick fibrous roots, like those of the Pelargonium tricolor, will grow better in good heath or peat-earth.

ENTOMOLOGY.

LAMPYRIS NOCTILUCA (*the Glow-worm*). Towards the end of last year an opportunity offered of illustrating the history and habits of the Italian Fire-fly, when I promised to communicate the economy of our native

species, which if not so splendid is wonderfully beautiful, and not less interesting from the early reminiscences it often awakens in the mind. Who has not, in his youth, beheld with astonishment and delight the refined and beautiful light of the Glow-worm? Who has not contemplated with admiration these little animals sparkling on a bank, or scattered like living gems amongst the brushwood? And not unfrequently have I seen them bedecking some rustic boy's hat, as he returned late from the harvest-field, "whistling as he went, for want of thought!" Such are the agreeable pictures and delightful associations which are hourly presented by Nature to those who are so fortunate as to take pleasure in exploring her pleasant and peaceful ways.

The Baron De Geer ascertained that the pupæ possess the phosphorescent qualities of the larva and imago, but in a less degree; the larvæ have been observed shining as early as March and as late as the middle of November;* but the females are most brilliant in July and August. The light is evidently increased by excitement, and the animal has the remarkable power of reviving or extinguishing its lamp at pleasure. The Glow-worms lie in the most profound repose during the day, and only become active on the approach of night, when the males fly in search of the females, guided by their brilliancy. I have observed that the males sometimes emit a glimmer, and they have been attracted in considerable numbers by the light of a candle. It appears that Mr. Dale took 40 in this way in one night; yet few persons have seen the males. They may, however, be captured by placing a female Glow-worm in the hand at night, in localities inhabited by them, when the male will often come to her.

The female lays a great number of eggs, which are attached by their glutinous surface to the Grass or herbage where they live; they are very large, compared with the bulk of the insect, being, according to De Geer, as large as Turnip-seeds; they are round, and of a citron-yellow colour. The larvæ, when full-grown, form a cocoon, I believe, which is only a soft and flexible skin, and very fragile; in this state they remain 14 days, during which period they are deprived of locomotion. The perfect insects walk very slowly, and when touched withdraw their heads and remain motionless for a long time. De Geer says that they live upon fresh earth, and Professor Henslow has ascertained that the larvæ feed upon snails, having kept two which lived upon them for three weeks in September, during which time they shone very brightly. On examining the mouths of the Glow-worm and its larva, it is at once evident that their economy must be very different; it is clear that the former is not carnivorous, whilst the formidable mandibles of the latter are admirably suited for such a mode of subsistence; in this respect the Lampyris approaches Drilus flavescens,† whose female resides in shells, and feeds upon the snails.

The Glow-worm, which only inhabits the north of Europe, received from Linnæus the name of Lampyris noctiluca: the *male* is winged, of an ochreous-brown or smoky colour, thickly punctured and clothed with very short pubescence; the head is concealed beneath the shield-like thorax, which is semi-circular, the margin projecting and slightly reflexed; the organs of manducation are small; the antennæ are short and 11-jointed; the eyes are large, black, and approximating beneath; the elytra are elliptical and completely cover the abdomen; the wings are very ample and folded beneath the elytra in repose; they are pale fuscous, with various brown nervures: the sides of the abdomen are serrated, with two phosphorescent spots on the penultimate segment, beneath: the six legs are moderately long; the tibiæ simple; the tarsi five-jointed, the three basal joints short, fourth bilobed, fifth slender, clavate, and furnished with two small claws, (fig. 1, magnified); the cross-lines exhibit the natural expansion of the male flying. The *female* is long and apterous, a little broadest at the middle, of a reddish-brown colour; the head small and mostly concealed, but it is visible when the animal is in action; the eyes are smaller than in the male; the antennæ are similar; the thorax is larger and resembles the other sex, but the margin is more opaque; the second thoracic segment is short and narrow, and, with the third, has a somewhat transparent orange spot at each posterior angle: four terminal segments, cream-colour or ochreous beneath, and phosphorescent; the six legs are shorter and stouter than those of the male, (fig. 2, the natural size). The *larva* is similar to the female, but is often much smaller when young; it is, however, when full grown, an inch long; the mouth is furnished with a pair of longish, exceedingly acute jaws, which are curved and cross each other, together with palpi, &c.: all the 12 abdominal segments have an ochreous or orange spot on each posterior angle; the six legs are short, and terminated by single claws. The minute horns, differently formed legs, and spotted sides of the body, independently of the mouth, readily distinguish the larvæ from the females. The *pupa* resembles the larva, but it is curved, and the antennæ and legs are inclosed in membranous sheaths, so that the animal is unable to walk.—*Ruricola.*

THE ROSE-GARDEN.—No. XIII.

(*Continued from page* 389)

March Pruning.—In places where the plants are much exposed, this cutting-in may be delayed occasionally even to the 15th of April, which will remove the inconvenience and injury that the delicate sort may suffer from pushing too early, and subsequent cold after pruning. During the month of March, early or late, according to the season, the operation of depriving the shoots of the wild stocks of their useless wood takes place; and from this date the return for all previous labours is commenced.

One eye being left beyond—that is, nearer the summit of each branch than the bud placed upon it—the remainder of the wild branch is to be removed; and if there be any of the stem of the tree above the highest wild shoot, that also may be cut off close to the base of the shoot, slanting, as at first directed, and the live wood now exposed is to be defended with the mixture before given—unless, indeed, immediate appearance is of no importance, or the application of the mixture be considered too troublesome, on which latter case the incision should be made when the flow of sap is at its full, or delayed till the following spring.

Sap-bud.—Upon the single bud left at the end of the wild branch the strength of the expected shoot greatly depends. The inserted bud, though almost sure to grow, is not incorporated with the tree itself; for, if a branch of a tree in its natural state be broken off, part of the tree will come off with it; not so a bud placed in the branch—it will come off as if it had been merely stuck on. The sap, therefore, does not quite so readily flow to it, and must be drawn up by a leading bud, not actually as a matter of necessity (though it almost amounts to it), but as a means of increasing success. The desideratum is to put the sap in motion, and establish its action by means of the leading bud; and when the inserted buds are fit to perform their part, to transfer the supply of the leader to them. The sap, in the present instance, may be considered as a vessel on the water, which requires some force to propel it, but when once set in motion, unless a severe check be experienced, its own weight will keep it so. It is true that the inserted bud will start without the assistance of the leader, but this is not always to be depended upon, and the final result far less so. The destruction of the leader of a tree disorganises for the time the whole vegetable economy. If the leaders of some trees be stopped, they will form half a dozen or more equal growing branches, each performing its quota of the part of the original leader; and if the leader of a creeper be destroyed, the accumulating sap sets to work the buds half way down the plant, and the produce being multiplied, the size of it is diminished. It may here be remarked that the capability of the tree, if in health, is much more than sufficient to support what is desired of it this season; if, therefore, under an impression that the tree will be weakened by wasting itself in wild produce, the sap-bud be not left, the plant will obstinately persist in showing buds at the sides of the stem, and after making a feeble shoot from the inserted bud, and this with a considerable delay, it will finish its first season with a head, not more than equal to one from a bud with a pushing eye of the same year.

In these cases the tree vegetates weakly for a season or two, and generally dies. The destruction of the sap-bud was once an error very prevalent in English nurseries, and accounted in a great measure for the inferiority and unhealthiness of their standards, but it is now generally rectified.

A tree planted with a dormant bud upon it, and little root, will frequently, if deprived of its sap-buds, hang back until the sap be powerfully collected, and break out a knot below the inserted bud, which will then commence and continue to progress with the wild one, which, although the lowest of the two, should not, under these circumstances, be knocked off (provided the other continues to increase), until it arrive at the same state of forwardness as directed for the sap-buds, when the inserted bud being ready to take up the nourishment, the wild shoot may be removed.

In all cases where the tree refuses to break above, the formation of suckers may be apprehended, particularly from clump roots, which renders it very desirable that the root should be properly trimmed at first planting. The wild bud should be left to push till it has got two or three pair of leaves, and then stopped by nipping off the point with the finger and thumb; the placed bud will then shoot vigorously, and when it is four or five inches long, the sap-bud is to be cut off nearer its base; it is not desirable to remove it entirely (though it must not be allowed to throw out long side-shoots), but barely left alive, in order to maintain the bark at the end of the branch, and the succeeding March, or even at Midsummer, if vigorous, the extraneous wood may be removed to the base of the inserted bud, the sap from which will then (if the place be lightly protected with mixture) cover the wound completely. In cases of weak growth, however, the base of the sap-bud may be left with advantage until the succeeding spring, or even summer.

It sometimes occurs that the bud of last year's insertion is by no means prepared to start; it looks like a bud at the base of any other plant, hard and immovable; perhaps two sap-buds have been left, and these, when cut in, again form shoots, which are also stopped without success, or perhaps on each side of the worked shoots, and from the same eye, buds make their appearance while the insertion is unchanged. In such cases the shoots should be shortened to one sap-bud, in order to throw the vigour of the plant into the immediate vicinity of the bud; and the shoots from the stem of the tree above mentioned, should in general be allowed to progress, and that part of the plant assisted in its general health until the inserted bud begin to vegetate, and the moment it is able to take up the circulation the extraneous shoots may be reduced as before described.

A certain quantity of leaves being necessary to keep every plant in health, it is very desirable that the leaves of the sap-buds should not be taken off until the inserted bud increases into full vigour; they afford nourishment to the plant, and take none from it, sustaining the vigour of the plant at its extremes.

It is desirable that some shoot should be free to work at the summit of the plant, which cannot always be the case when only one bud is inserted, which, flowering at its summit, sometimes restrains or stagnates a vigorous plant to a considerable degree. Hence the desideratum of three or four shoots instead of one, the jets from which will find sufficient work for the plant, to allow its flowering without injury. This any one who has remarked the capability of supplying nourishment which the wild stem possesses, and is aware of its impatience of stagnation, and speedy withdrawal of its sap, on such occasions, will at once acknowledge. It must be remembered, however, that this benefit will only be derived to such Roses as cannot be made to produce more than a certain quantity of wood, as Smith's Yellow Noisette, &c., whose thickened juices seem sometimes scarcely able to open the flowers, but there are many others in which the volume of sap seems assisted by confinement to a single channel.

No plant is so much benefited by a constant attendance upon its wants, as the standard Rose, the first year after it has been worked; the demands for which labour, if freely supplied, would far outweigh the value of any plant that could be raised.

Home Correspondence.

Asparagus.—On the 28th of July, 1843, I procured 6 cwt. of dirty salt, at 1*s.* per cwt., and applied it to three beds of Asparagus which were three years old. One of the beds had seeds sown in drills at the time it was planted; both the seed and the two-year old roots, which I had from Hamburgh, are of the Giant sort; each bed is 12 yards long and 1½ yard wide; 2 cwt. of salt was sown over each; it destroyed everything that was growing on the bed, except the Asparagus; the salt remained on the surface until rain washed it in. I then forked the bed well over, and the plants commenced growing and continued luxuriant until November, when the weather was cold and frosty. Strong heads, however, were occasionally produced until Christmas, when I cut down the stems to within 12 inches of the ground, and threw out the soil from the alleys on the beds to the depth of about 6 inches; and in this state they remained until March. I then raked off all the rough clods and stones into the alleys, taking with them the decayed stems, and forked over the beds. The plants began to shoot, and continued growing luxuriantly until about a month back, when they all turned yellow, and presented the appearance of autumn. This destroyed all my hopes; but, on examining the roots with my fork, I found out the cause. The plants about which the soil was stirred up in the morning had changed their colour in the evening. On perceiving this, I forked two rows, the whole length of the bed; next morning these had also changed colour. I then set to work in good earnest, and forked all my beds over. The soil turned up in great clods, down to the very crowns of the roots, pulling up with it several young shoots. I was obliged to split the clods before they could be got from amongst the stems; these clods I pulverised in the alleys, and then returned the soil to the beds. Before spreading it on the beds, however, I put four quarts of Poittevin's disinfected manure between the four rows of plants, and then covered over the bed with the soil; next morning the stalks were covered all over with a fine dew, and were of a beautiful green. I have no doubt but the cause of the evil is the exclusion of air from the roots, and bad drainage. The average height of my Asparagus is now more than 6 feet, and young shoots are continually being produced, as if it was spring. Poittevin's manure is the best fertiliser in dry weather of any of the patent manures: this I have proved in many instances during this dry summer. I have used it for four years, but never before applied it to Asparagus. Next summer I propose using half the quantity of salt, mixed with 18 "strikes" of sea-sand, fresh from the beach. A good dressing of salt once in two years is often enough; it destroys all weeds and damps the land. The three beds are salted as before, and being well forked up in March, the seedlings are rising luxuriantly since the rain. I am convinced that salt will neither destroy plants nor seeds of Asparagus or Seakale.—*Wm. Coulam, Louth, Linc.*

Judges.—Your observation, in Leading Article of the 22d inst., that "Fairness in judging is the first element of success. People are contented with awards, although unfavourable to them, if they are certain the judges are perfectly conscious in their decisions. But if men are not satisfied on this point good-bye to all chance of holding them together"—is one that ought to be deeply impressed on the minds of all managers and judges, more particularly of small and provincial societies, where all semblance of unfairness and deviations from a society's rules—whether these deviations be caused by prudence, malice, or ignorance—are sure to be felt and resented as a grievance. Several cases corroborating this have from time to time, during the last twelve months, come under

my own observation, and I shall relate them shortly in such a way as to allow you to affix your judgment to each instance. 1. A prize being offered "for the newest and best Annual," would it be fair to award the prize to Mesembryanthemum tricolor, a plant that has been in the country for 50 years?—[If it were both the newest and best, yes; not otherwise.] 2. A prize being offered "for the six newest and finest-flowered stage Pelargoniums in pots, with names," would it be fair to award the prize to spindled, pale-foliaged plants, having numerous trusses of individually inferior flowers of Caroline, Florence, Flash, Fair Maid of Devon, Black Dwarf, and Grand Monarch, to the exclusion of compact, dark-green-foliaged plants, having comparatively but few trusses of individually splendid flowers of Constellation, Cleopatra, Diana, Armynta, Sapphire, and Comte de Paris?—[No.] 3. A prize being offered "for the finest grown specimen of any recently-introduced perennial herbaceous plant in flower, with name," would it be fair to award the prize to a potful of Achimenes grandiflora, to the exclusion of a single plant of Achimenes grandiflora, better grown than the other, so far as single plant for single plant went, being considerably the tallest of the two, clothed with large dark-green leaves from the pot upwards, and having, although necessarily fewer yet better-coloured flowers?—[This could only be ascertained by inspection. According to the case here put, it would not be a fair award.] 4. A prize being offered "for the finest grown specimen of any rare, tender, shrubby plant or flower," would it be fair to award the prize to a plant about two feet in height, and about same diameter, of the comparatively not rare, not tender, Pimelea decussata var. rosea, to the exclusion of a plant upwards of one foot high and two feet in diameter, of the comparatively rare and tender Turnera elegans? [No.]——As these instances are not altogether imaginary, and as a deep and extensive suspicion seems to be rapidly engendering against Horticultural Societies in general, that may ultimately, and soon advance to a serious reaction against them, it becomes necessary—you will allow surely—to comment on and check all misunderstandings and instances of unfairness. —*C. M. C. H. S.*——[We can only add, that the motto of the Judge should be *fiat justitia, ruat cœlum*, which, being interpreted signifies, Do what is right and fair, without caring who is pleased or offended.]

Pine Apples.—Having a very large Pine stove capable of holding nearly 100 fruiting plants, heated with hot water, both for bottom and top, I resolved, about six months ago, to adopt different plans of fruiting them. For this purpose I had the bed divided into three compartments. In the first division the pots are suspended from holes formed on a wooden stage by their rims, into a hot-air chamber, by which it receives its heat from hot-water pipes, with dishes to hold water passing underneath, about 4 feet deep. In the second division brick pillars were raised a few inches above the pipes, and a bottom of flag and large pieces of broken brick was formed, upon which about three loads of tanners' bark were placed for plunging the pots. The third division was also covered in the same manner, but instead of tan bark, a thick coat of manure was laid over the brick-bats. The pit was then filled with fresh peat and river sand, well mixed together: 36 succession plants were planted out in this compartment, and each division containing about the same number; the sorts are nearly all Black Jamaicas. Attention has been paid to airing, watering, and keeping a steady surface-heat, and, as far as could be judged, to keeping a regular bottom-heat; the plants are very strong and healthy, and many have sent up suckers, but hitherto, with one exception, no fruit has appeared. It is impossible the plants could have a better appearance, but I am much disappointed in not having fruit,—especially as in Mackintosh's "Practical Gardener" it is stated that "Pines starting into fruit in August, may be considered tantamount to being lost." Can any of your correspondents suggest a method likely to be successful in bringing them into fruit before August?—*A. B. C.*

Bees.—In the *Gardeners' Chronicle*, p. 197, 1841, "An Old Correspondent" will find that I have recorded a similar instance of interment with his own, attended by a like successful result. To obviate such a fatal event as succeeded, I know of no sure remedy but the removal of one of the families beyond the usual range of the bees' flight, till the flowers afford them an ample supply of honey.—If a "Constant Reader" will refer to page 284 of the 1st edition of the "Honey Bee," or 328 of the 2d edition, he will find that I there recommend the use of volatile alkali, for the same purpose and for the same reason that he makes use of the fixed alkali; and the former has this advantage over the latter—it is more penetrating, and no caution is required in the use of it. I have always found it speedily effectual.—*Edw. Bevan, Esgair Evan, Newtown, Montgomeryshire.*

Bees.—Having read several articles on the conservative system of keeping bees, so as to prevent their swarming, which some apiarians imagine is the best plan, I tried the following experiment with two old stocks:—On the 6th of May they showed every symptom of swarming, and in order to prevent them from doing so, I placed a large hive under each. The hives are 14 inches deep, and the same in diameter; each is made with a wooden top and a hole in the centre 1½ inch square; the bees soon filled them with comb, and on the 8th of June one of them, although well shaded, swarmed; the swarm weighed 5 lbs. The other has not swarmed yet. On the 18th of June I took off the top hive from the one that had swarmed, and from it I obtained 20 lbs. of very clear and good honey; there was a small quantity of brood near the bottom of the hive in two of the combs. Now, I am desirous of information on the following points:—If I take the hive off the top of the other hive (which is exceedingly strong) will not the decrease in room cause it to swarm? Again, if I leave it on much longer, and then take it away, will not the bees be prevented from procuring sufficient food for their support in winter, as there is no place here to which they may be transported in autumn for a supply? Will not an old stock work up as well as down? Any experienced apiarian who will kindly answer these inquiries, will greatly oblige—*A Cottager, West Dean, Sussex.*

Sting of Bees.—Apply the blue-bag used by the washerwomen. Five minutes ago (and which induced me thus to address you) I was stung by one of my bees, who made three distinct attacks before he could succeed. I applied the bag, and the pain ceased instantaneously. I have tried the same remedy before, both on myself and children, and always with the same result.—*F. G. C. Aston Hall, Hawarden.*

Humphreys's Compound.—The letter of "F. R." attracted my attention, as well as that of Mr. Humphreys, and I felt anxious to know if the remarks made by that writer may be trusted, as also whether the explanation offered by Mr. H. is admissible. That the Compound contains no phosphate of lime is admitted, but who ever heard of guano without it? As well might we speak of syrup without sugar, or brine without salt! But it is stated that, although phosphate of lime is absent, phosphoric acid is present, and that in a state more generally available. Of course, if this be the case, it is capable of proof, and a simple experiment will suffice for this purpose. I took a portion of Humphreys's Compound, and found it readily soluble in water. The solution was diluted, made alkaline with pure ammonia, and a drop or two of solution of chloride of calcium added to it. There was not the least precipitate or opalescence produced, even after some length of time, which would have been the case if phosphoric acid had been present. To prove this position, a glass rod was dipped into a very dilute solution of phosphoric acid, and applied to the mixture. The well-known appearance of precipitated phosphate of lime was almost instantaneously observed. This experiment must, I think, be admitted as conclusive; and if so, we have before us the anomalous statement that a "liquid guano" can be produced from a "compound" not only not containing phosphate of lime, but utterly devoid of phosphoric acid in any shape! When Mr. H. proposes by public advertisement to substitute his preparation, excellent as it is for some purposes, for my "liquid guano" (for this is evidently pointed at), he should first rub up his chemistry a little, or at least give others the credit for not taking an unsubstantiated assertion as indisputable fact. In conclusion, I should propose that, instead of regaling the public with our discussions, and occupying, very unprofitably to you, your valuable pages, that Mr. H. be so good as to withdraw the objectionable part of his advertisement, and let each of us prosecute our career without interfering one with the other; for, surely, there is plenty of room for both, without jostling or falling out by the way.—*W. H. Potter*, 28, *Upper Fore-street, Lambeth.*

Horehound.—Many thanks are due to your correspondent (p. 375), for having directed attention to the valuable properties of the Horehound in cases of influenza, &c., as restoring the tone to the stomach, and allaying irritation. I question, however, if the generality of your readers would venture upon a second glass of the mixture there prescribed, owing to the peculiarly bitter character of the plant. The mixture I have seen used for the same purpose, though probably less efficacious than that of "M.D." was certainly more palatable. It consists merely of a strong decoction of Horehound (prepared in the same manner as Camomile-tea), sweetened with honey to the taste. Any tolerable hand at taking medicine will find no difficulty in drinking a wine-glass or two of this mixture the first thing in the morning, or at any time when oppression on the stomach is felt. Yarrow-tea is in some parts of Yorkshire a favourite beverage among the old women, the effects of which are possibly similar.—*M. A.*

Labelling.—Allow me to say that, although I referred to the "Rose-garden," I think the labels and my little implement applicable in other ways. I use such labels to my fruit-trees, plants in pots and borders, to my wine bins, &c. Those, however, who, like me, detest to see that crooked which ought to be straight, may find themselves disappointed with a few round-based letters—the c, g, j, o, q, and u. The makers of the punches—why, I cannot tell—are apt to leave them thicker in the edge than the other letters, which causes them to stand higher than the true line. A file will sometimes correct the punches; if too hard for it, as generally they are, any cutler or whitesmith will do it on his grind-stone. The q, however, is nearly impracticable; his tail will not let him "keep the line." The only way, I believe, is to use the o instead, and, with a knife, the corner of a small chisel, or a graver, give him his appendage afterwards.—*W.*

Societies.

HORTICULTURAL SOCIETY OF LONDON.

July 3.—W. H. Pepys, Esq., in the chair. His Majesty the King of Saxony was elected an honorary member of the Society; and the following gentlemen were elected fellows—Sir T. Tancred; J. B. Philips, Esq.; Dr. W. Speir, and Mr. F. C. Ball. The Exhibition included several objects of great interest. Sir W. J. Hooker sent from the Royal Botanic Garden, Kew, the charming Thunbergia chrysops, remarkable for its eye of gold in a field of the richest purple; a beautiful specimen of Dracophyllum gracile, with its clusters of snow-white flowers; a noble new species of Justicia, resembling J. carnea, but with leaves as soft as velvet; a new species of Oncidium allied to O. Baueri, but quite distinct, from central America; and several other interesting things.—Mr. Best, gr. to Alexander Park, Esq., Merton Grove, Surrey, obtained the Silver Knightian Medal for a *new shrubby* Nolana, with large sky-blue flowers; this plant may be expected to become a very valuable addition to our collections, if, as is probable, it will grow out of doors like a Pelargonium during the summer.—Mrs. Mason, of Copt Hewick, produced blossoms of that Passiflora membranacea, largely distributed by the Society from Mr. Hartweg's seed, with beautiful foliage, which no one had succeeded in throwing into flower; it proves to have pale lemon-coloured blossoms lying within a pair of pale purple bracts, looking exceedingly like some gay bivalve shell.—Seedling Calceolarias came from W. C. Alston of Birmingham, and Mr. Jones, gr. to Sir Moore Disney; and seedling Pelargoniums from Mr. Fish, of Colney House.—Mr. Glendinning, of Turnham Green Nursery, produced a beautiful little specimen of the splendid Clerodendron infortunatum, which is thus shown to blossom freely while small.—Roses, Brachycomes, and other plants were received from Mr. Jones, who also gained a Certificate of Merit for a nice dish of Black Tartarian Cherries.—Of Fruit there were some remarkable specimens.—Mr. Hugh Frazer, gr. to E. D. Davenport, Esq., produced four Providence Pines, weighing respectively 6 lbs. 2 oz., 8 lbs. 12 oz., 7 lbs. 2 oz., and 6 lbs. 15 oz., and obtained a Silver Banksian Medal for the first, which was handsome as well as heavy. Next him came Mr. S. Rylance, gr. to J. B. Glegg, Esq., to whom a Certificate was given for a very pretty Providence Pine, weighing 4 lbs. 8 oz.—Among Melons was a Hoosainee from Mr. Hendry, gr. to the Rev. Wm. Antrobus, weighing 12 lbs. 3 oz., for which, although degenerate, a Banksian Medal was given, because of its good cultivation.—Mr. S. Rylance also produced another of the same kind, and, like that, of a runaway sort, weighing 5 lbs. 1 oz.—Finally, Strawberries were shown by Mr. Bulger, gr. to R. Wrench, Esq., and by Mr. Fish, who also produced a seedling, but it proved coarse, and deficient in flavour.—Of the Plants from the Society's Garden the most interesting was a beautiful plant of Elæocarpus cyaneus, loaded with snow-white cups, cut at the border into feathers. Few people flower this species; the specimen produced had been exposed to a long season of heat, comparative dryness, and bright light, in the iron conservatory; Lindleya mespiloides, one of the sweetest of fragrant evergreens, but tender, was there in beauty. Finally, the result of a trial of charcoal *versus* bone-dust, as applied to Fuchsias, was produced in the form of two plants of Fuchsia Chevalieri: they were struck from cuttings in one pot, and were potted off on the 15th Feb. A thumb-pot full of bone-dust was mixed with the soil in which one was potted; the other received the same quantity of charcoal; each was potted in a 48. For a few weeks the only perceivable difference was, that the one in bone-dust had leaves of a much darker colour than the other. Both were repotted on April 26th, into 16s, a 60 pot of bone-dust being then given to the one, and of charcoal to the other, in the same way as before; both plants had grown so much alike, that it was hardly possible to say which was best; and thus it appeared, that good as bone-dust is, it is equalled by charcoal in the treatment of Fuchsias for specimen plants.

ROYAL BOTANIC SOCIETY OF LONDON.

July 2.—The third and last Exhibition for the season was held in their gardens, Inner Circle, Regent's Park. The morning was exceedingly wet and unpromising, but towards noon the sky began to clear, and the afternoon, although cloudy, continued favourable. At this Exhibition, although less showy than either of the two former meetings, there was a considerable number of plants that strikingly exemplified both skill and good management.

Of the two LARGE COLLECTIONS present of stove and greenhouse plants, that of Mr. Barnes, gr. to G. W. Norman, Esq., contained the greatest number of well-grown specimens, comprising a variety of Clerodendron squamatum; Aphelexis humilis, loaded with flowers, which, on account of the dulness of the day did not open; Stephanotus floribundus, finely in bloom, trained on a wire trellis; Swainsona galegifolia, with beautiful purple blossoms; an Ixora coccinea, and a dwarf-spreading specimen of Phœnocoma prolifera. In this group was also a beautiful Rondeletia speciosa; Lilium longiflorum, small, but a mass of white bloom; and Leschenaultia formosa, dwarf and bushy, together with several well-grown Heaths. The other was from Mr. Hunt, gr. to Miss Traill, and, except in a few instances, was little inferior to the preceding. It contained, among others, a well-managed Leschenaultia formosa, covering the pot; Clerodendron squamatum, having five fine spikes of brilliant scarlet flowers; Sinningia velutina, with delicately-spotted, cream-coloured blossoms; a small, but beautiful Rondeletia speciosa; a large pot of Achimenes longiflora, in fine condition; together with an excellent Boronia serrulata, and a magnificent specimen of Crowea saligna, 5 feet high, in luxuriant health.

Collections of 20 STOVE and GREENHOUSE PLANTS were contributed by Mr. Bruce, Mr. Baker, and Mr. Green; and in the nurserymen's class by Mr. Frazer and Mr. Pawley.—Mr. Bruce sent a large Coleonema pulchrum, the gracefully drooping branches of which were loaded with small pink blossoms; an exceedingly well cultivated Aphelexis humilis, exhibiting a mass of bloom; a large

Euphorbia splendens, Phymatanthus tricolor, and a good Cactus speciosissimus.—The group by Mr. Baker, gr. to — Lindsay, Esq., although somewhat inferior to these, comprised good plants, and among them Dracophyllum gracile, covered with clusters of snow-white blossoms, was conspicuous; as was also Sollya linearis, producing deep blue flowers, trained on a wire trellis; Achimenes longiflora and rosea, together with the sweet-smelling Erica odorata.—From Mr. Green, among others, was a handsome Stephanotus floribundus, in excellent health, trained on a circular trellis; Nematanthus longipes, with dark-red, drooping blossoms; a good Sollya heterophylla, and a small Gloxinia rubra.—In Mr. Frazer's group, which contained healthy, well-managed plants, three Crassulas were particularly noticeable for their fine heads of bloom, viz. nitida, grandiflora miniata, and coccinea. Mr. Frazer also sent a pretty Angelonia Gardneriana; a small but good Gardoquia Hookeri; Crowea saligna, particularly fine; along with a large bush of Vinca rosea alba, and a small Roella ciliata.—Mr. Pawley contributed a variety of Cattleya Mossiæ, called superba, with very large showy blossoms; Æschynanthus ramosissimus, trained on a wire trellis; Stephanotus floribundus, in luxuriant growth, and other plants equally evincing good treatment.—Groups of ten stove and greenhouse plants were from Mr. May, Mr. Taylor, and Mr. Slowe. Mr. May's collection comprised a magnificent Ixora coccinea; a large Pimelea hispida, Polygala cordifolia, covered with purple blossoms; Crowea saligna, in good health; and a pretty Pimelea decussata.—Mr. Taylor sent Myoporum parviflorum, producing white star-like flowers; Lantana aculeata, Gesnera splendens, and Diplacus aurantiacus, covered with orange blossoms.—From Mr. Slowe were Clerodendron paniculatum, Crowea saligna, Statice arborea, a good Mahernia pinnata, and a small Vinca rosea. Of Stove and Greenhouse Climbers, Mr. Frazer contributed Hoya carnosa, Sollya linearis, heterophylla, and angustifolia, Stephanotus floribundus, and a handsome Manettia cordata.

Collections of ORCHIDACEÆ were exhibited by Mr. Hunt, Mr. Cox, and Mr. Barnes. Among them there was nothing particularly novel or striking. Mr. Hunt sent good plants of Cattleya crispa and Mossiæ. Mr. Cox had a variety of Stanhopea insignis, in good condition; together with Oncidium pulvinatum, and Miltonia spectabilis; and from Mr. Barnes was a good Calanthe veratrifolia and an Aerides odoratum in fair condition.—Mr. Jackson, of Kingston, showed as a single specimen Brassia Wrayæ.—Messrs. Henderson, of Pine Apple Place, sent (not for competition) among others, Cattleya Forbesii and Rodriguezia recurva, the latter with two drooping racemes of pale-yellow blossoms.—Of HEATHS there was a good display. Collections of 15 were contributed by Mr. May and Mr. Barnes, and in the Nurserymen's Class by Mr. Jackson, Mr. Pawley, and Mr. Fairbairn. The group by Mr. May was the best, and contained a very fine large specimen of radiata, four feet across, in robust health, and covered with handsome red and white flowers; the neat small flowering comosa alba, the free-blooming Savileana, a handsome small plant of depressa, and a fine viridiflora, covered with its singular drooping green blossoms.—Among the plants supplied by Mr. Barnes, were obbata, with handsome large white flowers; a variety of tricolor, called splendens, retorta major, which is an excellent Heath, and a small elegans in good health, together with perspicua nana, which was in fine bloom even thus late in the season; and a good gemmifera finely in flower.—Mr. Jackson sent an immense bush of a variety of ampullacea, named Eassoniana; jubata, very large and covered with bloom; Jasminiflora in fine health, and a variety of ventricosa, called Bothwelliana, 4 feet high and about 3 feet in diameter, completely loaded with delicate pink blossoms. From Mr. Jackson was also depressa in good health, several varieties of tricolor, and a handsome specimen of Westphalingia, quite a mass of red bloom.—Mr. Pawley sent a large ventricosa stellata, a lovely splendens, a well-grown Cavendishii, and a small depressa in fine health.—From Mr. Fairbairn, among others, was cubica loaded with drooping little bells, a distinct variety of ampullacea called rubra, and small plants of Irbiana and princeps.—Mr. Green exhibited in collections of 15, but was disqualified on account of producing only 14 plants.—In 6 Heaths, the best plants were shown by Mr. Hunt and Mr. Dawson, of Brixton-hill; both these groups contained admirable specimens; among those of the former, we noticed Massoni, dwarf and bushy, and in fine health; Cavendishii, in excellent condition; gemmifera, large and in profuse bloom; and Westphalingia, very fine;—among those of the latter was a beautiful specimen of ampullacea major; Irbyana, covered with pink flowers, and the free-flowering mutabilis.—Mr. Taylor and Mr. Frazer also showed creditable plants in this class; Mr. Taylor likewise contributed 6 Statices, in which was a good plant of puberula.—From Mr. Burley, Limpsfield, was a seedling Heath named tricolor pallida.—Of single specimens, those most worthy of remark were a most beautiful large Erica Jasminiflora alba from Mr. May; a magnificent Statice macrophylla in robust health from Messrs. Lucombe and Pince; and a large Erica Hibberti in luxuriant growth, but scarce of bloom, from J. Wells, Esq., of Bromley; specimens of Luxemburgia ciliosa, Cyrtoceras reflexum, Ixora acuminata, and a small Cuphea strigillosa, were likewise shown by Messrs. Lucombe, Pince, and Co.—Mr. Green sent Gompholobium splendens, having large yellow blossoms; and a specimen of Fuchsia attractor was contributed by Mr. Noble, gr. to R. Mangles, Esq.—From F. G. Cox, Esq., was a large Erythrina laurifolia.—Mr. Jackson produced Statice sinuata, in good condition, and a plant of Dracophyllum secundum, with curious dull-coloured flowers.—The Gloxinias, named Cartonii, having beautiful rose-coloured blossoms, tinged with white, was shown by Mr. Bruce.—A collection of Achimenes was sent by Mr. Dobson, gr. to Mr. Beck. They were in lovely condition, being clean, healthy, and presenting an unbroken mass of bloom; than these it is scarcely possible to find a finer instance of good management.—A collection of Roses, in slate tubs, from Mr. Dobson, were not less remarkable. Among them was a most beautiful specimen of General Allard, producing a multitude of large pink blossoms; others were Coutard, Madame Desprez, Triomphe du Luxemburg, Accidalie, Aimé Vibert, Robin Hood, &c.—A large group from Messrs. Lane and Son, equally good, comprised many fine varieties.—A great quantity of Cut Roses was exhibited, in unusually fine condition, by Messrs. Lane, Betteridge, Milne, and other growers. Among miscellaneous objects, we noticed two groups of Dwarf Cacti, some British Ferns, a few Alpine plants, dried specimens of Cereal Grasses, and a small quantity of Fruit.

The PELARGONIUMS, though not so good as at the last meeting, were very fine and brilliant in colour. A specimen of Matilda, in Mr. Dobson's collection, deserves particular notice; this was perfect, and a complete mass of bloom. The 1st Prize, for 12 varieties in 24-sized pots, was awarded to Mr. Dobson: this collection consisted of Dido, Leonora, Meteor, Bella, Lucy, Angiola, Erectum, Lucy Matilda, Lord Chancellor, Cleopatra, and Flora. There was no competition in this class.—For 8 varieties in 24-sized pots, in the amateurs' class, the 1st Prize was awarded to Mr. Staines, of Middlesex-place, for the Fair Maid of Devon, Duke of Wellington, Anna, Princess Royal, Clio, Beauty, Matilda, and Priory King.—2nd, to Mr. Coysh, gr. to R. Hudson, Esq., Clapham, for Queen of Beauties, Beauty, Witch, Erectum, Acme, Priory King, Mabel, and Lord Mayor. Mr. Gaines and Mr. Catleugh were the only exhibitors in the Nurserymen's Class: the former obtained the first Prize for the following 12 varieties in 12-sized pots—Lady Isabella Douglas, Grand Duke, Antiope, Sirius, Una, Amaranth, Madeleine, Cyrus, Mabel, Amethyst, The Cid, and Album perfectum.—Mr. Catleugh's collection consisted of—Witch, Erectum, Priory Queen, Acme, Selina, Hebe, Jubilee, Coronation, Marsala, Grand Monarch, Gipsy, and Queen of the Fairies.—For 12 varieties in 24 sized-pots, Mr. Gaines again took the 1st Prize—for Mogul, Gaines' Elegans Novum, Madeleine, Albini, Queen of the Fairies, Hermione, Achilles, Lady Sale, Harriet, Priory King, Queen of Bourbons.—Mr. Catleugh exhibited—Myra, Nestor, Rosetta superb, Sultana, Dido, Sir R. Peel, Garth's Constellation, Madeleine, Pulchellum, Symmetry, Juliet, Gipsy.—A large specimen Pelargonium, named Floridum, exhibited by Mr. Gaines, was recommended for a Prize.—A Prize of the 2nd Class was awarded to Mr. Ayres, gr. to J. Cook, Esq., for Scarlet Geraniums, consisting of Gen. Tom Thumb, (seedling) and Smith's Emperor. CALCEOLARIAS.—*Amateurs.*—A 1st Prize was awarded to Mr. Barnes for Maculata, Lady of the Lake, Pride of Kent, Cotherstone, Competition, Colossus, Elysium, and Mabel. *Nurserymen.*—Mr. Gaines obtained a 1st Prize for Aurea, May grandiflora, Lady Sale, Attila, Cyrus, Tigrina, Sunbeam, and Prince of Wales.—The FUCHSIAS generally were in fine condition; Mr. Gaines, to whom was awarded the 1st Prize, exhibited 12 well-selected and finely-grown plants—Paragon, nobilissima, majestica, Britannia, excelsa, alata, formosa elegans, Lanei, Cormackii, Eclipse, Defiance, and robusta. 2d Prize to J. Simpson, Esq., Thames Bank, Pimlico, for Dr. Gardener, Cormackii, Stanwelliana, Eppsii, Rogersoniana, racemiflora, Buestii, formosa elegans, and Eppsii. A good collection from Mr. Halley, of Blackheath, and another from Mr. Laing, of Twickenham, were recommended by the Judges for Prizes. CARNATIONS AND PICOTEES, in stands of 24 varieties: the 1st Prize for Carnations was awarded to Mr. Norman, of Woolwich; the 2d, to Mr. Willmer, King's Road, Chelsea, for Picotees. Mr. Dickson, of Acre Lane, Brixton, obtained the 1st Prize for Gidden's Lydia, Annesley's Plenipo, Coxe's Victoria Regina, Willmer's Queen, Barraud's Borderer, Kirtland's Duke of Wellington, Martin's Queen Adelaide, Wilson's Pluperfect, Sharp's Agitation, Edmond's Ada, Willmer's Princess Royal, Ely's John Bull, Martin's Queen of Violets, John's Prince Albert, Ely's Marchioness of Waterford, Barraud's Coriolanus, Kirtland's Queen Victoria, Willmer's Mary Ann, Sharp's Gem, Brinkler's Lady Chesterfield, Trip to Cambridge, Sharp's Cleopatra, Gidden's Teaser, and Vespasian.—To Mr. Edmonds was awarded the 2d Prize, for Willmer's Bifrons, Peter the Great, Annesley's Sanspareil, Burrough's Mrs. Bevan, Kirtland's Wellington, Cockburn's Champion, Sharp's Cleopatra, John's Prince Albert, Miss Annersley, Nottingham Hero, Crask's Princess Victoria, Lady Chesterfield, Garratt's Lady Dacre, Sir R. Peel, Edmond's Ada, Sharp's Agitator, Willmer's Elizabeth, Willmer's Queen Victoria, Brinkler's New Purple, Kirtland's Princess Victoria, Wood's Agrippina, Gidden's Teaser, Sharp's Fairy Queen. An Extra Prize for Picotees was also awarded to Mr. Norman. — PINKS in 24 varieties: 1st Prize to Messrs. Brown and Atwell, Uxbridge; 2d, to Mr. Hardstone, St. Mary Craye.—PANSIES in collections of 36 varieties: 1st Prize, Mr. Parsons, Ponders End; 2d, Messrs. Goode, do.; 1st Prize to Mr. Smith, Hornsey-road, for a collection of cut bloom of Verbenas. Extra Prize to Mr. Ayres, gr. to J. Cook, Esq., Brooklands, for the same.—PELARGONIUMS.—*Seedlings.*—A 2d Prize to Mr. Beck, for a seedling variety, named *Aurora*; 3d, to Mr. Silverlock, Chichester, for *Emperor Nicholas*; Certificate to Mr. Staines, for *La Polka*. A 1st Prize for a Pelargonium containing the nearest approach to scarlet, to Mr. Beck Isleworth, for *Igniferum*. A certificate to Mr. Diplock, gr. to M. Emanuel, Esq., for a scarlet Geranium, named *Antagonist*; do. to Mr. Henderson, for a Pelargonium, named *Lady Peel*: 1st Prize to Mr. Halley, Blackheath, for a Seedling Fuchsia, the *Highland Chief*. An Extra Prize was awarded to Messrs. Lucombe and Pince, of Exeter, for cut bloom of a Seedling Pelargonium.

COUNTRY SHOWS.

[We shall endeavour to dispose of all arrears of this kind on Saturday, July 20.]

Reviews.

The Botany of the Antarctic Voyage of H.M.'s Discovery Ships Erebus and Terror, in the years 1839—1843. By Joseph D. Hooker, M.D. 4to. L. Reeve. Monthly Parts.

ALTHOUGH the English are the great discoverers in the annals of South-sea geography, and botanists have been attached to the more important of those perilous southern voyages, yet the English public has little for which to thank the scientific gentlemen. On the contrary, when their cost is compared with the result, it would have been better to have saved the money. In Cook's first voyage, large Botanical collections were made by Dr. Solander; but his materials are chiefly known from occasional allusions to them by writers who have access to the Banksian collection. To the general public they have produced little advantage. With Flinders's voyage, a Botanist and a Botanical draughtsman were associated, at the public charge; and both these officers discharged their duty of collecting materials most zealously. But if we inquire for the public Botanical advantage which has been derived from that expedition, either to ourselves or the New South Wales colonists, we find it to consist of little more than—1st, a Latin fragment, dated 1810, the publication of which was so managed, that after a time it was withdrawn from circulation in this country, and is principally accessible through German reprints; 2d, some learned general remarks, geographical and systematical, and a few plates with Latin descriptions, appended to Flinders's account of his voyage; and 3d, 15 folio plates of plants, also a fragment. These were expressions of intentions, and no more. That full account of the Botanical discoveries made during Flinders's expedition, which the public had a right to expect, has never appeared. The dried plants, or what remains of them, are to be found in the cases of the British Museum; and the beautiful plates made by Mr. Ferdinand Bauer with such care and admirable skill, after slumbering for years at the Admiralty, are now (we understand) also at the Museum. No publication of them has taken place in this country beyond the few cases already mentioned; what their merits are we chiefly know in consequence of their having been partially made public in VIENNA!

Things, however, are changed; and gentlemen employed in the public service now feel that they have other duties to perform besides those of drawing pay and drying plants for their own private satisfaction. When Dr. Joseph Hooker was appointed to the charge of the Botany of Sir James Ross's most interesting voyage, we were persuaded that in him at least there would be no want of a determination to convert the results of the expedition to their legitimate purpose—the public information; and that, too, without a moment's unnecessary delay. Nor have we been disappointed. Sir James Ross only returned to England last September, and we have now before us the first of a series of quarto Numbers of a publication which is to contain 500 plates, illustrating the vegetation of the country examined. Eight months have sufficed to land and arrange the collections, to obtain a Government grant of 1000*l.*, to overcome all difficulties connected with publication (and they have been both many and great), to get plates enough ready for a commencement, and to produce 28 quarto pages of letterpress. Dr. Hooker has thus set an excellent example of what energy can accomplish, and has put it out of the power of others hereafter to defer the completion of their task upon the plea of difficulties that cannot be overcome. All such difficulties may be overcome where the will exists.

Nor does this important publication bear marks of haste; on the contrary, the letterpress, drawings, and plates are all that could be desired. We have a brief account of the voyage itself, explaining clearly the ship's course, and giving a useful sketch of the general nature of "Lord Auckland's group and Campbell's Island," the vegetation of which is first treated of; and when we add that the work is wonderfully cheap, we are sure to enlist all lovers of natural history among its cordial supporters.

The plates of the first Number consist of Ranunculus pinguis and acaulis, two species—especially the latter—interesting from their exhibiting in their petals a clear tendency towards forming the spurs of an Aquilegia; three species of Cardamine from Campbell's Island, Geranium microphyllum, a curious little Epilobium called linnæoides, a singular little Sieversia, and an umbelliferous plant, of considerable beauty, from Lord Auckland's group. This plant, the Anisotome latifolia, is described as a noble species, often growing 6 ft. high, and bearing several umbels of rose-coloured or purplish flowers, each compound umbel being as large as the human head. The whole plant is aromatic.

Lord Auckland's group is in about the latitude of Devonshire, and it is interesting to compare the vegetation of that country with the Flora of the antipodes. We

there find many an old familiar face, speaking of home and its comforts; we see Ranunculuses, Cardamines, common Chickweed, Sundews, and Geum-like plants, mixed with Epilobiums, Callitriche, and Montia fontana: but to remind us that we are, nevertheless, in a strange land, Acænas mix with the herbage, and a Myrtaceous tree (Metrosideros lucida), from 20 to 40 feet high, unfolds its crimson flowers.

We await with impatience the continuance of this most interesting book.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

GOMPHOLOBIUM HENDERSONII. Messrs. Henderson's Gompholobium. *Evergreen Shrub*). Leguminosæ. Decandria Monogynia.—This plant belongs to a genus extremely elegant and ornamental. G. polymorphum is probably the most universally known of any of its members, and is remarkable for the tenuous gracility of its stems, and the bold and conspicuous arrangement of its beautiful blossoms, and it is also a plant of quick growth and easy culture. G. Hendersonii possesses a character which differs widely from this, though it is no less distinguished for beauty. Instead of shoots remarkable for great length and tenuity, it is, on the contrary, a small dwarf bush, of a slow growth, and very stiff rigid habit, approaching more nearly to G. ericifolia. The leaflets are small and narrow, always ternate, whilst those of G. polymorphum are sometimes three and sometimes five. The flowers are scarcely so large, but are produced in equal abundance, and near the extremity of the shoots. Seeds were sent over by Captain Mangles from the Swan River in 1840, from which plants were raised in the following spring. This plant flowered in the nursery of Messrs. Henderson, of Pine-apple-place. Considerable skill and attention is necessary to preserve this species, and indeed many of the slow growing New Holland plants, in a healthy growing condition. It is one of those delicate-rooted plants which are so extremely susceptible of injury from the careless application of water. Nothing is more likely to prove fatal than either to allow the soil to become too dry, or to maintain it in a wet and sodden state. At each application sufficient water must be given to moisten all the soil contained in the pot. Slight waterings, though often repeated, are not so beneficial as one copious application: as the surface of the soil alone becomes moist, and the great bulk which surrounds the roots of the plant, and on which it is chiefly dependent for nourishment, remains almost as dry as before. A peaty soil of a fibrous nature, with a trifling admixture of loam and sand, should be chosen, and in potting, sufficient drainage must be employed to provide a ready escape for superabundant moisture. And as this is a plant which never rambles or grows large and luxuriant, it must not be planted in too large a pot. Immediately after potting it should be placed in a close frame, and kept shaded from bright sunshine, till the roots have taken hold of the fresh compost. The great difficulty experienced in inducing cuttings to strike root still prevents the plant from becoming common or even generally known. Cuttings must be chosen from the young wood just as it begins to acquire firmness, and they should be planted in sand, the pot plunged in a slight bottom-heat, and covered with a bell-glass. The specific designation is given in compliment to Messrs. Henderson, of Pine-apple place.—*Paxton's Magazine of Botany.*

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—Among the various experiments carried on here, that of steeping seeds has occupied some attention. Seeds of the principal kinds of grain and legumes, viz., Wheat, Barley, Rye, Oats, Beans, and Peas, have been steeped in solutions of nitrate of soda, muriate of lime, sulphate of magnesia, muriate of ammonia, phosphate of ammonia, salt, and water. These are sown in parallel beds, in rows drilled across the beds, and an unsteeped row of each of the above-named grain is sown beside them, in order to ascertain comparatively the effect of the steeps. Judging from present appearances the Wheat, Barley, Rye, and Oats, seem to be little affected by the steeps, but, if anything, some have rather an injurious than a beneficial effect, especially on the Wheat. In the case of Peas, however, all were killed except those steeped in sulphate of magnesia, the unsteeped, and those steeped in water only; the latter are the best. Of Beans, the row that was steeped in water is decidedly the best. In the large stove are seeds of Lupinus Hartwegii, in pots, that were steeped in a solution of phosphate of ammonia. There were 12 pots, in each of which 5 seeds were sown on the 22d of April; those that germinated appeared above the soil about the 25th of the same month. The first sowing was 6 hours in the steep, the second was 12, and so on in progression to the 12th, which was 168 hours, or a week in the steep. Of the 5 seeds sown, the greatest number raised in each pot was 2, and all of them had a sickly appearance; four of the pots produced nothing, including the seeds that were in the steep 168 hours. Other 12 pots were sown with seeds steeped in the same kind of solution, but considerably weaker, all other circumstances being the same as above; and the result in this instance is nearly similar—with this exception, that the 5 seeds which were 6 hours in the steep were healthy. Five seeds, receiving exactly the same treatment with regard to temperature, &c., but not steeped in the solution, are very healthy. The ground manured with artificial manures for Potatoes last season, is this year sown with Barley, without any manure, in order to prove the effect of the substances on a second crop; owing to the long continuation of dry weather, however, there is at present very little difference in any of the beds. The same may be said of the portions sown with Wheat, and manured exactly as last season; where the muriate, sulphate, and phosphate of ammonia were applied, the plants exhibit a darker green foliage than the others. With regard to heating, the cast-iron tanks put up by Burbidge and Healy, in the wooden vinery, have as yet proved satisfactory. During dry weather the circular openings in the covers are left open for the emission of vapour—so essentially necessary to the Vines, in this dry season particularly. The Vines have a healthy broad dark-green foliage. The smoke-flues, converted into hot-water gutters, rendered water-tight by cement, and covered with tiles, answer admirably in summer for almost all plants—the only fault being the emission of too much vapour, for most things, in winter. The Melon-pits lately erected appear to answer well, especially where the iron tanks are covered with porous tiles, made to fit above and lap down the sides. The tiles give out enough of moisture to the soil, and effectually prevent the roots from being injured by contact with the iron. That the plants like their situation is amply proved by their fine, large, dark-green foliage. They were raised from seeds sent by Colonel Stoddart from Bokhara; and by others from Cabul. They appear to be strong-growing, and prolific kinds; they are planted in Norwood loam. In some instances, the surface of this is paved with small stones, which tend to preserve the roots in a more uniform state with regard to heat and moisture during this dry season. In the large stove is a plant of Aristolochia gigas, or Pilate's nightcap, trained along the roof. This is an excellent stove-climber, having been in bloom three or four months, and producing seven or eight of its singularly large concave blossoms at a time. Besides their size and curious form they are not without beauty, from the pretty dark-purple veins that intersect the lip, which has a cream-coloured ground. Around the orifice of the tube the colour is a beautiful, rich, velvety purple, which adds much to the beauty of the flower. In general appearance it somewhat resembles Aristolochia fœtens, but is much larger, and has more the appearance of a cap. When grown in a pot this plant is exceedingly liable to be attacked by red spider, which renders the plant unhealthy, and gives the foliage a bad appearance; but it succeeds well planted out in the border of a large stove, for which, from its extreme luxuriance of growth, it is particularly suitable. It was received from Guatemala a few years ago, but is not yet generally known. In the same house was a Gesnera, very much like G. rutila, that had been sent from Popayan by Mr. Hartweg. In the house that was formerly a Pine-stove, but that has lately been greatly altered and improved, the plants have a very healthy appearance. A large plant of Doryanthes excelsa is throwing up a strong flower-stem, at present about 6 feet high, in the large conservatory; and here, among other plants, was also in bloom a fine bush of Mimulus glutinosus.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—STOVE, CONSERVATORIES, &c.

FOR the next six weeks or two months, according to the weather, stove plants ought to have more air and light than at any other period. After this time, therefore, shade as little as possible with the exception of Orchidaceæ and young or newly-propagated plants. Seeds of those splendid Clerodendrons, which make such fine display at summer Exhibitions, should be sown as early this month as possible; they will flower about this time next year, or earlier; and seedling plants of them are much easier to manage than those from cuttings.

Conservatory.—Climbers in this house—if they are what they should be—will now require the greatest attention; training, thinning, and arranging them properly, occupies a great deal of time, and is one of those jobs that should never be done in a hurry. Formerly it was customary in many places to tie up these close to the pillars and rafters, &c., in a stiff, formal way, but now it is thought they can hardly have too much freedom, providing they do not injure other plants with their shade. Orange-trees, and many large specimen plants, require less water about this time; but diminish the quantity very gradually.

Greenhouse.—If the plants here now are all of the true greenhouse kinds, give them as much air as the house will admit; but if, as is generally the case at this time, they are a mixed collection of half stove plants and annuals, &c., you must keep them close at night, with a very damp atmosphere, and you may let the house get well heated by the sun before you give air in the morning. Training and staking plants, surfacing pots, and all that sort of routine business, you need not be reminded of.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

There is little to attend to in this department at the present time, except cleaning, and keeping everything and every place as neat and tidy as possible. The Grass here, which was dressed with Potter's Guano when the rain fell, though as brown as a gravel-walk, is now as green as could possibly be desired, while other lawns in the neighbourhood are still comparatively quite brown: so much for Potter's Guano. Attend to the removal of flowers as fast as they decay, as nothing looks so untidy in a well-kept garden as dead flowers.

Reserve Garden.—Under this head last week I made a mistake: the last sentence ought to have read as follows:—Brompton Stocks must be sown immediately, but Brompton Ten-week Stocks I never sow before the first week in August. The reader will please to attend to this.

Rosery.—This is delightful weather for budding; and where the buds are properly matured, as they are in most places, it must be attended to immediately. Established plants of Roses, that make very strong branches which hide the flowers, should have them shortened in below the level of the flowers.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Tulips.—These ought now to be all safely stored; those which are seeding on the bed, must occasionally be examined; when the stalk assumes a yellow tint, the roots may be taken up, and the stems, with capsules attached, may be placed in an airy room, till they become perfectly dry. Bulbs which have perfected a head of seed, usually "come out of character" the following season. More Tulip seed will be saved this season than usual; and florists are congratulating themselves on the great increase their bulbs have made, and the prime condition they take up in. *Pinks.*—Plant out the first crop of pipings, if proper attention can be given them; such as shading, watering, &c. If more convenient, wait till the first shower comes. *Carnations.*—I noticed in the *Chronicle* some time ago, a recommendation to mix fresh cow manure with water, for plants; it may suit some well, I doubt not; but I nearly lost a large stock of Carnations two years ago, by watering them with such a mixture. It was just previous to layering, and it appears that the eggs of a species of fly were deposited in the dung; and consequently carried to the surface of the soil in the pots, with the water; the process of layering went on, and in about a week, myriads of small brown grubs with black shining heads were hatched. The work of destruction commenced, scores of pots, full of layers, were destroyed; the layers of those remaining were unpegged, the soil removed, and every precaution taken; but the plague ceased as suddenly as it appeared, in consequence of the pests (to me) assuming their pupa state. They did not attack those which had not been layered. Continue to tie up buds, pinch off laterals, and attend to shading, &c., as the warm weather brings them on rapidly. I have lately given my stock a dose or two of Potter's Liquid Guano with evident benefit to the plants. *Pansies.*—Take advantage of the first showery weather, to put out your young plants.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Examine frequently all plants in pots not plunged over the rim, to see if they require water. Be attentive to giving air, and shade in hot weather. Should any of the fruit show indications of ripening before the soil is in a proper state of dryness, raise the pots out of the tan, to allow them to become dry, and avoid syringing them. Much caution should be exercised not to continue watering too long, as the flavour of the fruit suffers much by the soil being kept too moist when ripening. Pot or plant all strong suckers as soon as taken from the plants. Suckers grow with greatest vigour when planted in flaky or half-decayed leaf-mould over tan; and if those now ready can be so treated, they will, by the end of September, have made great progress, and be fit for potting in 6 or 7 inch pots, in which they will be well-established by the middle of November. Whether planted out or potted they should have a bottom-heat of from 80 to 85°, and be shaded in bright sunshine, till they are well rooted.

Vineries.—Those who have been fortunate in keeping the foliage of their early forced Vines clean and healthy up to this period, will stand the best chance of success next year. Continue to wash the foliage occasionally, and give plenty of air. If the roots are outside, no more watering will be necessary in situations where rain has fallen freely, particularly where mulching is practised, as recommended in former Calendars. Those who, like ourselves, are in a situation somewhat resembling that of Tantalus, and can see and hear of rain falling in abundance all around them, while their own ground is parched up like an African desert, must water away yet. The mulching should be of sufficient thickness to prevent the soil from cracking, but not altogether to prevent the action of the sun and atmosphere on the border, as that is of great benefit to the roots. In the "Answers to Correspondents" last week, it is said that "some of the best gardeners syringe their Vines morning, noon, and night." As this practice is at variance with my own experience, I am now making some further experiments on the subject, which may help to set the matter at rest, and the results of which I will make known.

Peach houses.—Attend to the watering, syringing, and ventilating of the late houses. Houses from which the crop has been gathered should be kept perfectly clean from insects, and the paths and borders in neat order. If the lights are required for other crops they may be removed after the trees have been properly hardened to the air, by leaving the back and front ventilators open night and day for a week or 10 days. I, however, prefer keeping the lights on till the leaves begin to fade, giving the air full scope, and supplying the inside roots with water when necessary.

Fig-house.—Trees planted within the last two or three years will probably be growing too vigorously to bear much fruit. Give them no more water than will secure the fruit they have on from dropping; stop the lateral shoots at every third eye, and keep them thin, in order to let the leaves have sufficient air and light.

Strawberries.—A number of small pots should now be got in readiness in which to lay the runners intended to make plants for forcing next season. Taking care to have plenty of plants is one great step towards having plenty of fruit next spring. Prepare also some loamy soil, moderately enriched with leaf-mould, for potting them in.

Melons.—Pay attention to stopping the laterals and setting the fruit on the successional plants. Keep them very thin, never allowing one leaf to overlap another. Keep up the heat in dung-beds by fresh linings when necessary.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Pear and Apple Trees, &c.—Those who thought proper to attend to the stopping of the shoots of Pear trees, &c. against walls, will be gratified with perceiving the buds swelling beautifully at the points of the small spurs, and at the base of the shoots shortened. Allow the young shoot, started from the foremost bud of the stopped shoot, to grow a little longer, or if getting long, merely pinch out its point, as any sudden check to the flow of the sap, after such genial rains, would be apt to cause those promising buds to break into shoots, which you would rather wish to see adorned with blossom and fruit next season. Whatever opinions we may entertain on disputed points in vegetable morphology, there can be no question that the production of blossom or of leaf buds, will depend mainly on the circumstances in which a plant is situated, and the treatment it receives. It is a general complaint that fine looking old Pear trees against walls produce sparingly, and that chiefly on the points of the branches. This is partly owing to the fact, that the other parts of the tree are so smothered with breastwood during the best part of the summer, that the buds finally left cannot be matured by the juice-elaborating influence of light, and partly is it attributable to the prejudice that exists among the employers of gardeners against seeing their fruit tree borders uncropped, the consequence of which is that the roots are incited to go so deep that they absorb juices of so rank a character, that our longest and best summers are insufficient to ripen the buds on their willow-like shoots. The true remedy for this is to raise the roots nearer the surface (the cutting of the roots a yard or two from the bole of the tree, and filling the trench with rich compost, is working to make work), timely fore-shortening, and slight or no cropping. On some occasions I have witnessed beneficial results produced by taking off the young wood from every alternate branch on old trees, choosing nice shoots, about a foot apart, on the other branches, commencing at the top of the tree, tying these shoots in a pendent position to the denuded branches; taking out these branches in the succeeding year, and then in a year more, other circumstances being favourable, the tree was regularly covered with young fruitful wood.

Vegetable Marrow and Cucumbers under hand lights should have a little long litter spread over the soil, before the shoots are pegged out to their full extent, which will keep the fruit clean, save watering, and bring up the mushrooms quicker where spawn was inserted. Cucumbers in frames will require to have the linings renewed, if we have much dull weather, and seed should be sown, or cuttings struck, and fresh beds made, so as to secure nice crisp fruit, when those on ridges may have become stunted from a cold autumn. In making beds, though much heat will not now be wanted, it will be found a saving of labour, and ultimately of material, to make them large enough at first, as previously recommended.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—As the overgrowth of Briers and other stuff is very injurious to young trees, frequent attention should be paid to keeping their summer growths from being injured.

Coppice.—Presuming that all the produce of this year's cutting is cleared away, and that fences are put in good repair, great care should now be taken to regulate and keep in proper order the young shoots from stools, &c. Train these, for profitable purposes, and prevent them from injuring each other by being too crowded.

Young Plantations.—If landowners would consider the great advantages, as well as profits, that would arise from judicious summer pruning and training of young trees, from the time they are first planted until they shall have reached fifteen or twenty years' growth, the plantations and hedge row trees in this country would have a much more creditable appearance. The neglect of this practice is apparent from the general state of plantations and hedge-row trees at the present day.

Hedge-rows.—Young trees require frequent attention; keep them from being injured by cattle or other causes.

Nursery Work.—In consequence of the long dry weather, the ground, between rows of plants, will require frequent stirring;

water newly transplanted trees, seedlings, and seedbeds of delicate things. There has been little rain here yet.—*W.B.*

VII.—COTTAGERS' CALENDAR.

Where the walls of the cottage are covered with creepers it is necessary to have them trimmed up occasionally during the growing season, in order to keep them neat and within proper limits. Fruit trees, such as Apples, Pears, Plums, and Cherries, the kinds generally grown by cottagers against walls, should now be gone over, and have their leading shoots fastened in, to prevent them from being broken. As these kinds of trees produce their fruit chiefly on spurs formed along the principal branches, it is necessary to shorten the fore right shoots to within a few inches of the branch or spur from which they spring. Summer pruning, however, in every case ought to be performed with care and discretion, and it is better to err on the safe side than to prune too closely, as the shorter the spur there is the greater chance of the buds breaking into shoots in the present season, instead of becoming fruit buds in the following season. Some say prune not at all; but this is not the best advice, for the fruit to be good must itself have light and air, and the fruit spurs become weak when too much shaded by a thicket of shoots. Attend to Potatoes, and see that they are properly earthed up. The cottager should now be on the outlook for plants of the following Broccolies, to be planted about the end of the month, viz., Purple Sprouting, Knight's Protecting, Portsmouth, and Danish; the first is an exceedingly useful Broccoli, as in favourable winters it is in use from the time the autumn sorts are done until the spring varieties come in; the other two kinds are good for spring use; the last may be planted about 15 inches apart, or even perhaps as close as 12—it is small but very hardy, and producing a large quantity of heads for the ground it occupies; it is well suited for the cottager. A small quantity of Cauliflower might now be planted for use in August; where that will not succeed, Grange's Early Cauliflower Broccoli is an excellent substitute, a little of which planted occasionally towards the middle of July will be found useful. Sow a patch of Lettuce seed every fortnight, so that a succession may always be had in the best order. It ought to be sown where it is to stand, and should never be transplanted during hot weather. A small bed of Onions sown now will be useful in autumn.—*J.McH.*

State of the Weather near London for the week ending July 4, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

The Reprint of Mr. PAXTON'S COTTAGERS' CALENDAR will be ready on WEDNESDAY, price 3*d.* each Copy. An Index has been added to this present Edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5*s.*

ARAUCARIA EXCELSA.—*J. G. B.*—This strikes freely from cuttings put into sand about the middle of August. They should be covered with a bell-glass, and placed in a close pit or frame, where there is no bottom-heat. They must remain in this situation (free from frost and damp) until the following spring, when they should have a little bottom-heat to start them. Plants of this, struck from cuttings, however, always retain the fan-like habit of the branches, and they never make a good leader.¶

BOOKS.—*W. Payne.*—For a gardener the Botany of Lindley's "Theory of Horticulture" is what is most essential. Suppose the chapters to be called Lectures, and you have what you want. If you wish to analyse soils, and to go into similar details, consult Johnston's "Agricultural Chemistry." You should apply to the Philosophical Instrument makers, such as Newman, in Regent-street, for catalogues of apparatus.——*E. T. R. F.*—There is a full account of the Botanical productions of Melville Islands, North America, in the Appendix to Parry's "Voyage to the North Pole."

CHISWICK SHOWS.—*T. U.*—All persons can exhibit, and there are no other regulations than those which have been advertised in our columns from time to time.

CUCUMBERS.—*R. C. B.*—Your Cucumbers have more water given them than they can consume, the effect of which is that gum forms in their interior and eventually finds its way through their surface. Perhaps you shade them too much; or they may not have air enough—for we cannot suppose that they are not warm enough in this sort of weather.

GRAFTING.—*Old Subscriber.*—It is doubtless true that when the head of a tree is cut off, and a few scions are inserted upon it, it is hard to suppose that all the juices of the tree, which, in its original condition, would have gone to feed its head, can go to the sustenance of the little twigs which are produced by the scions when they grow; yet it is substantially so. All the branches and buds being removed, nothing else can take place. What happens is, that the organising force of the trunk is directed to those scions, and consumed by them, as far as is in the nature of things practicable; wherefore, in fact, such scions make enormous shoots. But, inasmuch as they can only consume a certain small quantity of the organisable matter, the remainder continues locked up in the interior of the tree, till, in future years, it is wanted. If, upon grafted trees you leave the natural branches, they are apt to attract all the juices to themselves, and so starve the scions, which consequently perish.

HEATING.—*J. P.*—If an iron tank has its sides exposed it will heat the air of a stove and also convey bottom-heat. It is only when tanks are buried in soil that pipes become necessary for air-heating.

HYDRANGEAS.—*A Subscriber.*—If you want to get large bushes of Hydrangeas in the open air, plant them in good rich soil, form a basin of clay all round them six inches deep, and in dry weather fill it with water every evening after they have got fairly into leaf. Towards autumn withhold watering altogether. Get their wood ripe. For winter, stuff straw between their branches, wrap them well in it, and mat them up.

INSECTS.—*J. W. G.*—Your beetle is the Curculio Abietis. *R.*——*H. H.*—We believe the eggs are those of the earth-worm. The black-beetles of London are cockroaches, the former being a very improper name, as they do not belong to the same order of insects as beetles do, but it is extremely difficult to conquer vulgar errors. We intend to make the Cockroaches the subject of a memoir as soon as we have an opportunity. The Poke-root is unknown to us. *R.*——*E. A.*—We must beg of you in future to send your specimens protected in quills, for they were all destroyed. We can give you no advice beyond urging you to repeat the remedies which appeared most beneficial. All that is known regarding the pests you suffer from has been published in the 1st vol. of this Journal, p. 196, and a more elaborate paper will shortly appear in the Journal of the Royal Agricultural Society. *R.*——*Apis's* Insects with luminous tails are male Glow-worms. *R.*——*A. B.'s* Barley is infested with the maggots of a fly called Chlorops; the specific name shall be communicated as soon as the specimens hatch. Mr. Curtis will feel obliged if *A. B.* will favour him with some more specimens directed to 11, Robert-st., Hampstead-road, with any remarks he has to make regarding the time when they were first noticed; and anything that may occur to him during the future growth of the Barley, Mr. C. begs may be forwarded also, as he will be arranging his materials during the autumn relative to the Corn crops, for the Journal of the Royal Agricultural Society.——*A Subscriber.*—For a cure for wireworm, see p. 233, 1843, and p. 777, 1842.

MELONS.—*Susanna.*—Take your Melons before they are ripe, peel them, and cut them into quarters; then throw them into a thin syrup, and boil them gently over a slow fire for two hours; afterwards put them into wide jars. Look at them in a week or ten days, and if they are likely to ferment give them a second boil as before.

MORPHOLOGY.—*J. M., Cheshire.*—Double Heaths are very uncommon. In your case the additional corolla is formed by the change of part of the stamens into petals.

NAMES OF PLANTS.—*Sedum.*—Linaria bipartita, not indigenous.——*O. C.*—Clitoria Ternatea.——*Anon* appears to be a young Epilobium hirsutum.——*X. X. X.*—We do not see how your Gesnera differs from G. faucialis. Flowers ought never to be sent in cotton wool, which dries them up. They should be covered with damp brown paper before they are put into the box for post.——*A Young Botanist.*—No. 1, Arrhenatherum avenaceum, attacked by Uredo segetum (smut); 2, A. avenaceum; 3, Festuca elatior; 4, Avena strigosa; 5, A. flavescens; 6, Hordeum murinum.§——*A Constant Reader.*—Gesnera Suttoni.——*W. R.*—It is impracticable to name seedling plants that have not flowered; or if practicable, it requires more time than we can spare. 3 is some Xanthoxylon. The Corylus is a Viburnum.

PELARGONIUMS.—*Verad.*—Your leaves are certainly very healthy and the plants must be in good condition; but we do not find anything particularly remarkable in them.

POTATOES.—*Villager.*—When Potatoes blossom and the flowers fall off, no fruit succeeding, it is *pro tanto* injurious to the crop to let such flowers follow their own inclinations; they should be nipped in the bud.

QUICK HEDGES.—*Tyro.*—There is a difference of opinion whether Quick should be cut down as soon as planted, or allowed to remain one year before the operation is performed. Like all such questions, circumstances render the one plan better at one time—the other at another. In such a dry season as this, it would have been better to have cut it down upon first planting. A moderate quantity of soft charcoal is evidently advantageous to all plants, if mixed with the soil.

ROSES.—*E. F. L.*—The following are 10 good China Roses:—Cramoisie superieure, Fabvier, Henry the Fifth, Napoleon, Theresa Stravius, Paris, Clara Sylvain, Mrs. Bosanquet, Eugene Beauharnais, and Archduke Charles. Liquid guano may be applied with advantage to Peach-trees.‡

ROYAL BOTANICAL SOCIETY.—*Felix.*—We have no right to publish statements relating to the private affairs of the Society. If you want information apply to the secretary.——*Scrutator.*—Your letter, as it relates to matters of fact, must be verified by your *confidentially* giving your name. We will then publish it, with a little curtailment. We agree with you that exhibitors ought not to be judges.

SNAILS.—*F. H. R.*—A correspondent (p. 737, 1843) states that he has found decaying blooms of Sunflower to be the best trap for snails.‡

STRAWBERRIES.—*G. P.'s* British Queen Strawberry plants, of last autumn's planting out, from the runners then made, have borne a very good crop of fruit, both in size and quantity, but the points of the fruit do not ripen but continue hard; although the bulk of the Strawberry and that part more especially exposed to the sun, is soft and of a good flavour, the points are almost like a core, and of unripe acid taste. The situation is warm, and they have the sun for a considerable portion of the day. We presume the mischief to arise from slow growth, on account of insufficient watering.

SUNKEN PITS.—*Amateur, Reform Club,* suggests that those who are occupied in the formation of horticultural buildings, while they direct their attention to the discovery of all sorts of contrivances for heating and constructing them, have generally overlooked one of considerable importance, namely, the advantage of sinking them below the surface of the soil; and he remarks that, assuming the possibility of *perfect drainage* from the bottom of the building, there would be in sunken pits the advantage of an equable temperature. This is true, and it is partly for this reason, and partly for the sake of economy, that the plan of building sunken pits has been adopted here and there. Certainly, where ground lies high and slopes so as to throw water rapidly off it, the advantages anticipated would be gained; that is to say, such pits could be kept at a more equable temperature than others merely surrounded by thin walls. But there are disadvantages of considerable moment. Sunken pits are inconvenient to get at; there is no pulling their sashes off and on with ease, and ventilation is troublesome. Then again, in spite of all that can be done, they will always be damp; and although this is advantageous for some purposes, it is destructive to greenhouse plants in long winters. Upon the whole, the inconveniences are at least as considerable as the advantages; and we doubt whether sunken pits can often be recommended in gardens.

VINES.—*Hort Suff.*—If, as you say, we state that we see "no good reason against syringing Vines, even morning, noon, and night," without exposing them to any danger, and a correspondent in another part of the Paper says, "Be careful to have the Vines quite dry before the sun comes upon them in the morning, as nothing is so injurious to the leaves as the action of the sun on them when moist," this only shows that it is, as we have told you, a debated question. We hold to our own opinion; and we see that Mr. Roberts, than whom no man has produced finer Grapes, does habitually exactly what we recommend as a help against the Red Spider. *Very bright* light appears to injure newly-moistened Vines; but why?—that is an unexplained fact, if it be a fact.

MISCELLANEOUS.—*X.*—Nothing is more common than the tobacco plant. It is an annual raised from seed, on a hot-bed, and planted out in the open border when the frosts are over.——*R. W.*—The quickest growing hedge to protect a flower garden, much exposed to south-west winds, and on the top of a hill, is Furze; which, if well managed, is substantial and durable.——*A. J. B.*—Your Cauliflower-seed is probably of bad quality. Change your stock. The Fern-leaved Beech is a sport from the common Beech, and, like all sports, is apt to return to its original form, either wholly or in part.——*A Subscriber.*—The irregularity of which you complain must be caused by the folding, as the Paper is regularly paged except the news part, which is left blank for the convenience of parties who wish to omit it in binding. We have nothing to do with the folding, we merely supply the trade in sheets.——*Vigornensis.*—The Volume will not be completed till the 28th Dec.——*T. T. H.*—We have heard nothing more with respect to your Numbers.——*Incog.* will find an answer to his question in last week's Paper, p. 432.‡——*J. E.*—English mercury is a dangerous poison, producing serious vomiting and diarrhœa. It is called Mercurialis, because they say that the God Mercury discovered its uses.——*An Old Subscriber.*—We do not see how we can possibly give you the *detailed* advice that you require. General advice will be of little service in your case. Better apply to Mr. Glendinning, of Turnham Green, who would find time to attend to the details.——*Almus.*—The Rose of Jericho is the Anastatica hierochuntina, of which you will find a full account in a Leading Article in a former No.——*A Subscriber.*—There is nothing deleterious or poisonous in the ripe fruit of Cactus speciosissimus.‡——*A Subscriber.*—You may clip your Box-edgings now; they may be also done with advantage in spring.‡——*Flora.*—For Camellias, mix your guano with cow's urine.‡——*A Subscriber.*—If your seed is good it will grow; but the kinds are apt to be long in coming up. The Alstrœmeria requires bottom-heat; the others would also do better with it, but will succeed without it.‡——*Clericus.*—If your Strawberry plants are young and runners troublesome, they should be removed before they have taken root, which will give the stool plants full possession of the soil. The removal of your Fuchsias from a warm to a colder situation would cause the tops of the shoot to become curled and distorted, or the neglect of sufficiently supplying them with water would produce the same effect. In the former case a little care will soon recover them; in the latter the remedy is apparent.‡——*Clericus.*—We have still a few copies of the *Gardeners' Chronicle,* vol. for 1843; price 29*s.*, cloth.

SEEDLING FLORISTS' FLOWERS.

ANTIRRHINUM.—*W. M.*—We are glad to find this beautiful tribe taken up; it is, no doubt, susceptible of great improvement: we, however, see but two varieties that are new amongst your seedlings, 6 and 5.*

CALCEOLARIAS.—*R. & S.*—Your seedling is a flower of fine form, and the spotting very pretty; but the ground colour not being uniform, is a detriment to the value of the flower.*——*R. S.*—Your seedlings are rich in colour, and would have been welcomed a few years since, but they are small compared to the flowers of the present time; they are, however, of good substance.*——*S. S.*—Spotted specimens are become common; some of your varieties are fine and peculiar; the best are, Nos. 47, 45, 98, 57, 46, 108; 7—47 is particularly fine.*

FUCHSIAS.—*B. B.*—The seedling is a large and very stout flower; the sepals expand, and show the corolla, which is very large and stout, with a slight dash of purple added to the crimson; it is a handsome variety.*——*A Novice.*—Your seedling is a large richly-coloured and very stout flower, crimson tube and sepals, having a stout corolla, with a slight tinge of purple; a good and handsome flower.*

PANSIES.—*J. J. J.*—Neither of your Pansies will suit the present taste; they are deficient in size and substance.*——*J. C.*—No. 1 is very inferior to the dark selfs in cultivation; No. 2 is extremely pretty, from the margin being similar on all the petals; it, however, wants substance and size.*

PETUNIA.—*B. B.*—Your Petunias are large, but they are very inferior to the variegated varieties produced at the present time.*——*W. M.*—*Unique superb* is a remarkably rich and fine-coloured variety. *Exactum,* also, is a fine flower. *Beauty superb* is good also in colour, but this and the other two varieties have the outline too much cut in upon at the divisions of the corolla.*

PELARGONIUMS.—*J. J. J.*—Nos. 1, 4, 5, 6 are flowers bad in form, having petals too long and narrow. 2 and 3 are better in form, but they are common in colour, and too small.*——*J. D. W.*—*Mary Deane* is a very pretty variety; the colours are clear, spot intense, and the pure white centre gives the flower a very lively appearance.*——*R. S.*—Both your seedlings are pretty little specimens; No. 1 is the best; its colours are of a higher quality, and the white throat gives it a superiority over No. 2; they want size.*——*A. R.*—Your seedling is a flower of good form; deep velvety maroon upper petals, with rosy fringed edge, rosy under petals, with a blotch in each; these petals are rather fringed at the edge also, which is the defect in the flower.*——*I. D. P.*—It is impossible to form a correct opinion of a flower sent flat in a letter; the colours are clean, but it appears to want substance very much.*——*J. S. I.*—*Gem.* The colour, form, and substance of this flower are good; it wants a little more width in the lower petals; the upper petals are rich and fine; the colour terminates abruptly at the base, and leaves a narrow margin of rose-colour round the upper part. No. 4 is fine and desirable in colour, of good substance, with an intense spot; the flowers were shaken to pieces, but the lower petals are evidently too long for a finely-formed flower.*——*Dromore.*—We are not acquainted with the name of your flower; its pretensions are very moderate. It is impossible to account for a single flower on a truss coming imperfect.*——*A Berkshire Subscriber.*—The best flower in your collection is No. 6, being of good form and substance; 3 and 7 are common, and too much alike; 2, 5, 4, and 1 are also very moderate; 8 is a mere curiosity.*——*Z. Y. X.*—No. 1 is a seedling of good form, and strong contrast between the colour of the upper and lower petals; its principal defect is the want of substance. 2, common in colour, but fair in form; this flower, we imagine, curls back too much. 3, petals rather too long, and the substance is not carried through to the edge, but this part of the flower is left thin and uneven. 4, a pretty flower, good in form, but thin on the edges of the top petals. 5, top petals too high, and blotched. 6, petals too narrow, and thin. 7, a very pretty variety; margin well defined on the top petals; it appears to be too thin also. There is good promise in these seedlings, but if you compare them with the leading varieties of the present day, you will perceive that there is generally a deficiency of substance, which should be carried out to the margin of the petals.*——*A Novice.*—A bright and very pretty seedling; the lower petals are beautiful in colour and form; the flower, altogether, is small; the white centre gives it a lively appearance.*——*J. S. J.*—Your seedlings are remarkably fine and showy greenhouse varieties, clear and rich in colour, but rather deficient in that compactness of form and clean set of the petals which constitute the first-rate varieties of the present day. No. 1 is a fine clear rose-coloured variety, with white centre; upper petals a little too small for the size of the flower. 2 is also a flower clear and fine in colour, but when fully expanded the flowers do not retain their form; the under petals are too narrow. 3 has the same fault, and is common in colour. 15, good colours, with an inclination in the petals to curl back. 16, not good, either in colour or form; when expanded, the lower petals separate from the upper. 18, very large, and superior in colour, with broad under petals; but when fully open, the petals curl back, and deprive the flower of that compactness of form which it should retain to the last. Have these specimens not been a little overgrown?*

SPANISH PINK.—*A Constant Reader's* seedling Spanish Pink will make a desirable border variety, or for the purpose of bedding out: it is described as a free bloomer, each plant having 12 or 14 stems, and each stem having 18 to 25 blooms; the colour is a rich bright carmine.*

THUNBERGIAS.—*J. Fryer.*—If your seedlings, called alata superba and aurantiaca superba retain their increased size, they are certainly a great improvement.

VERBENAS.—*W. W.*—*Hudsonii* is a good variety, bright rosy purple, with a white eye, distinct in colour.*——*I. S. I.*—Your seedling is a fine dark variety, of a rich, velvety, crimson maroon colour; the flowers are large and expand well: it is one of the best dark-coloured varieties we have seen.*

YORKSHIRE LAND-DRAINING ASSOCIATION.—At a MEETING of the PROVISIONAL COMMITTEE held at YORK, this day, for the purpose of Allotting the Shares applied for in the Association, and on other business—

It was resolved, that the number of Shares now allotted being amply sufficient to justify the Committee in proceeding forthwith to carry out the objects of the Association, the necessary Deed of Settlement be prepared for execution. And that such of the Public as may yet be desirous of becoming Shareholders, and shall signify the same to the Solicitors, (Messrs. BLANCHARD, RICHARDSON, and GUTCH, York), or to the Secretary, (Mr. CHARNOCK, Wakefield), on or before the 31st of July next, shall be admitted (if the number of unallotted Shares be sufficient) on the same terms as the present Subscribers.

York, June 12, 1844. JAMES HAMERTON, Chairman.

The Agricultural Gazette.

SATURDAY, JULY 6, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July 10 Agricultural Society of England.
THURSDAY, July 11 Agricultural Imp. Soc. of Ireland.

WEDNESDAY, July 17 Agricultural Society of England.
THURSDAY, July 18 Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.—July 9, Abergavenny.

IN a Lecture explanatory of the CONDITION OF SOIL most favourable to the germination of seed, delivered last year before the Highland and Agricultural Society by Dr. Madden of Penicuik, figures were used as illustrations, of which those below are wood-cuts.

Fig. 1.

Fig. 2.

They are intended to represent highly-magnified sections of specimens of soil in three different conditions. Under the microscope soil is seen to be made up of numerous distinct porous particles. Fig. 1 represents it in a perfectly dry state; both the particles and the channels between them are dry. Fig. 2, on the other hand, represents a soil perfectly wet; the particles themselves are full of water, and so are the channels between them. Now, as both air and moisture are needed to enable the germination of seed, neither of the above conditions are favourable to that process; in the one of the cases air is wanting, and in the other there is no water. The state of soil in which both are present obtains when, as is represented in Fig. 3, the particles themselves are moist, while the passages between them are filled with air.

Fig. 3.

Now, this condition of soil, which is favourable to the germination of seed, is just that under which the vigour of the plant growing on it would also be greatest. The material placed there by the farmer as vegetable food—farm-yard manure—requires to undergo a putrefactive process, before much of it can be available for the nourishment of the crop; and this process cannot take place in the absence of air. In a soil full of stagnant water no air can enter; and this is one of the many reasons why such land is so unproductive, and why there is such a difference between lands otherwise similar, the one being drained naturally or artificially, and the other undrained.

There are, of course, many other circumstances, dependent upon the effects of stagnant water, by which the immense improvement consequent upon the drainage of land may be accounted for—some of them were stated in a Lecture lately delivered at the Royal Institution, which was reported in this Paper;—but its tendency to promote a circulation of fresh air through the soil is certainly one of its greatest advantages. And while drainage is a security against land ever acquiring the condition represented in Fig. 2, it is also, though not so obviously, a security against the soil ever becoming thoroughly dry. Many a well-drained field has afforded a practical proof of this during the present season—the crops on them have not been so much injured by the dry weather as those on undrained land, of an otherwise similar quality, in their neighbourhood; and this fact is explained by the consideration that a finely-pulverised soil is very retentive of moisture. The dryness produced by drainage not only enables the farmer to bring his soil to a finer tilth on the surface, but by the use of the subsoil plough, which, indeed, ought to be considered as a draining-tool, it enables him to preserve this tilth to a depth which was before impracticable. The plants have thus stores of moisture laid up for them at a depth where the sun has no influence, on which they can draw in a dry season, while those on an undrained soil are parched for want of rain. Drainage, in fact, tends to preserve land constantly in the condition represented in Fig. 3; while, where it is needed, the state of the land fluctuates according to the weather between those represented in Figs. 1 and 2. Thus, comparatively speaking, drained land is dry in winter and moist in summer. On this subject, in the last Number of the *Ayrshire Agriculturist*, there is an excellent letter from an anonymous correspondent, from which we shall make a few extracts. He says—"It is a very mistaken notion to suppose that the only object of draining is to dry the land, and that land can be made *too dry* by draining. It is imagined that water is an *evil* to be got rid of. It is only an evil when we do not make a proper use of it, and the more effectually the land is drained, the more moisture will be obtained when most required, during drought. This fact has been beautifully exemplified during the late protracted drought. The undrained, impervious soils have everywhere been baked like brick earth, showing, when in Grain crops, a yellow, sickly, stunted blade; and when in Grass, nothing but bleached windle-straws. Whereas, on well-drained land, the crops have shown a dark-green, luxuriant blade, and the pastures covered with a close sole of white clover, while the fallows turned up full of moisture." Again he says, with reference "to the majority of the land in Ayrshire, and over the greater part of Scotland, which is so stiff and impervious as not to admit the rain that falls from the heavens more than a few inches into the upper soil, where it sours the vegetation, being aided by the poaching of the cattle when in pasture, which form little pools and do incalculable injury; in winter this land is never dry, but is always in a complete puddle to the depth that the plough enters. In heavy rains, all the best of the soil is washed away by the open furrows into the nearest rivers. In time of drought the water upon the surface is soon evaporated by the sun and wind, the land cracks into wide fissures, and the whole herbage is withered down to the roots. On the other hand, when this land is drained to a proper depth (two and a half to three feet), pulverised effectually, and a good dressing of hot lime incorporated with it, the water that falls penetrates through the subsoil into the drains; a proper supply of moisture is thereby constantly kept up throughout the pores of the soil, while the surplus is discharged by the drains, so that in winter it is never too wet, and in summer it is never too dry. In this state the land does not crack, as the moisture prevents it from contracting. In the undrained land there is a constant evaporation from the surface, chilling and destroying vegetation, whereas on the drained, there is a current of warm air passing *downwards*."

In drained land the system of cracks is all below ground, and there they are a benefit instead of an injury, for in clay land the efficiency of drains is greatly increased by them. It is upon this that Mr. Smith, of Deanston, rests his explanation of the fact that drains in very stiff clays often, apparently, do not commence to act efficiently till after the lapse of years. He tells us that during this period the cracks commencing at each of the drains, as under their influence the subsoil in their immediate neighbourhood gets drier, have been extending, until the whole subsoil is dried by them, and then the surface feels the influence of the network system of drainage below it.

Mr. Stirling, of Glenbervie, another distinguished Stirlingshire agriculturist, again, thinks that the delay apparent in the action of drains in stiff clays, is owing to the rain-water very slowly carrying down lime and manure to the subsoil, and thereby rendering it richer and more friable. He states that he has proof that a large portion of the soluble parts of the manure applied on the surface, is often carried away by the water of drains. This gentleman proposes a plan for expediting the action of drains at the ordinary interval in clay land, which is a very simple one, and in many situations may be easily and cheaply carried out. He states that where the surface of the soil is furrowed an inch or two deep in spring "it will crack to a depth and width in proportion to the contractability of the soil, when freed of its superfluous moisture by the summer drought, and that the crack will follow the line so marked. This might be done with a common plough without a mould, and a narrow sock, the feather being set high. The lines being drawn across the drains, if the cracks when formed were filled with *dry* sand, it would form a permanent filter towards the drain, at a small expense."

SKETCHES OF EAST LOTHIAN HUSBANDRY.

IMPLEMENTS.—As imperfect work is a necessary consequence of defective implements, it will be found, when agricultural operations are skilfully executed, much attention is invariably bestowed upon the construction of the implements and machines employed, and in adapting them to the particular soils and circumstances in which they may be used. There is, perhaps, no county in the kingdom better provided with implements and machines for executing and economising rural labour than East Lothian; and to this circumstance, in a great measure, may be ascribed the acknowledged excellence of its tillage farming.

The principal implements used in this county may with propriety be classed under the following heads:—1, tillage implements; 2, sowing machines; 3, hoeing implements; 4, barn machines; and 5, wheel carriages or carts. In a brief sketch like the present, it is quite impossible to present anything like a minutely detailed description of all the implements included under these heads; and my observations will, therefore, be chiefly restricted to a few of the most important in general use on every considerable farm here.

1. TILLAGE IMPLEMENTS.—*Ploughs.*—Until a very recent period, ploughs having wood for the beam and handles, cast-iron for the side-plates, sole-plate, and mould-board, and malleable iron for the coulter, share and bridle, were the only ones in general use throughout the shire; but although not yet entirely displaced by the improved iron swing-plough, they are now rarely to be seen except on some of the upland farms. Men who had long ploughed with these wooden ploughs invariably agree in telling me that they preferred them to the iron ones now employed, and that they made fully as good work with the old as with the new plough. What is called the Currie-plough, although not manufactured in the county, is preferred by some farmers to any of those, for ploughing lea, and all light soils. The increased draught requisite for drawing this plough is its principal fault. Carrick's plough, which is amongst the steadiest going ones, is furnished with an iron rod, connecting the bridle and that part of the beam into which the coulter is inserted. This is what is termed a chain-bridle, and its object is to diminish the draught. The only material improvements effected in the construction of the East Lothian ploughs, during the last few years, consist in lengthening the handles, and in some slight alterations in the shape of the mould-board. Small light ploughs, drawn by one horse, are much used in paring the sides of Bean and Potato drills, preparatory to horse-hoeing, and in ribbing land to be sown with Wheat; when ribbing, or moulding up drills, a spare mould-board is attached, which converts it into a double-mould plough. Price of iron plough, fully mounted, 3*l.* 10*s.* to 4*l.*

Harrows.—The only description of harrows employed here is the common angular one, made either of wood or iron. The iron harrow is preferred on heavy soils, and is coming into general use. Small wooden harrows, with short teeth, are used in covering in Grass-seeds, every farm having at least one pair. A truck or framework of wood, on three low wheels, is employed on almost every farm, for the purpose of conveying harrows to a distance or along roads. Price of iron harrows, with draught trees, 3*l.* to 3*l.* 10*s.*

Rollers.—The rollers chiefly employed are made either of cast-iron or wood. Stone rollers of small diameter, are, however, still used in some farms. The usual length of the cast-iron roller is 6 feet, divided into two segments; and its diameter 22 inches. It is always drawn by two horses, one before the other. The price varies, according to the size, from 8*l.* to 11*l.*, with frame.

Grubbers.—The grubber is here considered to be second only to the plough in point of importance and utility to the tillage farmer. Finlayson's harrow has been found of the greatest advantage in Turnip culture on stiff soils, being well adapted for loosening the soil to a considerable depth, and for dragging up root weeds from beneath the surface; and as doing so effectually has in many cases superseded the necessity of many ploughings. But notwithstanding the celebrity and efficiency of Finlayson's harrow, it is now, on account of its many apparent defects, almost entirely superseded by other grubbers, constructed upon similar principles, but posessing the advantages of which it is deficient. The principal imperfections in Finlayson's harrow are, 1. Its weight and dimensions. 2. The absence of any means whereby the coulters may be lifted wholly out of the ground; and, 3. The inconveniently large intervals between the openings in the spring by which the depth is regulated. These are rectified by the instruments manufactured by Kirkwood of Tranent, and Scouler of Haddington, both of which are allowed to be amongst the most perfect and efficient grubbers anywhere made. Kirkwood's implement differs essentially in its construction, and in the shape of the coulters, from Finlayson's. It is drawn by two, three, or four horses, according to the nature of the soil and the depth to which it may be required to work: it rests on three wheels, and has seven coulters, so adjusted as to move at equal distances from one another, and will work to any required depth of soil. The handles when moved act as levers, of which the fulcrum is the axle of the hindmost wheels. An elevation or depression of the handles elevates or depresses the whole frame-work, and consequently causes the coulters to move at any required depth in the ground, or disengages them altogether, which prevents danger to the coulters when turning at the land-ends, or when encountering rocks or other obstacles in the ground. The coulters cover a space of 4 feet 4 inches in width; they are 14½ inches long, 2 inches broad, and about ¾ of an inch thick. The diameter of the hindmost wheels is 22 inches, and the weight of the whole grubber is about 4 cwt. Scouler's grubber is constructed upon the same general principles as Finlayson's, but it is much smaller and lighter, and has, like Kirkwood's, the advantage of a very simple apparatus, by means of which the depth is regulated, and the coulters readily disengaged from the soil when necessary. Scouler's two-horse grubber, the only

one generally used here, covers a space of about two feet nine inches, has five coulters, each 23 inches long. The diameter of the hindmost wheels is 22 inches. The principal improvements lately effected here in the construction of the grubbers, consists in strengthening the whole machine, adding stays to the coulters and increasing the height of the wheels. Price of grubbers, 6*l.* to 6*l.* 10*s.*

2. SOWING MACHINES.—Under this head are included machines for sowing the seeds of Turnips, Beans, and Peas, Carrots and Corn in drills; also a machine for sowing Corn and Grass seeds broadcast; most of these are now well known. The machine for sowing Corn in drills or rows is now but seldom used, except on light mossy or sandy soils, where a sufficient cover for the seed cannot be had by the operation of the harrows, or in some foul land; the distance between the rows allowing the ground to be worked, and the weeds destroyed, by the hand-hoe—or horse-shoe of a peculiar construction—now rarely employed. The rows are invariably made across the ridges; the machine sows from six to ten rows at a time, according to its size, and is drawn by one horse. The Oat is the only Corn crop generally sown in rows. A machine very extensively employed in this county is that for sowing Corn and Grass seeds broadcast. Its great recommendations are, the regularity with which it distributes the seed, the saving thereby effected, and in remedying the inconvenience and loss of seed arising from sowing with the hand during high winds. The machine consists of an oblong box, 18 to 19 feet in length, supported upon a frame-work on three wheels. A revolving horizontal spindle, with pinions in the inside of the box, scatters the seed; when working, the box extends over half the space of each adjoining ridge, the horse walking in the furrow. Clover and Grass seeds are now rarely sown by the hand, this machine being peculiarly adapted for sowing such small seeds, and obviating the difficulty always experienced in distributing with regularity the small allowance usually given per acre, especially during winds, when, from the lightness of the seeds, they are liable to be blown away.—*T. Sullivan.*

ON LIQUID MANURE.

IN former Papers on Black Horse-ponds, we have shown the large amount of highly fertilising ingredients annually lost to those farmers who allow the urine of their cattle to run to waste. Let us suppose some have determined to collect and preserve it in tanks or otherwise, and to avail themselves of its advantages. The object of the present paper is to point out how this can be best and most economically accomplished, as far as the volatile ingredient ammonia is concerned, passing in review the different modes which have been recommended, and their respective merits and cost.

We have seen that the urine of man and our domestic animals contains a substance called urea, which, when pure, may be preserved for a considerable length of time without change, but which, under favourable circumstances, undergoes a true fermentation, and is converted into carbonate of ammonia. The mode by which this change is brought about is thus described by M. Dumas, in his "Chemical and Physiological Balance of Organic Nature:"—"In the urine, Nature has placed, side by side with the urea, traces of an albuminous or mucous substance, so slight that they almost escape detection by analysis. Nevertheless, this infinitely minute quantity of matter undergoes a change when it comes into contact with the air, becomes one of those ferments which are found distributed over the whole of organic nature, and determines the conversion of the urea into ordinary ammonia." The carbonate of ammonia thus generated, is very soluble in water, and it is also very volatile, constantly tending to assume the gaseous form and to escape into the atmosphere. Water absorbs ammonia, readily taking it up at ordinary temperatures: hence the ammonia lately discovered by Liebig in rain-water and dews. Volcanoes, and even crevices in volcanic soils, give off into the atmosphere ammoniacal gas in abundance; so do all animal, and some vegetable substances, during putrefaction. Thus given off, it is absorbed and dissolved by the descending shower, and again brought down to the earth—again escaping, again to be returned, until it is seized upon by the roots of plants and appropriated in their texture. Much of the value of all manure depends on the proportion of this volatile ingredient that it contains, and it ought to be the object of the farmer to secure for his crops as much of it as he can. In Holland and Flanders the use of liquid manure is well understood, and duly appreciated. "It is chiefly by its peculiar and extraordinary fertilising powers, that the industry of the Fleming is described as having brought so much of the originally sandy and sterile tracts of his country into a state of garden cultivation. The Heath and Broom, which grow on the poorest soils, are encouraged, till their roots bind the loose and white sands together. These being cut, small patches of diminutive Clover are induced, or a few patches of Potatoes are planted, when a cow is kept. The urine is collected carefully in a small tank, or perhaps a cask sunk in the earth; and this is the nucleus from which, in a few years, a little farm will spread around."

Solid dung is comparatively inert. It contains much less ammonia, and ferments with much less activity; and, until moistened, and partially decomposed, acts with much less vigour on the plant. It is by the rapid effect on vegetation produced by the ammonia in liquid manure, that the bulk of roots, and of vegetable matter, are so increased, even in these poor sands, that they are ultimately converted into a soil, not only rich in itself, but by its improved condition capable of absorbing and retaining the moisture necessary to the plant, and with the moisture, the fresh supplies of ammonia which it brings with it. Now, the great blunder of many practical farmers in this country is, as I have endeavoured to show in my former papers on Black Horse-ponds, that they pay little or no attention to the preservation of the urine of their cattle. It is true they make great heaps of solid dung by the road-side, or in their fields, and think they have laid in a large stock of fertility, while they are so totally careless of the liquid and much more valuable portions of the animal excrement, that most of it is lost. There is no doubt but that there is considerable difficulty in preventing this loss, especially of that part which passes off by evaporation. Let us now consider the best methods which practice or science have suggested, of checking this evaporation, *i. e.*, technically, of fixing the ammonia.

The Flemish farmers are in the habit of mixing water with the urine before fermentation; this addition of water retains much of the ammonia in solution. Thus, on referring to the analysis of Sprengel, we find that when cows' urine was allowed to ferment alone for one month, 100,000 lbs. of it was found to contain 205 lbs. of ammonia; but when an equal quantity of water was added previously to fermentation, he found the liquid to contain 1622 lbs. of ammonia: this quantity, although large when compared with that retained by the undiluted urine, is not all the ammonia the urea had yielded by its decomposition, nearly 300 lbs. having escaped into the atmosphere in a gaseous form. Another disadvantage arising from the use of water to retain the ammonia, is the loss of another portion of the ammonia by volatilisation from the surface of the soil, after the application of the liquid manure, more particularly if it be applied in dry and warm weather. The expense of its application also must be greater where the ammonia is retained by water, than where it is fixed by an acid, since at least double the quantity must be conveyed on the land to produce the same effects.

Sulphate of Iron (green vitriol or copperas) is frequently used in Flanders and Holland for the purpose of converting the carbonate of ammonia of the urine into a sulphate. When sulphate of iron is added to fermented urine, the sulphuric acid, which, in the sulphate, is in combination with oxide of iron, quits the iron and combines with the ammonia of the urine, forming sulphate of ammonia, a soluble but not a volatile salt; while the iron and the carbonic acid, the latter of which was in combination with the ammonia, combine together, forming a carbonate of iron, which is insoluble and falls to the bottom of the vessel. In using sulphate of iron the formation of sulphate of ammonia is complete, provided sufficient sulphate of iron has been added to the urine: the sulphate of ammonia being a fixed salt, remains in solution, and may be thus kept for any length of time without loss. This mode of fixing the ammonia is subject to the disadvantage of leaving a sediment of carbonate of iron in the tank; which, in time, would collect to a considerable amount. If more sulphate of iron be added to the urine than sufficient to fix the ammonia, by converting it into a sulphate, it might act injuriously on vegetation in soils devoid of lime.—*Alfred Gyde, Painswick.* *(To be continued.)*

ON MINERAL AND INORGANIC MANURES.

No. XXI.

BY PROFESSOR CHARLES SPRENGEL.

(Continued from p. 435.)

Clay and loam may be roasted immediately on their being dug out of the ground; still, the operation will succeed better if they have become somewhat dry. It may be as well to observe, that roasting should be done in the dryest and hottest season.

At times, clay or loam fit for roasting may be found in the subsoil of the field, in which case much carriage will be saved, and the ovens should be erected close at hand. It is calculated that two men can roast daily from 500 to 600 cubic feet, for which, however, two ovens will be required, of which one will be in operation whilst the other is cooling. By roasting in ovens, some fuel is saved; but the produce of roasting in heaps yields better manure, as it will be mixed with the ashes of a greater amount of fuel. It is the soil on which the loam or clay is to be used, which has to decide the duration and the degree of heating. A stiff clayey soil has not only to be manured, but also loosened by the burnt loam or clay, on which account they are to be burnt for that purpose till they have become hard, as they will then keep the soil loose like sand; still, the burning is not to be continued too long, else the whole protoxide of iron would be re-converted into an oxide, which would cause no ammonia at all to be afterwards formed. It will not be too much for a clayey soil to use 100,000 lbs. of the burnt material on one Magdeburg acre of land; and if these contain, as is not rarely the case, 2000 lbs. protoxide of iron, 200 lbs. of ammonia can be successfully formed. Generally, however, not so much is used, as burnt clay is not a cheap manure. Clayey soils are at times also manured with the dust of burnt bricks; in this case, however, no ammonia can be formed, as this contains no protoxide of iron or manganese. Sandy soils, on the other hand, require a slightly roasted clay, because, as it is necessary to improve it physically as well as chemically, a strongly burnt clay would be of little avail, as it does not possess much power of retaining moisture, and cannot become well mixed with the soil. A slightly burnt clay is a better manure than one much burnt, as it contains always more protoxide of iron and manganese, besides silicates which not having been vitrified by the heat, are easier decomposed by humic acid. It is also to be considered, that a slight roasting of clay will require much less fuel than the burning. The quantity required will be always greater than that of a clayey soil, provided that the texture of the former, as well as its composition, requires to be improved. If it is, however, merely considered as a manure, the quantity to be used will depend on its chemical ingredients. Loamy soils require the least quantity of roasted clay, as they do not need to be physically improved, but merely to receive some manuring substances. For this sort of soil, therefore, 20,000 lbs., and often even less, will be sufficient; nay, some affirm that they have produced an effect by merely applying to this sort of soil twelve times the bulk of the seed-corn: the clay used, however, in this case might be marl.

It is difficult to say how long burnt clay will act as a manure, as this depends on the quantity used, on the chemical properties of the clay, as well as those of the soil. The formation of ammonia decreases in measure as the protoxide of iron and manganese are converted into oxides, and the effect of the silicates will cease, when their bases have passed, by means of the humic acid, into the plants. Even the effects of strongly burnt clay, as a means of loosening the soil, cease finally, as it gradually assumes an earthy consistency, or becomes dissolved. Sandy soils, on the other hand, will become permanently improved by slightly roasted clay. In the first year of application, it chiefly advances the growth of the cerealia, which is easily to be explained, by their receiving nitrogen through the roots, as they absorb the ammonia which is formed with the oxide of iron and manganese.

If only small quantities of roasted clay or loam are used, they are strewed over the field, and harrowed in with the seed; larger quantities are to be ploughed under, which, however, must be done very shallow, as the nitrogen of the air (indispensable for the formation of ammonia,) must always have free access. Before it is ploughed in, it is best to break it still more to pieces with both harrow and roller, because if the humic acid is to decompose the silicates, it is necessary to come into close contact with them. At times fields are manured simultaneously with roasted clay and lime, but this practice appears to me advantageous only when the soil contains much free humic acid, as otherwise the lime will expel the ammonia. The humate of ammonia which is formed, can only subsist along with lime, when the latter finds sufficient humic acid to combine with.

BRITISH OAK.

IN a book entitled the "Library of Useful and Entertaining Knowledge," in the volume which treats of timber-trees, it is said, "The Oak is the father of ships,"—the knotty Oak of England—the unwedgeable and gnarled Oak, as Shakspeare called it; in these two words describing its leading properties." Now it is evident to me that this term will only apply to Q. sessiliflora, which is more full of knots, from its habit and manner of growth, than Q. pedunculata, and which is the only kind that cannot be riven with wedges. In the same book, it is, however, added that "A writer in the 'Quarterly Review' (Sir Walter Scott) ascribes the dry rot in the Navy to the substitution of a *foreign species of Oak* in our own plantations, instead of the true native Oak." The author then goes on to acquaint his readers with what he calls "a fact long known to botanists, but of which our planters and purveyors of timber for the Navy appear to have had no suspicion," that there are two distinct species of Oaks in England—the Quercus robur, and Quercus sessiliflora, the former of which affords a close-grained, firm, solid timber, rarely subject to rot. The other more loose and sappy, very liable to rot, and not half so durable. Here the term Q. robur is applied, after the example of the late Sir James Edward Smith, to Q. pedunculata, to which the name best belongs, if the strength (robor) of the timber is considered; for according to the experience of practical men, Q. sessiliflora is the most close-grained, firm, and solid timber by far of the two. Probably Q. pedunculata, or what is here termed Q. robur, may be the best for particular parts of ships, where weight or stress is required, as from its manner of growth it is more free from knots than the "unwedgeable gnarled Oak," which without doubt is Q. sessiliflora. Thus the one may be more proper for supporting a great weight and resisting a strain; and the other, Q. sessiliflora, for not splintering by a cannon-shot, for uprights, thick planks, boards, &c. where no particular stress is laid. I say probably, for according to Mr. Atkinson, as quoted by Jael, the sessiliflora requires a greater weight to break it than the other. As to its being in solidity, firmness, and durability superior to Q. pedunculata, if cut at a proper age, I think there cannot be the least doubt, from what has been stated on former occasions; therefore they are both valuable for particular purposes.

In the same volume it is further stated that "Q. sessiliflora is supposed to have been introduced some two or three ages ago, from the Continent, where the Oaks are chiefly of the latter species, especially in the German forests, the timber of which is known to be very worthless: but what is of more importance to us is, *de facto*, the imposture abounds and is propagated vigorously in the New Forest and other parts of Hampshire, in Norfolk and the northern counties, also about London; and there is too much reason to believe that the numerous complaints that were heard about our ships being infested with what was called improperly enough the dry-rot were owing to the introduction of this species of Oak into the naval dockyards, where, we understand, the distinction was not even suspected." How any writer or book-maker could pen such a passage as this is, to me, inconceivable.

Q. sessiliflora, introduced "some two or three ages ago!" Why, the most ancient Oak timber in the country, the beams of old castles, the doors of old churches, the roof of Westminster Hall, the submarine forest at Hastings, and the Oak logs taken from the mosses in Scotland, are all of that species. I have myself seen very large Oaks of the sessiliflora in the Forest of Dean and in natural Oak woods on the banks of the Derwent.

As a further specimen of the quality of the information conveyed to the public in this book of the Society for the Diffusion of Useful Knowledge, the following may be taken:—"Of the various European Oaks, the Q. pedunculata is most esteemed on the Continent; it is a magnificent tree, considerably taller than our native Oak. In the forests of Fontainebleau and Compeigne there are at this time many trees of this species, the trunks of which measure from 30 to 36 feet in circumference at the base, and rise to the height of 40 feet without a single branch. Beautiful as this species is, it produces timber very inferior to our Quercus robur—(this may arise from climate, local situation, and growing close together). It is probable that this species, which is indifferently designated by the French Botanists as Q. robur and Q. sessiliflora, is a species entirely different from our real English Oak, for the wood of the Q. pedunculata is described by those writers as harder and more compact than that of the Q. robur or sessiliflora."

The confusion and contradiction observable in the foregoing remarks is most extraordinary. The Q. pedunculata of the French is the same as the Q. pedunculata of the English; and their Q. sessiliflora is also the same species as ours: so that Q. pedunculata is in one place cried up by this writer as the true "heart of Oak" under the name of Q. robur; and then, under its other name of Q. pedunculata, it is supposed to be something else, and of bad quality. As to the concluding part of the sentence, it is wholly unintelligible. Such are the errors of writers who, having no practical or systematical knowledge of the subject on which they write, are nevertheless allowed to lead people wrong most seriously, not only in matters of opinion, but in practice.—*W. Billington.* [The above is the substance of a communication, which, in its original state, was much too long for our columns.]

ON FEEDING CATTLE IN HOUSES OR IN OPEN SHEDS.

(*Continued from page* 434.)

The functions fulfilled by the various ingredients of the food of the domestic animals, will have been seen from the foregoing imperfect sketch:—The importance of supplying matters rich in nitrogen is apparent, for without it no increase of muscular fibre can take place. Highly carbonised ingredients will, however, be seen to be no less essential, otherwise respiration will take place at the expense of the transformation of existing tissues, and in a proportionate degree with loss of condition in the animal.

The quantity of food required by carnivorous, when compared with that used by graminivorous animals, is small. The food of the former class is highly nutritive when compared with that of the latter, in addition to which, the skin of carnivorous animals is destitute of perspiratory pores, so that, in them, no consumption of food is necessary to supply waste from perspiration. Graminivorous animals, especially the ruminantia, continue eating throughout the day with little intermission, as they possess, in a greater degree, the power of converting into organised tissues the excess of food which they consume beyond what is required for supplying the waste which is constantly going forward. They therefore become plump and acquire flesh, while the carnivorous animal continues spare, its flesh being tough and sinewy. The accumulation of flesh in the latter, indeed, would be fatal to their existence, as rendering them incapable of pursuing their prey.

The conditions under which flesh and fat can be accumulated will now be understood. The extent to which this property is developed in many of the breeds of cattle in this country is truly astonishing. In the case of the stall-fed animal, deprived of all means of exercise, and preserved in an atmosphere not subject to vicissitudes of temperature, the waste of the system is inconsiderable, as compared with what it would be in the event of exercise being taken; and the consumption of nitrogenised food is accordingly greater than is required to supply the waste going forward, so that the excess here must be devoted to the production of an increase of muscular fibre or flesh. But the preservation of a high temperature and the want of exercise have also been seen to be equivalent to a diminished supply of oxygen, so that, in the circumstances under consideration, a portion of the carbon which would otherwise be consumed in respiration, will be appropriated to the production of fat, of which, it has been already stated, nitrogen is not a constituent. The proportion, too, in which either flesh or fat will be produced, can in some degree be regulated by the food, that abounding in starch, sugar, or gum, being calculated chiefly for the production of fat alone.

The foregoing sketch presents merely a brief and meagre outline of the phenomena of the process of nutrition in graminivorous animals, to which, for obvious reasons, it has been chiefly confined. Although the successful elucidation of most of these phenomena is not altogether of recent date, yet it is believed that in this department the credit due to Liebig is perhaps equal to what can be claimed for any of his predecessors. The recent work of that learned professor on the subject affords a striking earnest of what may be expected from chemical science in the interesting and important department of which it treats.

Seeing, then, the connexion existing between the accumulation of flesh and fat in the domestic animal, and certain conditions as regards temperature and exercise, it is believed that the foregoing considerations are of much value in determining the relative advantages of the different methods by which the required conditions are sought to be obtained. Stall-feeding cattle is not a practice of recent introduction, nor can it be said that science has had much to do with its adoption. It has been for a length of time losing ground in certain districts, while in others it is almost entirely abandoned, and feeding in open yards, with shelter sheds, substituted, although it would appear that the propriety of the change may be gravely questioned—nay, that the practice abandoned is that which is still to be preferred. Perseverance in an erroneous practice is no new thing among an agricultural population; their disinclination to change is proverbial; but in this age of agricultural improvement it seems not a little difficult to account for the substitution of erroneous practice in the room of that which would appear to be in exact accordance with the investigations of science. But it is believed that although the practice was right, the manner of carrying it into execution may frequently have been so defective that it was rather a matter of surprise that any progress should have been made towards effecting the object in view, than that it should not have come up to the expectations of the feeder.

That the arrangements for the maintenance of the domestic animals should be such as to conduce to their comfort as much as possible is not less enjoined by the dictates of humanity than by self-interest, as, when suffering from any cause, that proficiency either in growth or fatness cannot be made, which it is so much the interest of the feeder to secure. When the animals are confined, either for the whole or the greater part of their time, the evils of even trifling inconveniences are much increased. It is no unusual thing to see stall-fed animals coming to the butcher having their knees covered by a mass of cartilage, sometimes of enormous size, caused by resting on a hard pavement. The pain endured by the unfortunate animal, in the first instance, before Nature interposed this covering for his protection, must have been great indeed. Another arrangement, frequently adopted with a view of preventing choking while feeding on Turnips, is to shorten the neck-chain by which the animal is tied, so that he cannot raise his head more than a few inches from the ground. As animals being stall-fed are seldom standing, only when taking their food, it might be supposed that tying them down in this manner could not be productive of much inconvenience; but so injurious does it often prove, that the animals may frequently be seen with the chains sunk in the backs of their necks, from their constant pressure. Deficient ventilation and want of cleanliness are also frequently characteristic of such apartments, than which nothing can be more inimical to the progress of the animals. In those districts, therefore, where the practice of stall-feeding is losing ground in the estimation of the farmers, it would be well if they made strict inquiry to ascertain that their arrangements were such as a rational and enlightened view of the animal economy would dictate.

After having seen the importance of warmth, as facilitating the object of the feeder, it may appear an anomaly to insist on ventilation; but it must be recollected that deficient ventilation is not always followed by an increase of temperature, and that the latter can be maintained with the greatest facility when the arrangements for ventilation are the most perfect. Deficient ventilation cannot be long in operation without seriously affecting the health of the animals; and it is mistaken policy to suppose that when this is the case the object of the feeder can be promoted.

The breeder and feeder of live-stock should not lose sight of the important fact that the circumstances affecting the growth and fattening of the domestic animals are widely different. The grand object is, of course, to produce the greatest effect by the smallest possible expenditure of means, whether the object be rapid growth, by which early maturity is secured, or the speedy accumulation of fat. A total want of exercise for any considerable length of time, especially in the case of growing animals, is believed to be inimical to the preservation of perfect health; but this is different from the short period of confinement to which they are subjected while being fattened off for the butcher. A certain degree of confinement may, it is conceived, be advantageously extended to cattle of every description, but total confinement in the case of young cattle and milch cows cannot be indiscriminately recommended. The practice of house-feeding milch cows has hitherto obtained but little favour, simply from the circumstance of exercise being altogether withheld; but, were an hour or two daily allotted to this purpose, very different results would be obtained.—*J. Sproule.*

Home Correspondence.

Fixation of Ammonia.—I am about to commence the formation of a manure-heap on a very extensive scale, according to the plan and directions given in your Number of the 15th ult., and shall feel greatly obliged if you, or any of your correspondents, will answer me the following queries:—Is diluted sulphuric acid still considered the best article for fixing the ammonia? What quantity of water should be used for each pound of the acid? and how many pounds of acid are sufficient for two 2-horse cart-loads, exclusive of the earth, road-side scrapings, &c. laid upon each layer of fold manure in forming the heap? Should the diluted acid be used upon each layer, each day's work, at night? or the whole in proportion, upon the whole heap, when completed? and what are the most proper utensils to put the liquor into when using it, and the best way of doing so?—*Carl.* [In answer to this we extract the following from a communication by Mr. Gyde, of Painswick:—"If we assume, with Boussingault, that farm-yard dung, in its ordinary or moist state, contains 0.40 in 100 of nitrogen, we shall be within a fraction of the amount contained in a mixture of 1 of litter and 3 of excrement. Hence, we shall have in 10,000 lbs. of dung 40 lbs. of nitrogen, equivalent to 48½ of ammonia, requiring 138 lbs. of liquid sulphuric acid, specific gravity 1.85, to convert it into sulphate of ammonia (that is, supposing all the nitrogen to exist in the condition of ammonia in the dung); and if, for the sake of round numbers, we calculate the 10,000 lbs. of dung at 4½ tons, we shall require a fraction over 30 lbs. of sulphuric acid per ton, to convert the ammonia into a sulphate; each ton would then be equivalent to 40 lbs. of crystallised sulphate of ammonia. The sulphuric acid should be diluted with four or five times its weight of water before it is applied to the dung, or it will undergo partial decomposition on coming in contact with the vegetable matter in the manure. Sulphate of lime (gypsum) will not do as a substitute for acid in this case, since I find that it will not fix ammonia unless it is first dissolved, and as it requires 500 times its weight of cold water for its solution, its use in that state would be quite out of the question; nevertheless, if sprinkled freely over the fold-yard, it would fix a portion, and would be a good addition to the manure. It would require 50 lbs. of gypsum to supply 30 lbs. of sulphuric acid, or to fix the ammonia in 1 ton of farm-yard dung, provided the decomposition was complete." The acid should be added every two or three days, whenever there is any considerable accumulation of fresh manure; and it must be remembered that 30 lbs. of sulphuric acid is the quantity required to fix the ammonia in manure consisting of ¼ of litter and ¾ of excrement.]

Rooks and their Owners.—It appears to me that their counsel has completely failed in making out a case in their favour (*vide* page 321). He commences by saying, "We hail with pleasure the arrival of the rooks;" and he goes on to extol their value, till at last he admits the following faults; and I think it no trifle in seed-time to the farmer to have his seed stolen by his rooks, which pull up the young blade of the Corn, on its first appearance, to get the grain. "The pilfering lasts about three weeks; we hire a boy at threepence and sixpence to scour them off. In winter they will attack the Corn-stacks." I will mention another fact to show that they will take Corn if they can possibly come at it. A short time ago a farmer took a quantity of Corn, and steeped it in arsenic, and placed it in different parts of the field, to see whether the rooks would take it or not; they soon cleared it off, and they were found dead many miles from the place where they had got it, and the man was, therefore, troubled no more with them. Rooks are not game, and the farmer has a right to destroy them, and I think it is high time that they should be destroyed; as in page 60 it appears that the expense which they occasion amounts to 4000*l.*, in a limited district, Garstang.—*Facile.* [The farmer certainly suffers considerable injury from rooks, which would destroy a good deal of his seed, and many of his Potatoe sets in spring, were he not at some expense to prevent them. The only question for consideration is—Would he not suffer to a greater degree, were these birds destroyed, by the depredations of insects, which would then undoubtedly prevail in much larger numbers?]

Thorn Planting.—The Duke of Hamilton has been making considerable improvements upon his estates in the neighbourhood of Garstang, for some years past; and, amongst other things, I have noticed the removing of the unsightly fences, and the planting them upon an entirely different system. The present year he has planted to a considerable extent. Instead of planting the Thorns upright, he lays them; those planted upright this season appear almost dead, and have made no new wood, owing, I suppose, to the dryness of the weather; while those laid have made wonderfully fine young shoots. *Facile, Garstang.*

Daniels' Manure.—Where it has been properly applied, Daniels' manure, in some instances, has been of considerable benefit; but the season has been very much against it. I am sorry to say that, in the experiments by the farmers hereabout, the manure was not half buried, and, of course, all nutriment which was exposed was soon volatilised by the sun and air. Mr. Daniels' own Wheat was excellent; but great pains was taken to bury the substance, likewise to sow the seed. He is now giving it the sixth trial on the same land. I have seen Potatoes turn out a good crop with the manure, from a very poor shallow soil, where it would not bring sufficient to pay for cultivation before. It has been tried here with Potatoes, in a loamy soil—two quarters of acres on some arable land, one with stable manure, and the other with Daniels', and there was no difference in crop or flavour, but more haulm to the artificial. Indeed, when properly applied, I think it will be of great benefit to shallow uplands. It was carefully tried near this on pasture, in three different ways, with no benefit whatever. It is of no good to gardens on a loamy soil.—*T. Wharton, Weston, Bath.*

Farm-yard Manure.—Among the various experiments with manures which I am constantly reading about in your Paper, the grand result seems to be the showing how much farm-yard manure is surpassed by guano, nitrate of soda, bone-dust, &c. &c. Now what I wish to ask is, Whether, in all these experiments, poor farm

yard dung has a fair trial or no? that is, whether the dung is from a heap such as Mr. Gyde would find in his black horsepond yard, out of which all the gravy of the meat, if I may so say, has run away; or from a heap upon which all the juice has been pumped back, and which has had all its ammonia fixed and been made up with all the advantages which a modern muck-heap ought to receive? Because, unless it is a dung-heap of such a character, I contend that it does not stand a fair comparison with the other manures. Mr. Gyde in his admirable papers tells us, that the urine, &c., of cattle contains all the ingredients which render guano and other manures so valuable; therefore, unless the farm-yard manure is composed of all the drainage and sweepings from the stables and yard, properly made up, to try it against the host of fertilisers which have all their strength concentrated and made the most of, it cannot properly be a true test of its powers. Experimenters should state what sort of farm-yard manure theirs is, as in 90 cases out of 100 I believe it would be found to be good of its sort, but not half so good and strong as it ought to be and is entitled to be.—*R. W.* [Our correspondent's complaint is a very just one; the farm-yard manure which is used as a standard of comparison in experiments on the value of guano, &c., is rarely what it ought to be; it is generally much the worse for having its insoluble ingredients washed out of it. And there is another fault in these comparative experiments: a farmer applies manure to his land perhaps once in four years; the crops of all these four years ought to be measured and weighed before the value of the manures as fertilisers can be ascertained.]

Vetches.—I think the practice of the father of the late Mr. Webb Hall worthy of attention, even in these more enlightened days. As soon as the Wheat crop was cleared, he prepared for Vetches, and laid on all the manure intended for the subsequent Turnip crop; the Vetches, of course, were most luxuriant; and he was thus enabled to feed them off in good time for sowing Swedes, the land being in excellent condition, and having, moreover, the benefit derived from the increased quantity of manure from the sheep, in consequence of the superiority of the crop of Vetches.—*Lusor.*

Smut in Wheat.—About 40 or 50 years ago a Mr. Roger Treffry, of Beer Alston, professed to be in possession of a secret for preventing the smut in Wheat. Accordingly, about seed time, he made a tour of several of the midland counties, offering to sow seed from the most infected sample, but prepared by him; also he would take the cleanest seed, which he also prepared: these were both sown, and next year at harvest he called on those farmers who permitted him to try the experiment; when, if the smutted seed was found to produce clean corn, and the clean seed smutted corn, he was to receive three guineas for the secret: this he did, as I understood, without an exception, and realised a very handsome sum. His secret for disinfection consisted simply in thorough washing in pure water; and on the other hand, he infected the good seed by thoroughly rubbing it with the contents of smut-balls. After all, his method was not generally adopted; nor do I believe it certain of success without extreme care. I once prepared the seed for a field by well washing in two waters, and skimming off the light corn which floated; and yet the crop was more than half smutty. I am of opinion that heat is necessary to destroy the vegetative power of the sporules, and therefore adopted the following plan, which was perfectly successful, for I was never after troubled with smut. I placed the seed intended for the next day's sowing in a heap; upon the top of this was a vessel of boiling saturated solution of common salt, into which was thrown a sufficient quantity of fresh-burnt lime, the slaking of which raised the temperature far above that of boiling water, and it foamed most furiously over the vessel, and ran down amongst the Wheat; the whole was then carefully turned over several times, till thoroughly mixed; the heap dressed up neatly, and left till morning, when it was quite dry enough to drill.—*Lusor.*

Wide Drilling.—In your Leading Article, p. 413, you invite the communication of the experience of your readers on this subject. I am therefore induced to mention an experiment I tried, "long, long ago." I planted two acres of a very rich garden-loam with Wheat; one acre was dibbled in 3-feet rows, and 9 inches from hole to hole, with 2 corns in each; the other at 18 inches, and 9 inches from hole to hole. The plants grew very luxuriantly, but never covered the ground; the ears were very long and loose, and the sample thin and hungry. I have no memorandum of the product, but I considered the attempt to give Wheat so much room a complete failure. Adjoining these two acres I drilled two other acres at 16-inch intervals, which produced 70 bushels of very good Wheat.—*Lusor.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 3rd of July, present—His Grace the Duke of Richmond, K.G., in the chair; Marquess of Downshire, Earl Beauchamp, Viscount Torrington, Lord Camoys, Lord Hatherton, Col. Austen; Thomas Raymond Barker, Esq.; John R. Barker, Esq.; Geo. R. Barker, Esq.; J. Benett, Esq., M.P.; S. Bennett, Esq.; T. W. Bramston, Esq., M.P.: W. R. Browne, Esq.; F. Burke, Esq.; Col. Challoner; F. C. Cherry, Esq.; H. Colman, Esq.; E. D. Davenport, Esq.; J. H. H. Foley, Esq.; Capt. Forbes, R.N.; B. Gibbs, Esq.; W. Fisher Hobbs, Esq.; Sir John Johnstone, Bt., M.P.; Rev. E. C. Keene, J. Kinder, Esq.; Sir F. Lawley, Bt.; Sir C. Lemon, Bt., M.P.; Col. Macdouall; J. W. L. Naper, Esq.; Sir R. Price, Bt.; W. Shaw, Esq.; W. R. C. Stansfield, Esq., M.P.; and V. Stuckey, Esq.

Viscount Alford, of Carlton Terrace, London, and Ralph Creyke, Esq., of Rawcliffe Hall, near Selby, Yorkshire, were elected Governors, and the following gentlemen Members of the Society:—

Pilgrim, Charles H., Kingsfield, Southampton
Pilgrim, Charles, Kingsfield, Southampton
Beadon, Rev. Frederick, North Stoneham Rectory, Southampton
Seamark, Richard, Mount St. Alban's, Caerleon, Monmouthshire
Streeter, William, Sanderstead, Croydon, Surrey
Carson, William, Seaforth, near Liverpool
Prosser, George, Elvaston Farm, Harewood, Ross, Herefordshire
Crouch, John, Cirencester, Gloucestershire
Mitford, Charles, Pittshill, Petworth, Sussex
Butler, Hon. Sir Edward, Chilworth, Southampton
Altherly, George, junr., Southampton
Shuttleworth, Geo. Edmund, Tottenham Green, Middlesex
Waddington, John Thomas, (High Sheriff, Hants.) Twyford Lodge, Winchester
Biel, William, St. Leonard's Farm, Beaulieu, Southampton
Charteris, Hon. Francis, Armisfield, Haddington, N.B.
Parsons, John, 5, Anglesey-place, Southampton
Dobree, Harry, President of the Agricultural Society, Guernsey
Beste, J. Richard, Botleigh Grange, Southampton
Brough, John, Shaw Farm, Overton, Marlborough
Bourne, Right Hon. W. Sturges, Upper Brook-street, London
Gibson, Robert, Bagshot, Surrey
Oliver, George, Kingston, Arundel, Sussex
Vansittart, Captain Robert (Coldstream Guards), 11, Halkin-st. West, Belgrave-square
Trudgen, Henry Hodge, Trevilley, Penzance, Cornwall
Malmesbury, Earl of, Heron-court, Christchurch, Hants
Waddington, John H., Langrish, Petersfield, Hants
Miles, John, Wexcomb, Great Bedwin, Wilts
Craven, Henry, Wickham Hall, Bromley, Kent
Pinhorn, Humphrey, Fordingbridge, Hants
Tice, William, Sopley, Ringwood, Hants
Raymond, Henry Archer, Harrow Weald House, Harrow, Middlesex
Mitchell, John, 5, Hawley Road, Kentish Town
Binstead, Henry, Wicor Farm, Wareham, Hants
Knight, John Harvey, High-street, Southampton
Thompson, Thomas, St. Mary-street, Southampton
Grey, Thomas Robinson, Norton, Stockton-on Tees, Durham
Stone, William, Stonebridge, Framfield, Cuckfield, Sussex
Huddleston, Thomas, Stedcombe House, Colliton, Devon

The names of 18 candidates for election at the next meeting were then read.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, laid before the Council the Monthly Report of the Committee on the state of the Funds of the Society; from which it appeared, that at the end of last month the amount of invested capital was 7700*l.*, and the current cash balance in the hands of the bankers' at the same date 3457*l.* Mr. Barker explained to the Council that this balance included 800*l.*, on account of the Southampton subscription, of which the Committee had recommended a further sum of 500*l.* to be paid to meet the expenses already incurred in making the requisite preparations for the ensuing country meeting at that place, leaving 200*l.* of the subscription of 1000*l.* originally remitted from Southampton still remaining in the bankers' hands, and available for further claims on that account.

Colonel Challoner, Captain Forbes, and Mr. Benett, M.P., and Mr. S. Bennett, favoured the Council with the results of their trials to effect the extirpation of rats from their respective premises; Colonel Challoner taking that opportunity of correcting a misapprehension of his statement at a former meeting as to the extent of his experience of Mr. Meyer's preparations. At that time, his application of those preparations had been limited to a broad Holly-hedge in his flower-garden, where they were found to be perfectly successful.—Mr. Manning, contractor of the Society's works at Southampton, addressed a letter to the President in reference to the site of the Pavilion; Messrs. Drummond, of Stirling, and Messrs. Morton, of Edinburgh, replied to the inquiries of the Council on the subject of Braby's draught-machine. The Rev. C. J. James, of Braintree Rectory, called the attention of the Council to the condition of agricultural labourers, and the intentions of the Committee appointed to report to the Council on that subject; and the Highland and Agricultural Society of Scotland announced the reservation of tickets for members of the Royal Agricultural Societies of England and Ireland who might be induced to attend the ensuing meeting at Glasgow. The Marquis of Downshire invited the attendance of members at the ensuing meeting of the Royal Agricultural Improvement Society of Ireland at Dublin, where the authorities were prepared to receive them with every attention. Mr. Brandreth Gibbs presented copies of the Prize Sheet of the December Show of the Smithfield Club.

The Council then adjourned to Wednesday next, the 10th of July.

HIGHLAND AND AGRICULTURAL SOCIETY.

AT a late meeting of Committee, for making the necessary arrangements for the ensuing great Agricultural Meeting at Glasgow, the following Report was read:—The local Committee, upon their appointment in January, 1843, commenced operations by taking steps to unite the adjoining counties of Lanark, Renfrew, Dumbarton, Ayr, Argyll, Bute, and Stirling, in constituting the Show, and are happy to state that all these counties agreed to combine for the purpose, with the exception of Stirlingshire, which declined to have any connexion with the Show. The local Committee have given their best endeavours to frame a list of premiums to be awarded for stock, which should be properly adapted to the different breeds deserving encouragement in the districts composing the Show; and they hope that the list which has been published, which was drawn up with the aid and under the superintendence of the Edinburgh Committee, will afford satisfaction. The premiums advertised amount to 1575*l.*, being the largest sum ever offered for competition at any of the Society's Shows; and it is expected that the number and liberality of the premiums will attract an unprecedented display of stock from all parts of the country. The requisite funds are not yet fully realised, but with a little exertion there is no doubt of the sum subscribed being perfectly sufficient to meet all liabilities. The 7th, 8th, and 9th days of August have been fixed upon as the most eligible time for holding the Show, avoiding alike the Goodwood races, at which the Duke of Richmond and the Earl of Eglinton must be present, and the commencement of the shooting season. Part of the public Green of Glasgow has been kindly granted by the magistrates as the site for holding the Show, which is peculiarly adapted for the purpose, and will afford abundant accommodation. It has been resolved, instead of building a temporary erection, to have the public dinner within the City Hall of Glasgow, which can, at comparatively small expense, be fitted up to accommodate 1800 people with comfort. A plan of the Green, and the portion allotted for the Show, at the Flesher's Haugh, was exhibited. It seemed to satisfy all present, and it was left to a committee that were appointed to make every proper arrangement for securing the grounds, and for the necessary accommodation of the committees, the judges, and all concerned in the proceedings. The following are the plans for the three days of the Show:—Wednesday, 7th Aug.—The exhibition of agricultural implements, dairy produce, roots, seeds, and plants; to conclude with the Committee's dinner, and a grand ball in the evening. Thursday, 8th Aug., will be the great day—set apart as it is for the general show of cattle, horses, sheep, swine, and the whole of the articles exhibited on Wednesday. The business will be wound up by a grand public dinner in the City Hall, with the Duke of Richmond, president of the Society, in the chair. Friday, 9th Aug.—This day will be employed in the exhibition of the prize stock, implements, &c. It was also arranged that Mr. Smith, of Deanston, and Professor Johnston, should, either at the public breakfast, or at some other time during the proceedings, deliver lectures on draining and agricultural chemistry. It was stated that the City Hall would accommodate 1800 at dinner, and it was agreed that tickets should be on sale, *to members only*, until the 27th July—thereafter the public to be served as they applied; a certain portion, until a particular date, being laid aside for the gentlemen belonging to Societies in England and Ireland.

FARMERS' CLUBS.

Chelmsford Wool Fair.—Mr. Towers, who presided at the public dinner on this occasion, made the following remarks on the state of the wool trade. He stated that the buyers had said there had been a material rise in wool over last year, though not in proportion to what was stated, but still a material rise; and they would see that it was impossible it should not be so when he detailed the fact that in 1843, advancing from several former years, the export of wool to Belgium and France was 8,000,000 lbs.—6,302,000 lbs. to the former, and 1,677,000 lbs. to the latter—as was shown by the return on the wool-trade made on the motion of Mr. Miles. Now, in fact, this had been going on at the same time with a decrease in the import of wool. If they looked back to the same document, they would find that from 1836 to 1840, the average import of foreign wool was 54,406,049 lbs.; but from 1841 to 1843 the average import was only 50,410,902 lbs. Therefore, there had been in the last three years a diminution of about 4,000,000 lbs. in the import of wool, which had taken place at a period when, from the extension of mechanical skill in the production of machinery, the competing power of the manufacturers had been largely increased; and, strange to tell, the sales of perfect and completed manufactured goods during that time, had only maintained the average of little more than five or six millions. How was this to be accounted for? By this extraordinary fact, that there had been of late not only an export of 8,000,000 lbs. of their wool against an import of 50 millions some odd thousands, but an export of British woollen and worsted yarn to the amount of 7,306,392 lbs., being an increase on the former year of 1,423,262 lbs. There had, therefore, been a double export of the raw material, first of our wool, and then of woollen and worsted yarn, which was the first manufacture from the wool; and this had fallen so heavily upon the reduced imports, that the manufacturers of the country were found to be in want of wool to meet the magnitude of their operations. He should be unwilling to check the desire of the sellers to sell, yet as the proceedings of this meeting were going forth to the country, and giving a tone to other fairs, it would have been wrong in him not to have stated relatively the situation of the buyers and sellers. There were points in the current year most favourable to the sellers; the buyers were consulting their interests in buying their wools on the most favourable terms they would offer them; and he did not believe that by holding back and speculating on the price, the growers would be consulting their own interest, for he did not think the farmer had a right to be a speculator. But let the buyers be aware of this, that he had placed it beyond contradiction that it was their interest to make purchases provided they received offers favourable to their views. Let him call attention to the fact, that in Belgium and France the manufacturers admitted that British wool was of the greatest importance to them, as they required it to form the warp for their finer wools, in making the cloths and

the particular quality of goods in which they all knew Yorksbire dealt.—*From the Chelmsford Chronicle.*

West Norfolk.—At the late meeting of this Agricultural Association Mr. Hamond made the following remarks:—If you go into the society of intellectual farmers you will hear them talk of their business, of how they can produce the best crops by the most economical means; how one crop answers, how another answers, what are the best kinds of manure, and how to apply chemistry to farming. All these things tend to open men's minds, and to make them better farmers and better men. And if any of us knows a little bit of chemistry, let us not bottle it up nor take out a patent for it. There has been a great deal written by Professor Henslow on the subject of gypsum. I tried a little, but did not get on at all with it. Instead of using the sulphate of lime, I mixed sulphuric acid with water, and watered the manure-heaps with it. I do not profess to have made an accurate experiment; but after using twenty loads of this manure, I can say there was a great improvement in the tops and bottoms of Mangold Wurzel. I have turned over every load of manure with diluted sulphuric acid. If you like to try it, one gallon of sulphuric acid, which costs 1*s.* 9*d.*, to 36 gallons of water, will be the quantity for 20 loads of manure. The experiment is not very expensive, and I really would strongly recommend you to try it.

Reviews.

Supplement to Loudon's Encyclopedia of Agriculture. By J. C. Loudon, F.L.G.Z., and H.S., &c. Longman, Brown, Green, and Longmans. 1844.

Those who possess the "Encyclopedia of Agriculture," published by the late Mr. Loudon in 1825, will need this volume to complete that work. It brings down improvements in the art of field culture from 1831 to 1843 inclusive.

These improvements are enumerated in an instructive Preface, from which we extract the following paragraphs:

"The functions of the leaves of plants are beginning to be more generally understood; and hence, also, the importance of allowing sufficient space for their exposure to the sun and air, by wider sowing or planting, by judicious thinning, and by pruning.

"Hence, also, when plants are to be destroyed, this may be effectually done by cutting off their incipient leaves as fast as they appear. In this way Ferns and other perennial weeds in pastures may be more easily destroyed than by any other mode; and the same may be said of weeds growing up from the bottoms of ponds.

"As a proof that the use of leaves was not understood by practical men, and even by the officers of the Highland and Agricultural Society of Scotland, so lately as 1836, we may refer to the Transactions of that body; in which we find the Society giving a premium for an essay on the destruction of Ferns in pastures, to a candidate who recommends as the best mode the irrigation of these pastures. The irrigation of pastures on which Ferns abound may be considered impracticable in ninety-nine cases out of a hundred.

"Growth and maturation in plants are two separate processes, and when either is the main object of culture, the other should be prevented or checked; thus when seeds or fruits are maturing, the elongation of shoots and the production of leaves should be checked, by pinching them off as fast as they appear. Hence the use of topping Beans, Tobacco, Woad, and even Potatoes; not to mention Vines, Gooseberries, Raspberries, Peaches, and other garden fruit shrubs and trees.

"By preventing the formation of seeds or fruits, more strength is thrown into the plant generally; and if it is a plant which produces bulbs, tubers, or underground stems, as substitutes for seeds, these will be increased in size. Hence the use of picking off the blossoms of Potatoes.

"Plants imbibe nourishment from the soil, chiefly from the points of the fibres at the extremities of their roots. Hence, the practice of banking up hedges, Beans, Potatoes, and other plants in drills, and of watering, stirring the soil, and laying manure close to the stems of trees and plants, is erroneous in principle and often injurious in effect, by cutting off the fibrils, or, in the case of Potatoes, the underground shoots on which the Potatoes are formed. In some cases, however, cutting off the extremities of the roots is useful by increasing the number of fibrils, and consequently of the spongioles or mouths by which nourishment is imbibed.

"Hence the Berwickshire practice of tabling hedges, so much recommended and so generally followed by Scotch bailiffs, foresters, and hedgers, is for the most part a waste of labour; unless, indeed, the object be to stunt the growth of the hedge, and prevent its roots from robbing the soil of the adjoining fields. The practice of earthing up Turnips was once in vogue, but it is now ascertained to be a certain mode of instantly checking the swelling of the Turnip, by the pressure of the soil which is thrown up to it by the plough.

"The progress of the ripening of seeds and fruits in general goes on in a geometrical ratio, and hence the great nicety required to determine the moment when seeds or fruits should be gathered, which period varies according to the purpose to which the seeds or fruits are to be applied. The last change which takes place in the ripening of Wheat is an increase of bran or husk, and a relative diminution of farinaceous matter or flour; and hence the immense difference in the produce in flour, between that of the grain of a field of Wheat cut down at the proper time, and a field of Wheat allowed to be over ripe. Too much importance can hardly be attached to this subject.

"Running water is found to contain oxygen, potash, carbonic acid gas, and ammonia, all which serving as manures for plants, it follows that irrigation, even in cold climates, is beneficial to Grass lands, altogether independently of supplying water as an element of growth, which in cold climates is seldom wanted in that capacity.

"More importance is now being attached to the ascertaining of the mineral constituents of plants, such as alkalies and alkaline earths, phosphorus, sulphuric acid, silica, &c., than was the case before the appearance of 'Liebig's Organic Chemistry.'

"The permanent fertility of a soil is found to depend more on the inorganic substances which it contains, (for example, on the proportion of alkalies and alkaline earths which it holds in combination with the silicic, phosphoric, sulphuric, and other acids,) than on its organic constituents, such as humus or decaying vegetable matter; for all organic matter in soil, whether that soil be naturally good or bad, is sooner or later exhausted by the growth of plants; and if the supply is not kept up, the soil reverts to its original state, except in so far as it may have been improved mechanically by draining, levelling, shelter, &c.

"Alkalies are the most important inorganic constituents of soils, and when a soil has been exhausted of them by cropping, no manure that does not contain alkalies will restore their fertility for agricultural plants.

"The poorest soils are almost invariably those which contain least alkalies and alkaline earths.

"Animal manures contain a much greater proportion of the inorganic constituents of plants, than vegetable manures; and the most powerful of animal manures are those of carnivorous or omnivorous animals; for example, of the human species.

"Saline manures not only supply food, but, acting as stimulants, enable plants to derive more food from the soil and the atmosphere than they otherwise would do.

"The ammonia of liquid or other manures may be fixed by gypsum or sulphuric acid; or, in default of these, it may be prevented from evaporating by mixing with soil or diluting with water. In general the most convenient and economic mode for the British agriculturist is to mix it with farm-yard manure, or, what is better in our opinion, plenty of surface soil.

"The chief practical advantages which have as yet resulted from the recent discoveries in chemistry, as applied to agriculture, are the employment of saline manures, and the recognition of their importance, the mixing of azotised (nitrogenised) with unazotised (unnitrogenised) food in feeding and fattening cattle, and the procuring greater warmth for the domestic animals of the farm.

"The most useful practices which have obtained extended diffusion within the last ten years are, the frequent drain system, long practised in Essex and Suffolk, but recently brought conspicuously into notice by Mr. Smith of Deanston; the use of draining-tiles instead of stones; the use of the subsoil plough, and of the cultivator as a substitute for the plough in various cases; the greater eagerness to procure improved implements, machines, and buildings generally; the mixture of soils; the greater value set on urine and liquid manure generally; the use of single-horse carts; the selection of improved varieties both of animals and plants, and the employment of land agents, conversant with agriculture, instead of lawyers or others who have little or no agricultural knowledge.

"The details which have led to the above summary will be found in Liebig's 'Organic Chemistry,' and 'Animal Chemistry;' Johnston's 'Agricultural Chemistry;' Trimmer's 'Practical Chemistry for Farmers and Landowners;' Solly's 'Rural Chemistry;' Dr. Playfair's Lectures on Rearing and Feeding Cattle, published in the 'Journal of the Royal Agricultural Society,' vol. iv.; Donaldson's 'Manures, Agricultural Grasses, and General Management of Landed Property, &c.' The greater part of this Supplement consists of extracts from these works; and from the 'Quarterly Journal of Agriculture,' the 'British Farmer's Magazine,' the *Gardeners' Chronicle*, and the 'Gardeners' Magazine.'"

The information given in this volume is arranged and classified with all that skill and order for which its author was distinguished. In Part 1st Agriculture is considered as to its origin, progress, and present state. In Part 2d it is considered, subjectively, as a science and an art; thus we have, under successive heads, an immense mass of matter on the animal kingdom, the mineral kingdom, and the atmosphere, with reference to Agriculture; on the mechanical agents employed in Agriculture; and on the operations of Agriculture. In Part 3d Agriculture as practised in Britain is described, more especially with reference to the arrangement and improvement of estates. And Part 4th gives information on the statistics of British Agriculture. Though certainly a supplementary work, it is nevertheless to a great extent complete, inasmuch as the practice, and our knowledge of the science of Agriculture have improved to an unprecedented extent within the period the improvements of which it professes to detail. We therefore recommend this work even to those who may not be in possession of the original edition. It contains a great mass of useful information on agricultural subjects, admirably arranged, and fully illustrated by wood-cuts, where these are necessary.

Farming for Ladies; or, a Guide to the Poultry-yard, the Dairy, and the Piggery. By the Author of "British Husbandry." London: John Murray, Albemarle-st.

This is an elegant octavo volume, containing in full detail information on the management of all kinds of Poultry, with chapters on the Pigeon, the Rabbit, the Goat—on the Dairy and the Piggery. It is illustrated by woodcuts whenever these are required; and it is ornamented by a drawing of the Queen's poultry-yard at Windsor. The Preface says that it is not intended for the mere cottager, nor for persons of large fortunes, but for those ladies in the middle ranks of life who study healthful domestic economy, either for the pleasure or the profit which it affords; and it certainly is just the kind of book which any one not possessed of practical experience on the subject would wish for, to receive instruction from. The chapters on the Dairy contain a variety of information, by attention to which, professional as well as amateur farmers might benefit.

Miscellaneous.

Adulteration of Manures.—A paragraph somewhat as follows would seasonably issue from your Journal:—"It is projected by several leading agriculturists to establish, during the Southampton Meeting, a Protection Society against the frauds practised upon the farmer by the importers and manufacturers of manures, Linseed-cake, &c. &c. It is well known that the whole of the 'scutch' (the refuse from the curriers' yards) from Scotland, is imported into Hull to be mixed with the crushed bones, and sold to the simple farmers as genuine bone-dust. Also that foreign Linseed-cake of very inferior value is re-crushed with the dregs of the Linseed-oil, and sold by the Hull manufacturers as English cake. It is lamentable to observe merchants moving in a respectable station of society demean themselves by such gross swindling. It is intended by the Society to employ chemists to analyse samples of manure and cake, and to make examples of dishonest traders, by instituting actions-at-law at the cost of the Society. It is earnestly hoped the farmers generally will associate themselves with the Society, that an immediate stop may be made to the robbery imposed upon them."—*Agricola, in the Farmers' Journal.*

Scientific Lecturers.—To the Council of the Royal Agricultural Society of England: The Memorial of the Cardiff Farmers' Club, respectfully sheweth,—That your Memorialists feel deeply impressed with the great advantages which must result to the Agriculture of this kingdom from the extended operations of the Royal Agricultural Society. That they further believe that in the formation of farmers' clubs your Council will possess an additional and most important means of diffusing practical and useful knowledge amongst the cultivators of the soil. That your memorialists beg leave most respectfully to state that they are fully of opinion that the great objects contemplated by the Royal Agricultural Society would be greatly and most beneficially promoted by the employment of real practical and scientific lecturers, who would from time to time visit the various farmers' clubs now formed, as well as to assist in the formation of others, and to convey through the means of lectures or otherwise to these clubs the various improvements in the cultivation of the land; in the breeding and feeding of stock, and in the most approved varieties of grain, roots, &c., which have been successfully adopted in other parts of the kingdom. That the recent establishment of so many farmers' clubs in different parts of England and Wales offer facilities for diffusing such information throughout the rural districts which have never before occurred; your memorialists therefore earnestly hope that the Royal Agricultural Society of England will adopt such measures as may seem to them best adapted to the attainment of so desirable an object. Signed on behalf of the club, E. David, Chairman.—*Report of the Cardiff Farmers' Club.*

The Tick, Fly, &c.—Sheep are much exposed to the attack, and suffer much from the effects, of various insects and vermin. One of the most common and well-known is the tick, which though commonly about the size of a pea, is sometimes much larger. It attaches itself to the skin by means of sharp claws at the extremity of the legs, and pierces the skin with sharp instruments attached to the head. The tick propagates rapidly, and is often found in great numbers on a single sheep, selecting the neck and shoulders in preference to other parts. It may be destroyed by the application of turpentine, linseed oil, or mercurial ointment, or dipping in a solution of arsenic. Lice are sometimes a source of much annoyance, but may be destroyed by mercurial ointment, solution of arsenic, or tobacco-water. The fly is a still more formidable enemy, causing more irritation, and leaving behind more severe effects. It abounds mostly in woody localities, and in the month of May deposits its eggs on the sheep, selecting a sore, if there is any to be found, which is often the case, particularly about the head. The maggots being hatched burrow under the skin, causing severe irritation, and producing frequently extensive and troublesome wounds. The sheep exhibit much uneasiness soon after being struck, often stamping, biting themselves, and running about the field with much violence. The wounds, if neglected, soon spread, and I have known the most severe and complicated fistulous wounds produced thereby,—extending between the shoulders and becoming incurable. The most simple preventive to the attack of the fly is the application of coarse whale oil to the parts most likely to be attacked. The fly has such dislike to even the strong smell of the oil, that it acts as a safe protection, and is much more simple than the application of a plaster, as sometimes practised. A striking instance of the effect of the oil is mentioned by Mr. Hogg in his "Shepherd's Guide." As a local application, immediately after the sheep have been struck by the fly, white lead is one of the best, and it will also act as a preventive.

It is rendered still more effectual when mixed, as in the following recipe, and on being scattered over the parts will speedily destroy the maggots :—

White lead	4 ounces.
White arsenic	1 ,,
Sulphur	6 ,,
Cinnabar of antimony . . .	2 ,,

Each to be finely powdered, and the whole then well mixed. It may be rendered weaker, and perhaps more suitable when employed as a preventive, by diminishing considerably the proportion of arsenic. The following is the application used at Holkham successfully in the flocks of the Earl of Leicester :—

White arsenic . .	1½ ounce to 1 gallon of water.
Soap	3 ,, ,,
Tobacco . . .	2 ,, ,,

The arsenic is boiled in a bag, and kept stirred at the time of boiling. The tobacco is also boiled in the same manner, and put into the water when cold. The soap is cut in thin slices, and the whole of the mixture boiled for half an hour. One pint and a half to be applied to each sheep. Earl Spencer observes—"It is better to dip the lambs immediately after the ewes are shorn than after weaning. The shearing the ewes destroys or removes the ticks which were upon them, and the dipping destroys those which were upon the lambs; whereas, if it is postponed till the lambs are weaned, the wool on the ewes will have then grown long enough to shelter ticks, which have come upon them from the lambs after the time of shearing." If the sore, from inattention or neglect, has spread, the application of the following astringent powder will be desirable :—

Prepared chalk	6 ounces.
Alum	1 ,,
Armenian bole	1 ,,
White lead	1 ,,
Chloride of lime . . .	1 drachm.

Each to be finely powdered, and the whole then well mixed together.—*From Mr. Spooner's Work "On the Sheep."*

Cultivation of Root-crops on Heavy Land.—I must first observe that much of my land has been laid out in wide ridges of eight yards, gathered twice from the flat, and drained where needful with tiles and stones up every furrow; the remaining part of the farm is in lands of six feet or two yards wide, and has been drained many years since with shallow stone drains in a direction across the run of the furrows at intervals of eight or nine yards, and with tile heads. This method of draining does not answer upon our close and adhesive clay soils, as it does not carry off the surface water readily. It is my intention to set out these lands afresh, and to put them (as I have done the others) into ridges of eight yards in width, and to intersect the old drains, where necessary, by running others up the new furrows, at intervals of sixteen or thirty-two yards. By this means I hope to give the old drains a quicker vent, and to enable them to discharge the water more readily than they do at present. Other drains may at a future period be laid in those furrows which are at first missed, whenever it may appear necessary. We will now suppose the ground drained, and rendered as sound and dry as such land can be made. We will also suppose the land to be in fair condition and tolerably free from couch and root weeds (for should the field have been run out, as we say, and full of couch, a naked fallow on this kind of soil must of course be resorted to). My mode of proceeding will be thus :—I shall in the first place have the ground very carefully looked over, and with three-grained forks dig up every blade of couch and every dock that can be seen; having previously finished, as I said on a former occasion, sowing my winter Vetches and drilled my Wheat. The land intended for a root crop is then to be ploughed, in a direction diagonally to the run of the furrows, into single bouts of twenty-seven or twenty-eight inches; or into two-bout ridges where Cabbages are intended to be grown. The appearance of the field will then be like garden ground laid up in trenches. I should plough as deep a furrow as practicable, exposing a large surface for the winter frosts to mellow and sweeten. After the land has become sufficiently pulverised and the trenches are in a dry state, with a double mould-board plough I purpose thoroughly to open out and considerably deepen them, directly following with a stout plough, having the turn-furrow taken off, and with a strong team of horses harnessed at length, subsoil or stir the hitherto unmoved soil in the bottom of every furrow trench, as deeply as may be practicable—six or eight inches at the least. This being not trampled on while in a moist and tender state, will lie light and hollow for the air and frost to sweeten and pulverise. Nothing will have to be done now to the land till the dry weather sets in in the early spring, be it in February or the beginning of March; at which time I intend to set the dung carts to work, and having spread the manure carefully in the bottom of the trenches, with a pair of horses driven abreast cover it up, by splitting or reversing the bout ridges. These are again to remain untouched till well dried and pulverised, when an opportunity will be afforded of subsoiling or stirring the intervals. Thus, then, nearly the whole of the ground will have been loosened to the depth of twelve inches at the least, and a sufficient tilth gained, and that too at no very ruinous expense. I prefer to cultivate my Turnips and other roots (such as Cabbage and Beet) on the ridge system after the Scotch manner, because it will give me an opportunity of working the ground deeply and frequently, during the growth of the crop; and because it will allow me, at the time of singling out the Turnips, to draw the earth well away from the plants, whereby they appear to swell, and form better bulbs.—*Mr. N., in the Report of the Gloucester Farmers' Club.*

Serious Loss of Sheep.—Some time ago, the extraordinary number of 49 sheep had been lost by Mr. Fountain, of Leake, under the following circumstances:—The flock had been for some weeks kept on Swede Turnips, and on being removed, was driven for a few miles, and placed on a piece of meadow land. The next morning, many of the sheep were perceived to be afflicted with symptoms of lethargy, and appeared to be otherwise out of condition; and within forty-eight hours of their being placed on the meadow land it was found necessary to slaughter from fifteen to twenty; since then they have continued dying, and on Friday night the number lost amounted, as above stated, to forty-nine. The animals, it seems, were afflicted with inflammation of the kidneys, supposed to have been produced by the distance they were driven, and the sudden change of keep.—*Boston Herald.*

Notices to Correspondents.

BOOKS.—*S.*—Low's "Elements of Practical Agriculture."

BOKHARA CLOVER.—*F. E.*—This plant—such specimens of it as we have seen—is only eatable by cattle when it is young; when old it is shrubby. Its name is derived from that of the country from which it is said to have been brought.

CLOVER SEEDS.—*Carl.*—We are in the habit of sowing 10 lbs. of Red Clover, 5 lbs. of White Dutch, and 5 lbs. of Trefoil per acre. Our Clovers are all fed off by sheep, and therefore we sow no Rye-Grass, for much of it would be left on the ground uneaten, and the pasture would be left in a tangled condition. A smaller quantity per acre, preserving the proportion of the different kinds, would probably be sufficient seed per acre. We should prefer your No. 1 mixture to the other, *i. e.*, 14 lbs. Red Clover, 3 lbs. White Clover, 2 lbs. Trefoil, 2 lbs. Rib-Grass, half peck of Rye-Grass per acre to 12 lbs. of White Clover, 2 lbs. of Trefoil, and half a peck of Rye-Grass. What may be best for the southern part of the kingdom might not, however, suit the North Riding of Yorkshire.

DAIRY STOCK.—*X. Z.*—A cow will generally consume about 2 cwt. of hay a week, or about 130 lbs. if, as you propose, you give her ¾ cwt. of roots per diem besides. You can supply with roots from October till May or June; and if your land will yield an average crop of 30 cwt. of hay per acre, half of it mown will supply you with more hay than you will be able to consume in this way with the stock which the other half will keep during the summer months, so that you will have to supply them with Clover, Vetches, &c., from other land during the summer too. The data now supplied will enable you to calculate for yourself.

FALLOW LAND.—*R. W.*—You had better ridge-drill the land up at intervals of 26 inches, and sow a late Turnip as soon as you have rain; or if your land is thoroughly dry and pulverised, you may sow it now—4 or 5 lbs. of seed per acre—and wait for rain. The failure of the Potato set is a very common complaint this year.

LIME.—*Calx.*—If stone-lime be burnt and left in the heap exposed to wet and winds, &c. (it not being wanted for use before next spring), its power of action on the land will be injured, but not destroyed.

LIQUID MANURE.—*Constant Reader.*—It is not right to put caustic lime amongst urine; it will volatilise the ammonia. Mr. Dimsdale has been applied to.

LUCERNE.—*J. Heaton.*—Your Chinese Lucerne is darker in the flower, and is also a more luxuriant specimen than any we have seen this year, but it does not otherwise appear to differ from the common variety. The dry weather we have had has made it fortunate that you did not wait till after the first mowing for your seed-crop.

MANURE, &c.—*Cottage Gardener.*—Your fault must have been one of omission, not of commission, *i. e.*, if the failure of your Onions is chargeable on you, and not on the weather; the manure you applied cannot have killed them.

SUPER-PHOSPHATE OF LIME.—*Subscriber.*—It differs from the phosphate in containing twice the quantity of phosphorus, and in being soluble in water. Apply 2 cwt. per acre, mixed with turf-ashes early in spring upon your Grass-land.

TITHE AND RENT.—*G.*—Theoretically, tithe is one-tenth of the produce. Rent may be one-half, one-fourth, one-sixth of the produce, or any other fraction, dependent upon the expenses and returns of cultivation, and the demand, whether natural or artificial, which may exist for land. You will thus see there is no necessary proportion existing between rent and tithe.

WEED.—*R. H. C.*—Your weed can be extirpated only by perseverance in cutting the plant off whenever it appears. We know of no easy plan of destroying it.

***As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, July 1.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 10	to 4s 2		Best Downs & Half-breds	3s 10	to 4s 0	
Best Short Horns	3 6	3 10		Best Long-wools	3 8	3 10	
Second quality Beasts	3 2	3 6		Ewes and second quality	3 4	3 8	
Calves	3 4	4 0		Lambs	4 0	4 8	
Pigs	3 4	4 0					

Beasts, 2519; Sheep and Lambs, 33,570; Calves, 197; Pigs, 369.

We have a very fair supply of Beasts to-day, both as regards numbers and quality; buyers are also numerous, and the dead trade of late having been pretty good for Beef, there was a brisk demand for the best qualities at an advance of nearly 2d per 8 lbs on last Monday's prices, although 4s 2d was obtained for several of the best Scots, and 3s 10d for several of the best Short-horns, yet many very good of both descriptions were sold at 2d per 8 lbs less. In Sheep and Lambs there is an increase of numbers, on the whole, the supply of the best qualities of Sheep, however, is but moderate; they fully maintain, and in some instances rather exceed, our late quotations, some of the most selling Downs, &c. making 4s 2d, and Longwools 4s per 8 lbs; still, the trade ruled very heavy, and these prices could not be currently obtained. There were a great many Lambs, and the trade for them very heavy at rather lower rates. Calves are heavy trade, at rather lower prices. Pork remains about the same, but a dull trade.

FRIDAY, July 5.

We have quite enough Beasts to meet the demand, though rather fewer than last Friday; prices are rather lower; the best Scots, &c, make no more than 4s, and the best Short-horns 3s 8d. The supply of Mutton is good, and prices remain the same as on Monday. We have a large quantity of Lambs, the trade for which is very bad, owing to immense quantities being sent dead during the week; some of the very best make 4s 8d per 8 lbs, but many good ones are sold at from 4s to 4s 4d. Calf-trade is a little brisker, but no higher prices are obtained. Pork about the same.

Beasts, 743; Sheep and Lambs, 12,150; Calves, 469; Pigs, 309.

41, West Smithfield.

WOOL.—BRITISH, FRIDAY, July 5.

WE are able to report to-day as favourably of our English Wool Market as we did last week. At the several Wool Fairs which have recently been held, the greater part offered has been sold, but not at an advance upon our late quotations. We see nothing in the prospects of the trade which leads us to look for any material and permanent advance in price.

JAMES PERRIN, Wool Broker.

POTATOES.—SOUTHWARK WATERSIDE, July 1.

The weather has been all that could be desired since our last; there was a fine rain fell in London and its suburbs on Tuesday last, which, without intermission, continued for eighteen hours, and being followed by some cloudy days, must prove very beneficial to the crops. There was but little done in this Market during the past week. Perth Reds have finished badly, several damaged lots have been sold for the cattle at 30s.

MARK-LANE, MONDAY, July 1.

OUR supply of English Wheat by land carriage samples this morning was moderate, nevertheless the trade ruled excessively heavy, and a large proportion remained unsold, although offered at a decline of from 1s. to 2s. per qr. The arrivals of Foreign are rather large; Millers evinced great reluctance to purchase, and where sales have been effected, late prices were barely maintained. The Flour lately arrived from Canada appears to be of good quality, and is saleable in retail at 30s. to 31s. per barrel.—Barley was held at our quotations, which buyers were unwilling to comply with, and business was very limited.—Beans must be written from 1s. to 2s., and Grey Peas 1s. cheaper, but the value of White is supported.—Having a large show of Oats, sales were slow at a decline of 1s. to 2s. per qr.

FRIDAY, July 5.

The English Wheat left over from Monday has been pretty well cleared off at that day's prices; the demand for Free Foreign is exceedingly limited, but the trade nevertheless very firm, a considerable quantity of rain having fallen during the week, with an appearance of more.—In Barley there is scarcely any business doing.—Beans and Peas are difficult to quit, and rather cheaper.—The Oat-trade continues very heavy, and must be written fully 6d. lower than our late quotations.

KINGSFORD AND LAY.

HOPS, FRIDAY, July 5.

The accounts from Sussex, Weald of Kent, and Worcester, continue to come unfavourable, and the market remains the same as last week.

PATTENDEN & SMITH, Hop-Factors.

COVENT GARDEN, JULY 6.—The supply of Fruit and Vegetables have, in most intances, been very good during the past week, but trade for some things has been dull. Pine Apples have not varied much since our last report. Grapes are also selling at nearly the same prices; among them we observed fine specimens of Black Hamburghs, which are very plentiful. Melons are good, and although not abundant, are sufficient for the demand. Peaches and Nectarines are quite as plentiful as they were last week, and are offered at the same prices. Cherries are likewise good and plentiful. Strawberries are abundantly supplied, and are low in price; among them are good samples of Myatt's British Queen and Keen's Seedling, as well as of other varieties. Ripe Gooseberries are plentiful, as are also Currants: the latter are very good in quality. Of Vegetables, except in one or two instances, there is an abundance. Peas, in particular, are very plentiful; but the demand for them is not good, and, consequently, they are low in price. The best French Beans are offered at about 10s. per half-sieve. A considerable quantity of new Potatoes, of good quality, imported from Holland, has been in the market this week. Asparagus is becoming scarce; a small quantity may, however, still be procured; the best is selling at 4s. 6d. per 100. Rhubarb is not plentiful, being nearly over for a season. There has been little alteration in the prices of Cauliflowers, Cabbages, Carrots, and Turnips since last week. Vegetable Marrow is offered at from 1s. to 2s. per dozen. Leeks are very small. Lettuces and other Salading are abundant. Among Cut Flowers we noticed Erica ampullacea and cerinthoides, Heliotropium peruvianum, Lilium longiflorum, Sweet Peas, Pinks, Lily of the Valley, Verbenas, Pelargoniums, Gardenias, Fuchsias, Cacti, Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb., 4s to 8s	Oranges, per dozen, 1s to 2s 6d
Hothouse Grapes, per lb., 2s to 6s	— per 100, 6s to 16s
Melons, each, 3s to 6s	Lemons, per dozen, 1s to 2s
Peaches, per dozen, 6s to 12s	— per 100, 6s to 14s
Cherries, per lb., 1s to 3s 6d	Almonds, per peck, 6s to 7s
Currants, per half-sieve, 2s to 5s	Sweet Almonds, per lb., 2s 6d to 3s

Supply large, with a dull trade at the above prices.

HORTICULTURAL SOCIETY OF LONDON.—LIST OF PRIZES

OFFERED AT THE EXHIBITIONS IN THE GARDENS, IN 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.

		value—£	s.	d.
C.	The Certificate	0	10	0
SB.	Silver Banksian Medal	1	0	0
SK.	Silver Knightian Do.	1	5	0
LS.	Large Silver Do.	1	15	0
SG.	Large Silver Gilt Do.	4	0	0
GB.	Gold Banksian Do.	7	0	0
GK.	Gold Knightian Do.	10	0	0
LG.	Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in *CC*, *DD*, and *EE*.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in *B* cannot also exhibit in *C*.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants, in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—B—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter *F*, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in *I* will be allowed to exhibit also in *K*.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceæ, Cacti, and Pelargoniums, to be excluded from *P*, *Q*, and *R*.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in *P* not to compete in *Q* also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in *P* or *Q* will not be allowed to compete in *R* also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceæ, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes, *V*, *W*, and *X*.

W. Exotic Orchidaceæ, in collections of not fewer than 6 species. —GK—GB—SG.

X. Exotic Orchidaceæ in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.*

DD. Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

EE. Seedling Florists' flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

In Addition to any medals assigned to the classes *I*, *P*, *Q*, and *W*, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT, for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2*s.* cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2*s.*

Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s.* cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1*s.* 9*d.*

In one small volume, price 15*s.*,

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

Price 7*s.*, Illustrated with Wood-cuts of Birds, Cages, &c.

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact rivals the beauty of the Annuals."—*Weekly Dispatch.*

"A very delightful book of its kind. . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.—It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible: the demonstrations of propositions are made plain for the mind, and brief for the memory: and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s.* 6*d.* cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated and rendered practically useful to the various purposes of Life, with numerous Cuts. Second Edition. 4*s* 6*d* cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s.* 6*d.* cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s.* 6*d.* cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID,
With Explanatory Appendix and Exercises. Price 4*s.* 6*d.* bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS a Key to the Exercises appended to the Elements. Price 3*s.* 6*d.* bound.

COOLEY'S FIGURES OF EUCLID, with Enunciations. Price 1*s.* 6*d.*

London: WHITTAKER and Co.: sold by all Booksellers.

One Volume, price 7*s.* 6*d.*

THE LIFE AND TIMES OF RIENZI.

Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to be more acquainted with the true history of a man, who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: WHITTAKER and Co

PRINTED FOR

TAYLOR AND WALTON,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE.

UPPER GOWER-STREET.

DARLEY'S SCIENTIFIC LIBRARY,

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

SURPRISING EFFICACY of "PARR'S LIFE PILLS."

Testimonial just received by the Hibernia from America.—Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn, L.I.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion; her bowels were sometimes constipated, and at other times lax, and never regular. At this period, she was recommended to try PARR'S LIFE'S PILLS, when, no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.—Yours truly,

To T. Roberts & Co., April, 1844. C. STEANE.

These and hundreds of other cases of decided cures, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine vendor's. The cures in many instances were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of spurious imitations of the above Medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the fac-simile of the signature of the proprietors, "T. ROBERTS & Co., Crane-court, Fleet-street, London," on the directions.

GLASS CHANDELIERS FOR DRAWING-ROOMS.—APSLEY PELLATT (late Pellatt and Green), Falcon Glass Works, Holland-street, Blackfriars, has recently constructed a NEW CHANDELIER (Registered), which surpasses in brilliant and refractive effects all former efforts, to which he invites inspection. Renaissance and other Glass Chandeliers as usual at low prices, which, when lighted, have a far more resplendent effect than buhl. TABLE CUT AND ENGRAVED GLASS at the Printed List of Prices, subject to an extra discount for Cash. The manufactory and steam-cutting works may be seen any Tuesday, Wednesday, or Thursday. Merchants' orders and outfits for Glass and China on the very lowest terms. No connexion with any house in the City.

PRESERVES and CONFECTIONERY.—The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home-made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18s. per Gallon, exclusive of the price of the Jar; and in Glass Bottles, at 20s. per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, JUN., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

POTTS'S PATENT for HANGING PICTURES.—"Artis est celare artem."—It is seldom that this desideratum is so successfully carried out as in the above Invention, by its combining an Architectural Cornice Moulding with means to suspend the largest Pictures. Specimens at Mr. NOTTINGHAM'S, 6, St. Bene't-place, Gracechurch-street.

INTERESTING TO LADIES.—To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

**** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

This Day is Published, Price One Shilling,

A LECTURE ON INSTITUTIONS FOR THE BETTER EDUCATION OF THE FARMING CLASSES, especially with reference to the proposed Agricultural College near Cirencester, with some remarks on Experimental Farms, and on the class of inquiries for which they are more particularly designed, delivered at the Botanic Garden, Oxford, on Tuesday, May 14, 1844. By CHARLES DAUBENY, M.D., F.R.S., &c. Honorary Member of the Royal Agricultural Society of England, and Professor of Rural Economy at the University of Oxford.

Oxford: Printed by THOMAS COMBE, Printer to the University. Sold by JOHN HENRY PARKER; and JOHN MURRAY, Albemarle-street, London. 1844.

In 8vo, boards, with very numerous woodcuts, price 10s. 6d.,

LINDLEY'S ELEMENTS OF BOTANY,

A PRACTICAL ESSAY and Rules for the Application of Guano, as a Manure for all Soils and Crops; its important use and results, including the Greenhouse and Kitchen Garden, also the mode of applying the same for Wheat Sowing; being a protection against all insects, wireworm, and mildew, a saving of one-eighth part of seed, crop earlier at maturity, an increase of grain and straw with less labour, and one-third less cost than by bones or farmyard manure. To be had of the Author only, by letters prepaid, inclosing 1s.; if posted and paid, 1s. 4d, by addressing J. H. SHEPPARD, City of Chester.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 6, 1844.

The Newspaper.

SATURDAY, JULY 6, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, (Instituted in 1805), New Bridge-street, Blackfriars.

BONUS every THREE Years. Eighty per cent. or Four-fifths of the Profits returned on Policies effected after the 1st of May, 1844.

The new Prospectus, containing a full detail of the highly advantageous Terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

EDWIN CHARLTON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, Waterloo-place, London.

Directors.

The Chisholm, Chairman.
William Morley, Esq., Deputy Chairman.

John Brightman, Esq. | James John Kinloch, Esq.
Francis Brodigan, Esq. | Henry Lawson, Esq.
James William Deacon, Esq. | Robert Power, Esq.
Jonathan Duncan Dow, Esq. | The Rev. F. W. Johnson Vickery, A.M.
Alexander Robert Irvine, Esq.
John Inglis Jerdein, Esq.

Auditors.—C. B. Rule, Esq.; T. C. Simmons, Esq.; George Thomas, Esq.

Physician.—John Clendinning, M.D., 16, Wimpole-street.
Solicitor.—Walter Prideaux, Esq., Goldsmith's Hall.
Bankers.—Union Bank of London.

ADVANTAGES OF THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security to the Policy-Holders.

Credit given to Members for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay, and after payment of the arrears the party will become entitled to participate in the entire profits of the Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance, in the usual way.

Thus, for example—a person in the 25th year of his age, instead of paying 2*l.* 6*s.* per annum for an Assurance of 100*l.*, would be required to pay 1*l.* 3*s.* only during the first five years, when, on payment of the arrears of Premium, amounting to 5*l.* 15*s.*, his share of the Profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 1*l.* 3*s.* originally paid by him. The GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members, to be specially convened on the occasion.

Members Assured to the extent of 1000*l.* entitled (after payment of five Annual Premiums) to attend and vote at all General Meetings, which will have the superintendence and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, Managing Director.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of MESSRS. B. AND M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall Mall East.

JOHN KING, Actuary.

News of the Week.

THE opening of letters at the Post Office, under the warrants of the Secretary of State, is still the leading topic of the day. The subject has been again discussed in both Houses of Parliament on the motions of Lord Radnor and Mr. T. Duncombe, for the appointment of select committees to inquire into the facts. The Government, on these occasions, no longer entrenched themselves behind the powers of the law, but at once concurred in the appointment of committees, on the condition that they were secret. In the Commons it was also stipulated that the Committee should include no person who had at any period been a Minister of the Crown, or had practised at the bar; Mr. Duncombe as the accuser, and Sir J. Graham as the accused, being equally excluded. It was agreed in both Houses that the inquiry should not be confined to the recent instances, but should embrace the period during which the Whig Ministry were in office, and include the Irish as well as the English Post Office. The members of these Committees were then appointed, the majority in each case being chosen from the Opposition benches. During the discussion in the Lords, the Duke of Wellington said more in reference to the late events than had previously fallen from any other Minister. He intimated that the warrants by which the letters of Mr. Mazzini and others were detained, had been issued in order to arrest the progress of a conspiracy which, according to representations received from the Austrian Government, was maturing between foreigners resident in London, and others at Malta and Corfu. The object of this conspiracy was to attempt an insurrection in Italy, by collecting a force in the Ionian Islands, and landing on the Calabrian coast; and our Foreign News this day shows that the attempt has actually been made. The Duke of Wellington is understood to have intimated, that on receiving a representation on this subject from the Austrian authorities, our Government determined to use every effort to check a conspiracy, of which the first blow was to be struck from a British dependency, and against a friendly Power. Lord Aberdeen, however, distinctly assured the House that no portion of the correspondence examined had been shown to any foreign government whatever. The Sugar Duties and other Bills received the Royal assent on Thursday. In the Lords on Monday, Lord Brougham's Privy Council Bill passed through committee, that portion of it which related to the law of divorce, and to the appointment of a Vice-President and Puisne Judges being omitted. The Bill introduced by Lord Powis to prevent the union of the sees of Bangor and St. Asaph has been met by Government with an objection which will probably be fatal to it. It appears from the report of a committee specially appointed by the Lords, that there is no precedent for passing a Bill affecting the regulation and revenues of the Church, without the consent of the Crown, and this consent Ministers will not advise Her Majesty to grant. The question, however, will not be finally decided until the committee report on another point referred to them for inquiry—viz., whether the Bill belongs to that class of measures for which it has been the usage to give the consent of the Crown. In the Commons, Ministers have adopted the plan of morning sittings in order to get through the press of business at this late period of the Session. The Dissenters' Chapels Bill passed on Friday by a majority of 120, and the Bank Charter Bill passed on Thursday without a division. The Joint Stock Companies Bill has gone into committee, an amendment moved by Mr. Hawes that the Bill be committed that day six months having been withdrawn. The House on Thursday, after a long discussion, went into committee on the Poor Law Amendment Bill by a majority of 199 to 19. An attempt to obtain an adjournment had been previously negatived by a large majority, Sir R. Peel having threatened to drop the Bill if the House did not allow it to go into committee; but notwithstanding the result of this division, and of the subsequent one on the main question, no further progress was made.

An intermediate Overland Mail has arrived this week from India. The Punjaub is more disturbed than ever, and another bloody conflict has taken place, the only result of which is to exasperate the animosity of the different pretenders to the throne. In Scinde, Sir C. Napier was preparing for the great meeting of the Beloochee chiefs, after which it was expected that he would accompany Lord Ellenborough on an expedition for the conquest of the Punjaub. The news from China adds nothing to the accounts brought by the last arrival.—In France, great excitement has been occasioned by the publication of a semi-official article by the Court party, asserting the right of the House of Orleans to separate dotations from the State, in direct opposition to the resolution of the Chambers in a late discussion on the subject. The Cabinet have been questioned on the subject, but with no other effect than to strengthen the rumour that the article proceeded from the King himself, and at the same time to show the hostility of the country at large to such a measure. Important despatches reached the French Government on Wednesday, announcing the entry of Marshal Bugeaud into the town of Ouchda, on the 19th ult., without a shot being fired, the Morocco troops having evacuated the place two days before. A Moorish Chief had asked previously for a conference with the Marshal, and appeared disposed towards a pacific arrangement. At this period, however, the Marshal had not received instructions from his government, acquainting him with the views of the Cabinet, nor was he aware of the fact of the departure of the Prince de Joinville with the fleet under his command.—From the United States, we learn that President Tyler's proposal for the annexation of Texas has been rejected by the Senate, and that the measure is now before Congress, where it will probably meet with a similar fate.

Home News.

COURT.—The Queen and Prince Albert, with the Prince of Wales and the Princesses, left town on Saturday for Claremont. On Sunday morning Her Majesty and suite attended divine service in the private chapel, and in the afternoon Her Majesty took an airing in the vicinity of Claremont in an open pony phaëton. On Monday the Queen and Prince Albert walked on the lawn and in the gardens of the Palace: the Prince afterwards rode out on horseback. On Tuesday Her Majesty and the Royal family returned to Buckingham Palace, and in the afternoon of the same day the Prince presided at a meeting of the Fine Arts Commission. On Wednesday the Queen and Prince walked in the gardens of Buckingham Palace. The Prince afterwards rode out on horseback, and Her Majesty had a dinner-party and a concert in the evening. The Queen and Prince also took their usual exercise on Thursday, and in the afternoon took an airing in an open carriage.—Viscountess Jocelyn has succeeded the Marchioness of Douro as Lady in Waiting. The Hon. Miss Liddell and the Hon. Miss Paget have succeeded the Hon. Miss Devereux, and the Hon. Miss Lister, as Maids of Honour in Waiting. The Earl of Morton and the Hon. Capt. Hood have succeeded the Earl of Warwick and Capt. Meynell as Lord and Groom in Waiting. Colonel Buckley has succeeded Colonel Arbuthnot as Equerry in Waiting to the Queen; and Colonel Bouverie has succeeded Major-Gen. Sir E. Bowater as Equerry in Waiting to Prince Albert.—The Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz landed at Dover on Thursday, where they were met by the Duke and Duchess of Cambridge. The royal party left Dover by the South Eastern Railway, and arrived at Cambridge House in the evening.

THE KING OF SAXONY.—His Majesty, during this and the last week, has been visiting with great rapidity several of our provincial cities. After his visit to Cambridge, the King, on Saturday week, reached Chesterfield, and examined its extraordinary steeple, which appears crooked at every point of view. He drove on to Hardwicke Hall, and thence to Bakewell, where he slept. To Chatsworth on Sunday, several hours being spent in the Conservatory; thence to Haddon Hall, one of the seats of the Duke of Rutland; to Buxton and the Peak (Castleton and its caves) on Monday. A view of Matlock and the High Torr, on Tuesday; a peep at the old lead mines worked by the Romans, and a view of the petrifying well. To Birmingham on Wednesday, the first place visited being Boulton and Watt's great manufactory at Soho. Thence to Leamington in the evening, visiting Kenilworth, Guy's Cliff, and Warwick Castle on his way. On Thursday morning, after walking over the town, His Majesty proceeded to Stratford-upon-Avon and Blenheim, and arrived at Oxford in the evening. On Friday morning he began to inspect the different places for which Oxford is so much celebrated. He was attended by the Vice-Chancellor only, as His Majesty declined everything that would tend to his recognition as a Sovereign. Besides visiting Christ Church, the Botanic Garden, the Bodleian Library, Radcliff's Library, the Theatre, Divinity School, Clarendon Printing Office, the Martyr's Memorial, the new building called the Taylor and Randolph Galleries, &c., the King went to many of the colleges, and spent a short time in the schools, where some under-graduates were under examination, performing the "Responsions." His Majesty afterwards honoured the Vice-Chancellor with his company to lunch, at St. John's College, from whence he set out on a visit to the Duke of Buckingham at Stowe, returning to Oxford in the evening. On Saturday his Majesty went to Salisbury, and visited the Cathedral and Stonehenge. On Sunday evening the King arrived at Weymouth, where he slept; and on Monday, after taking a walk on the esplanade, his Majesty set out on his western tour; in the first instance visiting Lyme Regis, for the purpose of examining that classical field of English geology. The King then proceeded by Exeter and Torquay to Plymouth, and on Wednesday examined the royal dockyard at that port. His Majesty is said to have abandoned his intention to visit Scotland.

Diplomatic Appointments.—Mr. Peel, eldest son of the Premier, has gone to Lisbon, and thence by Cadiz and Gibraltar to Madrid, where he is appointed Secretary to the British Embassy, under Mr. Henry Bulwer. It is said that Mr. Peel will remain for two years in Spain. Mr. Clark, only son of Sir James Clark, Physician to the Queen, has been appointed *attaché* to the Embassy at Vienna.

Parliamentary Movements.—A vacancy has occurred in the representation of Birmingham by the death of Mr. Scholefield. The hon. gentleman was seized with paralysis a few days since, and died on Thursday, at the age of 70.

Order of the Bath.—Her Majesty has been pleased to confer the Grand Cross of the Bath on Sir Edmund Lyons, Bart., as an especial mark of her Majesty's approbation of his services as Minister at the court of Greece.

The Revenue.—The Quarter's Revenue was made up last evening, and we believe it will prove favourable. In

the Excise, it is understood there will be an increase on the quarter of about 80,000*l.*, and on the year of nearly 400,000*l.* In the Customs, it is expected there will be an increase of 200,000*l.*; the Stamps and Tax department will be nearly the same as in the corresponding quarter of last year. There is a small increase in the Post Office returns. There will be a slight deficiency under the head of Miscellaneous Taxes, on the quarter, as compared with the corresponding quarter of last year, in consequence of the remittances of silver from China coming into the account of last year, and the remittances recently received in this country not coming into the revenue account until next quarter. On the year and the quarter it is expected that the report will be favourable, but the details of the returns cannot be given until next week.

Foreign.

FRANCE.—The expedition against Morocco, and the discussion on the Railway Bills, have been thrown into the shade this week by the excitement produced in all classes in Paris, by an article in the official *Moniteur*, said, by some, to be from the King's pen. This article relates to the private property of the House of Orléans, and is intended to show the right of the younger members of that family to a dotation from the State. On Louis-Philippe's elevation to the throne, the *apanage* which he had inherited from his ancestors was, in virtue of the Royal ordinance that had constituted it in favour of the brother to Louis XIV. and his male heirs, annexed to the domain of the Crown. Taking this into consideration, the Chambers resolved, in 1832, that "in case the private domain should be insufficient, the dotations of the younger sons of the King and of the Princesses, his daughters, should be fixed at a future period by special laws." The article then proceeds to demonstrate the impossibility of providing out of the private domain for the maintenance of the Royal family. When Louis-Philippe came into possession of his father's property as Duke of Orléans, he found it encumbered with debts to the amount of 31,000,000f., and the assets did not exceed 16,000,000f. By applying thereto a portion of the revenues of his *apanage*, which were protected from the effects of any legal process, His Majesty had been able to effect a settlement, which still burdens his private property. The King was at one time so much embarrassed, that, in order to meet the expenses of his crown and family, he was actually obliged to pawn his title-deeds to the canals of Orléans and Loing, which had been constructed by the Regent Duke of Orléans at his own expense. The five millions which he received in 1825 as an indemnity for the property confiscated during the revolution, were entirely appropriated to the completion and embellishment of the Palais Royal, which, forming part of the *apanage*, had been incorporated with the Crown estates. The writer then observes, that no personal prodigality occasioned any derangement in the administration of the civil list or the private property of the King; that Princess Adelaide, his Majesty's sister, was often obliged to afford him assistance; and that the King, to satisfy the obligations imposed upon him as a Sovereign and a father, had been, and was still compelled to contract debts which daily encumbered his private property, at present the sole patrimony of the Princes and Princesses his children. "Such a state of things," he says, "is contrary to the principles of justice and sound policy, as well as to the dignity of the country and Crown. According to strict law, and to the provisions of our legislation, dotations are due to the younger Princes and Princesses of the Royal Family, for the private property is inadequate for the purpose. In order that this grave question may be suitably submitted to the examination of the Chambers, good citizens and all just and sensible men must be enlightened as to the truth of the case, and assist themselves in clearing that cloud of gross errors and perfidious falsehoods so carefully raised to deceive the country with regard to rights and facts. It was often said in France, 'If the King knew it.' The King's Government says now, 'Let the country know it!' France will not permit that the Royal family should not preserve, under our constitutional monarchy, the rights and station legally guaranteed to the family of the Duke of Orléans." Nothing can exceed the excitement produced by this article. On Monday the Chamber of Deputies was crowded, in expectation of Ministers being questioned regarding it. The questions were put by M. Lherbette, who expressed his amazement at such a thing having been published. M. Guizot replied that the Cabinet assumed the responsibility for what was inserted in the *Moniteur* by order of the Government: that he had said two months ago in the Chamber of Peers, all that had now been published in the official print; that abundant calumnies had been spread relative to the "dotation" of the Royal family; that those calumnies must be dispelled; that when the public mind was set right on the subject, the Government would bring the question in due form before the Chambers, but that it would not, before that period, risk a great monarchic question. M. Guizot was interrupted by considerable clamour, and expressed his astonishment, asking whether it behoved not a Government to dispel public errors before matters of moment were introduced into the Legislature. M. Lherbette again insisted upon the offensiveness of the article and the painful dissension it had made in Paris, and M. Guizot reiterated his first observations. M. Dupin censured the article as unconstitutional, and astounded his hearers by saying he did not consider the article as emanating from the King. If the dotation was necessary, the Ministry ought to come forward frankly and demand it. But to appeal to opinion against past acts of the Chamber, without asking the Chamber to reconsider and decide it, was to try to pass questions over the head of the Chamber. The article had excited too much attention, and he would propose the order of the day. This was carried, and the discussion terminated, as a matter of course.—The recent disclosures in our House of Commons on the opening of letters by the Post-office, have been brought before the French Chambers by M. de Malleville, who urged that Mr. Duncombe had publicly stated that the practice was carried on in France. M. de Malleville added that Mr. Duncombe's allegation had been published in the *Moniteur* without any contradiction being given to it, and that it behoved the Government publicly to declare that the secrecy of letters was respected in France, the revolution of 1830 having, to its honour, abolished the "Cabinet Noir." M. Guizot replied that M. de Malleville was quite justified in calling the attention of Ministers to the circumstance—that, both *de jure* and *de facto*, the secrecy of letters was completely respected in France—that it was respected as regarded both Frenchmen and foreigners; and, lastly, that nobody could deem it the Government's duty to notice all the mistakes that might be committed in England and elsewhere. On this subject the *Journal des Débats* declares, "that all persons acquainted with political matters are well aware that the custom of opening letters has ceased to exist in France since the revolution of July, and that it will never be re-established." The *Courrier Français* is indignant that the French Ministry did not come forward and contradict, of its own accord, the charge made against France. The *Constitutionnel* alludes to the subject in these words:—"M. Guizot declared, that in fact and in right, the secrecy of letters was completely respected in France. The fact regards the Ministry, and until proof to the contrary, we hold the Minister's affirmation to be exact. But as to the right, notwithstanding the temporary attacks that it has received, in times when all guarantees were in danger, it exists for every citizen, from the day when the Constituent Assembly unanimously proclaimed it. As long as there shall be in France a free press and tribune, this right cannot be violated with impunity." The *Commerce* alludes more particularly to the existence of such a system in England. "It is," it says, "truly astonishing that in our days, and in a country of liberty and political guarantees like England, such a thing could take place. The Tory Ministry seeks in vain to excuse itself by arguing on a system of legislation created at an epoch so different from the present. In disinterring all the Draconian enactments and laws of the moment that the political archives of England contain, nothing could be more easy than to establish tyranny according to law. The House of Commons ought to render homage to public morality, by modifying a legislation which the Tories abuse in a manner worthy of their retrograde system, and of which the slightest effect is to excite the indignation of all honourable men."—Official advices from Algiers were received on Wednesday, announcing the entry of the French troops into the territory of Morocco, and the occupation of the town of Ouchda.—The discussion on the Paris and Belgian Railroad Bill in the Chamber of Deputies was brought to a close on Friday, the Bill having been carried by a majority of 227 against 42. This important railroad runs from Paris to Douay, by Clermont-sur-Oise, Amiens, and Arras. From Douay two branch lines are to run to the Belgian frontier, the one by Valenciennes towards Mons, and the other by Lille towards Courtrai. In Thursday's sitting it was decided that a branch line should run from Lille to Hazebrouck, whence two other branches should run, the one to Dunkirk, and the other to Calais. Boulogne is a great gainer by the vote, as that place will communicate with Paris by the far more direct line of Etaples, Abbéville, and Amiens. On Saturday the Chamber of Deputies passed the Central Railway Bill by a large majority. The railway authorised by this Bill is from Vierzon to Bourges, with branches from Vierzon by Chateauroux to Limoges, and from Bourges to Clermont. On Monday the Montpelier and Nismes Railway Bill was passed by a majority of 95 to 5. Count Molé availed himself of that opportunity to protest against the clause inserted in the Tours and Bordeaux Railroad Bill by the Chamber of Deputies, which excluded members of both houses from all participation in railroad companies. He declared that in placing himself at the head of the Strasburgh Company, he conceived he was doing a patriotic act; but that his intentions having been misrepresented, he had resigned, with the firm determination to abstain hereafter from all interference in such enterprises.—On Wednesday the Paris and Strasburg Railway Bill was adopted by 191 to 62.—The Archbishop of Paris was on Tuesday sent for to Neuilly to be ready to baptise at the proper moment the infant of the Duchess of Nemours, whose accouchement is hourly expected.—A trial commenced last week at the Paris assizes, long reports of which are given in the papers. It appears that in January last, M. Donon-Cadot, a banker, of Pontoise, was murdered in that town; that a considerable sum in money and bills was stolen from his house; that the murderer, a man named Rousselet, has since declared that he committed the crime, but was long exhorted, and ultimately bribed to perpetrate it by the murdered banker's second son, a youth not 19 years of age. Various mysterious circumstances, and some episodes of revolting immorality have increased the dramatic attractions of this trial; and the *Gazette des Tribunaux* declares, that among all the criminal proceedings recorded in the annals of justice, few have excited public curiosity to such a degree. The Court of Assizes was almost stormed by the crowd who surrounded it long before its doors opened. Upwards of a hundred elegantly dressed females rushed to the seats for which they had secured tickets, and many more, who had none, were not compelled until threatened with actual coercion. The trial did not terminate until Wednesday last, when Rousselet was found guilty on every charge, but with "extenuating circumstances." He was sentenced to hard labour for life, and young Cadot was acquitted.

SPAIN.—Accounts from Madrid of the 25th ult. have come to hand. Tranquillity prevailed in the capital, although various military precautions denoted that the authorities apprehended some disturbance. Public attention was directed towards Barcelona, and all letters from that city were anxiously sought for, innumerable rumours as to an impending demonstration being daily propagated. The official prints labour to appease the general uneasiness, but their language betrays their belief that some political event of great moment will soon be heard of.—It is said in the latest accounts from Barcelona, that after frequent ministerial consultations, the Constitutional party in the Cabinet has triumphed, and that the Cortes will be convoked immediately, to take into consideration the Government measures, by which its constitution is proposed to be changed.

PORTUGAL.—Advices from Lisbon of the 26th ult., give an account of the probable resignation of the Minister of Justice, of serious embarrassments arising from the prorogation of the Cortes, and a disposition to take advantage of that ill-judged measure—the supplies not having been granted and the estimates passed—to refuse the payment of taxes. The case of the woman said to be accused of apostacy and heresy, and sentenced to death, appears to have been referred to the Court of Relaçao of Lisbon. The money difficulties of the Government continue, and wear a very gloomy aspect.

SWITZERLAND.—The Helvetic Diet was opened on the 25th ult. by the President of the Directory, M. Muller, who delivered on the occasion a speech exclusively devoted to the recent occurrences in the Valais. He particularly applied himself to justify the course pursued by the Government throughout the affair, and stigmatised in energetic terms the attempt of the partisans of Young Switzerland, "who," he said, "knew no other justice than violence, no other religion than licentiousness, who had no root in the country, and were overthrown by the whole population rising against them." After this speech, which was favourably received by some and disapproved by others, the Assembly rejected by a large majority the proposition of the member for Basle country, that the deputies of Valais be excluded from the extraordinary Diet.

GERMANY.—The *Augsburg Gazette* states, from Goritz, that the Duc de Bordeaux has notified to the Courts of Europe his determination to retain the title of Count de Chambord. This is said to be for the purpose of avoiding the alternative of accepting or refusing the title of King of France, which his partisans have given to him since the death of the Duc d'Angoulême.—It is stated, in a letter from Berlin of the 22d ult., that the King has ordered the factories which were destroyed in Silesia to be rebuilt, and that occupation shall be immediately found in some way or other for the workmen. The same letter mentions a striking instance of religious toleration. The Protestant ministers of Berlin have offered the use of their churches to the Catholic clergy until there shall be a sufficient number of Catholic churches to accommodate the persons of that religion.—A Prague letter of the 20th ult. says:—"For three days past we have had a little rebellion among the operatives. Three thousand of the workmen employed in our cotton factories have struck work, and destroyed the machinery in some of the factories. Measures have been taken to maintain order, and it is hoped that the want of the means of subsistence will soon compel the workmen to return to their duty."—It is stated that the late riot at Breslau, when most threatening, was brought to a close by an unexpected circumstance, which excited the mirth of the crowd. The following proclamation suddenly appeared in various parts of the town:—"The revolution cannot be continued, in consequence of the sudden hoarseness of the journeymen bootmakers!" This pleasantry immediately put a stop to the proceedings.

ITALY.—A supplement of the *Journal of the Two Sicilies* of the 22d ult. announces that several Italian refugees, who had fled to Corfu, embarked on the night of the 13th for Italy, and landed on the 16th on the coast of Calabria. The party was commanded by the two sons of Admiral Bandiera and Domenico Moro, all officers in the Austrian navy. They marched three days into the interior, without encountering any opposition, under the guidance of a man whom the Neapolitan journal designates as a Calabrian bandit. On the 19th, however, they were attacked, near Belvedere, in the province of Catanzaro, on the road to San Giovanni in Fiore, which leads to Cosenza. The commander of the Urban guard and one of the gendarmes opposed to them, were killed in the action, and the rest fled to San Giovanni. The insurgents continued their march upon that town, but when within four miles of it they were attacked, at a place called Canale della Strangola, and, according to the Neapolitan report, completely routed, with 3 killed, 2 wounded, and 14 taken prisoners. The Government, on being apprised of those events, immediately embarked a battalion of chasseurs for Paola, whence it was to advance in two columns upon Catanzaro, the one passing through Cosenza, and the other through Pizzo. The great object of the revolters was, it appears, to liberate the prisoners implicated in the late rebellion, who were detained at Cosenza. They had hoisted the tri-coloured flag, and issued a great number of proclama-

throughout the country.—A letter from Rome states that the Pope is about to canonize the late Princess Borghese, the daughter of the Earl of Shrewsbury, who died four years ago. She cannot, however, be recognised as a saint until a century has elapsed from the time of her death.—The King and Queen of Naples arrived at Malta on the 24th, on their voyage to Lampedusa, and were received with the usual honours by the naval and military authorities. The Grand Duke of Mecklenburgh Schwerin and the Hereditary Prince of Hesse had previously visited the island, and gone to Sicily.

TURKEY.—Letters from Constantinople of the 17th ult. state that the Sultan returned to that capital in the morning of the 10th. The news from Albania continued to be favourable. The rebels, discouraged by their late defeats, and the capture of the principal chiefs and promoters of the insurrection, had dispersed in every direction, and the Ottoman army was then in complete possession of the country. Several of the chiefs had arrived at Constantinople in the last steamer from Salonica, and were confined in the prisons of the Seraskier, until the Supreme Council of Justice should have pronounced on their fate.

INDIA AND CHINA.—An intermediate mail has arrived with accounts from Bombay to the 20th, and from Calcutta to the 11th May, from Macao to the 10th, and Hong-Kong to the 8th April. The mail from England of the 6th April, reached Bombay on 12th May. The principal intelligence relates to the state of the Punjaub, which appears now to be more distracted than ever. A bloody fight is stated to have taken place on the 7th May, between Heera Singh, the present Prime Minister, and the party of the sons of Runjeet Singh, who are opposed to him, led on by Ittur Singh, a chief of considerable influence. In September last, when Ajeet Singh had murdered the then King, Shere Singh, and the Prime Minister Dhyan Singh, he was himself slain in a fight with Heera Singh, who avenged the death of his father Dhyan, by ordering all the family of Ajeet to be butchered. One boy of nine years was allowed to live, and an uncle, named Ittur or Utter Singh, escaped into the Sikh states, protected by the British. After seven months' residence, he went back on the 30th April, and joined the party under Cashmeera Singh and Peshora Singh, both sons of old Runjeet Singh. They proceeded to attack Heera Singh, and a bloody conflict took place, in which Heera was said to have been wounded. Ittur Singh was considered by some of the partisans of Heera as being supported by the British, and they therefore have threatened to invade the territories of the latter, to revenge themselves on those who had countenanced the proceedings of Ittur Singh. The threatened movement of Ackbar Khan on Peshawur had not taken place. The position of his father, Dhost Mahomed, was by no means satisfactory; his age, infirmities, and the complicated state of the affairs of Cabul would, it was thought, induce him to resign his sovereignty into the hands of Ackbar. The news from Scinde extends to the 16th May. Sir C. Napier was busy in making preparations for the meeting of the Beloochee chiefs, which was to take place on the 24th May, when it is said that upwards of 17,000 of them would attend, each having an unarmed attendant. Thirty thousand men assembled to deliberate would present an odd appearance. The disturbed state of the Punjaub is calculated to hasten the movements of the British Indian armies in that direction. The attempts lately made to corrupt the fidelity of the British sepoys, and the large sums sent to Ferozepore and its vicinity (170,000*l.*), have excited a strong wish for punishing the unprincipled chiefs of Lahore. The large force of 80,000 men was therefore ordered, and it was thought Lord Ellenborough and Sir C. Napier would undertake the conquest of the Punjaub, the former as a diplomatist and a politician, and the latter as a general.—The direct news from China comes down to the 26th March, but adds nothing to the facts already known. Further intelligence had been received at Bombay from China, just before the departure of the mail, by way of Calcutta. It is to the 10th April, but is still destitute of political news.

CAPE OF GOOD HOPE.—Accounts from the Cape received this week allude to the new trade in guano which is now occupying the attention of the colony. It would appear by a letter dated April 9, from Ichaboe, one of the guano islands near Angra Pequena, that the trade in that commodity was brisk and extensive, no fewer than 37 vessels being at the time loading at one of the islets. A number of natives from the main land had just come on board for the first time, being about 20 in number, and in appearance very wretched. There was a talk of gold dust, or ore containing gold, being found on these islands, and considerable quantities of such property were said to have been shipped by some of the masters of vessels. The guano was, however, the merchandise principally looked to. One of the Cape publications dwells strongly on the subject of the newly introduced traffic in this quarter. The guano business is thought to be capable of doing much for the mitigation of the slave-trade, which still exists on the south-west coast.

UNITED STATES.—The Caledonia steam-ship has arrived with news from New York to the 15th ult. President Tyler's proposal for the annexation of Texas was, as expected, rejected in the Senate, the nays being 35, the votes for it but 16. To explain their decision, and inform the public of their motives, the papers furnished by the President were ordered to be printed and distributed, to the number of 20,000 copies. From these documents it appears that the Texian statesmen refused to sign the treaty of annexation till they had obtained from President Tyler, not only a promise to defend Texas in case of an expedition from Mexico, but the actual march of troops and dispatch of fleets. A message from the President on the subject had been sent to Congress, stating the part he had taken, commenting on the observations of Lords Aberdeen and Brougham in the House of Lords on the subject, and calling on the House to adopt steps to procure annexation. The message was moved to lie on the table, but the motion was rejected by 118 to 66.—The President in his message alluding to Lord Aberdeen's speech, says, "That a kingdom which is made what it now is by repeated acts of annexation, beginning from the time of the Heptarchy, and concluding with the annexation of the kingdoms of Ireland and Scotland, should perceive any principle either novel or serious in the late proceedings of the American Executive in regard to Texas is well calculated to excite surprise. If it be pretended that because of commercial or political relations which may exist between two countries, neither has a right to part with its sovereignty, and that no third power can change those relations by a voluntary treaty of union or annexation, then it would seem to follow that an annexation to be achieved by force of arms, in the prosecution of a just and necessary war, could in no way be justified; and yet it is presumed that Great Britain would be the last nation in the world to maintain any such doctrine. The commercial and political relations of many of the countries of Europe have undergone repeated changes by voluntary treaties, by conquest, and by partitions of their territories, without any question as to the right under the public law. The question, in this view of it, can be considered as neither serious nor novel." Several resolutions had been proposed to Congress by Mr. Adams and others, but nothing final had been decided.—An arrival from Hayti announces that President Herard had been deposed, and that Guerrier Duc de Christophe was set up, and had a strong party.

NEW ZEALAND.—We have received accounts from this colony to the beginning of February. The *New Zealand Gazette* of Feb. 3d alludes to the proceedings of the new Governor, and states that his Excellency continues to give the utmost satisfaction. It says that "despair and indignation have been converted into hope and confidence, and we now rest assured we may now safely predict our new Governor's career will be alike advantageous to the colony of New Zealand, and creditable and satisfactory to himself. We have been informed that his Excellency proceeds this day in H.M.'s ship North Star to Nelson, and that after a short stay there he will return to this place, from which he will not again depart until the land question in this settlement is rendered satisfactory. From all we hear, all the subjects connected with the vital question, the land matter, are likely to be arranged immediately, and in a manner equally advantageous to the settlers in New Zealand, and their friends in England. We really believe the colonists may now look forward with confidence to that success, the anticipation of which induced them to abandon England, and make New Zealand their home."

Parliament.

HOUSE OF LORDS.

Friday.—The discussion on the Post-office, of which we gave a portion in our last, was terminated by the Duke of WELLINGTON, who advised that as Lord Radnor intended to bring the question forward in a substantive motion, that the debate should be postponed to that time.—The Earl of RADNOR then gave notice for Tuesday of a motion for a committee of inquiry.—The Earl of WINCHELSEA, in order to keep the price of corn steady, and to put down the agitation on the Corn-laws, suggested the establishment of national granaries throughout the country.—Lord MONTEAGLE considered the suggestion, and the speech by which it was accompanied, to be the strongest arguments he had ever heard against the sliding scale.—The Duke of RICHMOND said, in his opinion, such a speech as had been recently made by Sir R. Peel, was worth all the granaries they could establish. The only thing the agriculturists wanted was an entire confidence in the permanency of the law. If they wanted to prevent scarcity, all they had to do was to continue the course which they were now pursuing—that was, to continue getting majorities of 204 against an alteration in the Corn-laws.—The Dissenters' Chapels Bill was brought back from the Commons.—The Charitable Bequests (Ireland) Bill passed through committee.—The Parishes (Scotland) Bill, and the County Rates Bill were read a second time.

Monday.—The Sugar Duties Bill was read a second time, and Lord Brougham's Privy Council Bill passed through committee, that portion of it which related to the law of divorce and to the appointment of a Vice-President, and to Puisne Judges, being omitted.—Lord BROUGHAM assured their lordships that he never had the remotest idea of securing to himself any one of these appointments.—The Earl of POWIS moved the third reading of his Bill to repeal that portion of the Act which provides for the union of the sees of Bangor and St. Asaph.—Lord VIVIAN opposed the Bill, because he believed that neither the people nor the clergy of Wales cared whether the two bishoprics remained separate or were united, their only desire being that their revenues should not be diverted from Wales to the much richer district of Manchester.—The Bishop of BANGOR, on the contrary, maintained that the people and clergy were unanimous in desiring the passing of this Bill; he therefore gave it his cordial support.—The Duke of WELLINGTON stated the course the Government had resolved to take with respect to this Bill. He said it affected the prerogative of the Crown in a most important point—one touching the regulation and revenues of the Church—and therefore that it specially required the consent of her Majesty to its discussion. He called on the Right Rev. Bench, however favourable they might be to its passing, to reflect of how much greater importance the preservation of the strict rule requiring the consent of the Crown to such measures would be to the interests of religion than the carrying of this Bill. A precedent for dispensing with the consent of the Crown in such a case would much more than counterbalance the advantage of maintaining the separate sees of Bangor and St. Asaph. Having explained his formal objections to the further progress of this Bill, his Grace said there were some important arrangements pending on the words of the Act of Parliament which it was the object of the present Bill to repeal. First, there was the establishment of the diocese of Manchester; next—a very important measure—the augmentation of the revenues of the sees of St. David and Llandaff; next, the establishment, under orders in Council, of archdeaconries; and likewise of a provision for the parochial clergy in those dioceses. These things her Majesty had the power, under orders in Council, to carry into execution. All these arrangements were depending on the very words in the Act which the present Bill proposed to repeal, and in order to obtain machinery in substitution for that repealed, this Bill should go down to the House of Commons. In conclusion, his Grace said he had not authority to give her Majesty's consent, and on that ground alone he intreated the Right Reverend Prelates to withdraw their support and let the Bill drop. He did not mean again to take the sense of the House upon it. If their lordships and the Right Reverend Bench thought proper to pass it, on them he threw the entire responsibility.—Lord MONTEAGLE moved that the Bill be read a third time that day six months.—The LORD CHANCELLOR doubted whether he could put the question of the third reading of the Bill, because it affected not only the prerogatives but the pecuniary interests of the Crown. He had no doubt that the previous consent of her Majesty was requisite, and suggested the appointment of a committee to search for precedents, and in the meantime the adjournment of the debate.—The Duke of RICHMOND thought no doubt existed that the Bill could be read a third as well as a second time, though on the question that it do pass difficulty might arise. He was ready to vote for the third reading, and if, after due search, they found a precedent for passing such a Bill without the consent of the Crown, he was not prepared to give up the privilege of the House.—The Duke of NEWCASTLE accused the Lord Chancellor of having been guilty of an unworthy manœuvre in the course he had taken.—The LORD CHANCELLOR insisted that the doubt of his propriety in putting the question had arisen with his own mind, and not in concert with others. "The expression which has fallen from the noble duke," replied his lordship, "is altogether unworthy of him, and altogether unworthy as regards myself."—The Duke of NEWCASTLE repeated that he had certainly used the word "manœuvre," and did so again, though without imputing anything personally dishonourable to Lord Lyndhurst.—After a discussion in which a great many Peers took part, the adjournment of the debate was agreed to, and a committee to search for precedents was appointed.

Tuesday.—The adjourned debate on the Bangor and St. Asaph Bishopries Bill was postponed to Monday next.—The Earl of RADNOR presented a petition from Lyneham, Wilts, praying for a repeal of the Corn Laws, and originated a discussion, in which Lord METHUEN, the Duke of RICHMOND, the Duke of CLEVELAND, the Earl of STRAFBROKE, the Duke of BEAUFORT, Lord ASHBURTON, and Lord BEAUMONT took part. The point in argument was whether or not the rate of wages rose and fell with the price of food.—The Earl of DALHOUSIE moved the third reading of the Sugar Duties Bill.—Lord MONTEAGLE made various objections to the measure, but would offer no impediment to its progress.—Lord BROUGHAM spoke at some length, and gave his hearty concurrence to the Bill.—The Earl ST. VINCENT and Lord ASHBURTON, said a few words in favour of the West Indies.—The Earl of RADNOR and the Marquess of LANSDOWNE supported the Bill, as one which went in the direction of free trade.—The Bill was then read a third time and passed.

Thursday.—The Royal assent was given by commission, to the Sugar Duties Bill, Vinegar Duties Bill, Slave Trade Treaties Bill, Gold and Silver Wares Bill, Forestalling Acts Abolition Bill, Night Poaching Prevention Bill, Assaults (Ireland) Bill, Limitation of Actions (Ireland) Bill, Leeds and Bradford Railway Bill, Manchester and Bolton Railway Bill, York and Scarborough Junction Railway Bill, Eastern Counties Extension Railway Bill, London and South Western Railway Bill, Edinburgh and Tweed Railway Bill, London and Brighton Railway Extension Bill, South Devon Railway Bill, and several estate and naturalisation bills.—Lord WHARNCLIFFE having brought up the report of the committee appointed to search for precedents on the Bangor and St. Asaph's Bishoprics Continuance Bill, which reported that they could discover no precedents, moved the following question as an instruction to the committee:—"Whether the Bill for the prevention of the union of the sees of Bangor and St. Asaph belongs to that class of Bills for which it has been the usage to get the consent of the Crown before Parliament can pass it?" The instruction, after some discussion, was agreed to.—The Earl of RADNOR brought forward the question of the opening of letters at the Post-office, and moved for a secret committee to inquire into the practice of detaining and opening letters under the provisions of the 1st Victoria, c. 36; and more particularly into the circumstances under which the letters of Mr. Mazzini, a literary foreigner, residing in England, had been opened. The noble Earl said he had sometimes heard of the "conscience of the State," and he thought the expression great nonsense when applied to particular sects and opinions. The conscience of the State, as he understood it, was that the Government should take care that they did nothing to set an example of immorality. But by this practice Government were setting an example of falsehood, treachery, and forgery. He had, the other day, received a letter inclosing him one from another person, which he answered, and was much surprised to receive a letter the following day from another person, on which was a forgery of his (Lord Radnor's) seal. Was not that very thing done by some of the Government officers? He should be glad to hear that it was not, but if it was, that was forgery. What was to be expected from the country if this example of falsehood, forgery, and treachery were to be set by the Government? What was the conduct of the French Government in this respect? What said M. Guizot? "I do assure you," said he, "that letters are sacred in this country." Could the Government of this country say that? He felt ashamed that they could not.—The Duke of WELLINGTON admitted that the question had excited such a sensation throughout the country that an inquiry into the law and practice of these warrants was absolutely necessary. His Grace moved an amendment similar to that moved in the House of Commons by Sir J. Graham, for a secret committee, this committee to consist of seven Peers, three who usually sit on the Ministerial benches, and four selected from the seats opposite. The Noble Duke, who spoke very warmly, said, "Suppose that foreigners here are exciting and bribing others to rebellion in foreign countries at peace with us—suppose them to be fitting out an expedition from ports in her Majesty's dominions—from Corfu or Malta, for instance, for the invasion of Italy, is not that a breach of the hospitalities of this country? I say that it is an act inconsistent with the interests of this country—an act which it is the duty of this Government to detect—which it is the duty of the Secretary of State to take cognisance of, if he have information that such acts are going on. We have seen some remarkable events in recent times. It is but a few years ago since preparations were made in this country for the invasion of a neighbouring country. Was that an act consistent with the hospitality of the country? Would it not be the duty of the Government, on the first intimation of such an act, to endeavour to prevent it? I want to know whether we have not had warlike preparations carried on in our country? Have we not felt the inconvenience of them? Have we not felt the injury done us by them? Is it to be contended that because foreigners are here enjoying the hospitalities of the country that they are to be exempted from all the reciprocal laws of hospitality? Are they to be exempted from those laws of human conduct which must be maintained in order to secure the best interests of the country, and that the Government are to look on, and do and say nothing, until those foreigners strike the blow?"—The Marquess of NORMANBY particularly desired that the inquiry should extend to Ireland, as ridiculous reports had been circulated about the use he had made of the power with which he administered the affairs of Ireland, which an investigation would show had not the slightest foundation.—The secret committee, as proposed by the Duke of Wellington, and so amended as to extend to Ireland, was agreed to, and the Earls SOMERS, BURLINGTON, and ROSEBERY, the Bishop of LONDON, Lords COTTENHAM, COLCHESTER, and BROUGHAM were nominated.—In the course of the debate, Lord ABERDEEN took the opportunity to declare solemnly that "not a syllable of any correspondence opened under the authority of the Secretary of State had been shown to any foreign power whatever."—This declaration was received with loud demonstrations of satisfaction. The committee were appointed to meet on Thursday next.—The Privy Council Apellate Jurisdiction Bill was read a third time and passed, the clauses relating to divorces having been withdrawn by Lord BROUGHAM.

Friday.—The Earl of MINTO called attention to the affairs of Morocco. The noble lord said the subject was one of extreme importance, in the event of any contest arising in the empire of Morocco. He understood that the mediation of England was likely to be declined, a circumstance which he must say he deeply regretted, though at the same time he did not feel surprised, for we were not placed in a position to afford a weaker state those assurances of support which might have been confided in, had there been any preparation on the part of this country to increase our naval force, which he lamented to say was very inefficient; not that he anticipated war—God forbid that he should. The noble earl then proceeded to animadvert upon the low ebb of our present naval force, contending that it ought to be increased in various parts of the globe, in order to the protection of the British flag; he further contended that this was the more necessary, seeing that the French had increased their fleet very considerably within a recent period. He wished to know if Ministers were to adopt any step as regards the empire of Morocco for the better protection of British interests.—The Earl of HADDINGTON said the practice of making speeches and statements as the noble earl had done was very inconvenient; he had never been more taken by surprise in his life than he had been by the noble earl's speech, which speech he would not answer, seeing he had received no notice of it; to the question alone he would confine himself. He had to inform the noble earl that Ministers had sent an additional force to the Mediterranean, and if necessary for the protection of British interests, a still greater force would be sent. So, likewise, with regard to the Pacific and the coast of Africa. (The noble earl shook his head.) He begged to assure the noble earl, that he shook his head without any occasion. In conclusion, her Majesty's Government had sent such force to the coast of Morocco as they conceived necessary, but happily they were of opinion that it would not be required.—Some conversation arose on a point of order.—Lord LONDONDERRY having risen to address the House, asked if he should be in order if he spoke on the same subject.—The LORD CHANCELLOR said the speech of Earl Minto was irregular; it had been allowed, however, and he could not tell where the irregularity ought to stop.—Lord LONDONDERRY again rose, and was left speaking.

HOUSE OF COMMONS.

Friday.—On the motion for the third reading of the Dissenters' Chapels Bill, Mr. COLQUHOUN moved, and Sir R. INGLIS seconded, an amendment, that it be read a third time that day six months. After some observations from Lord ELIOT, in support of the Bill, Sir T. WILDE said he had been originally adverse to this Bill, but was now, upon reflection, satisfied of its justice and expediency. It was no more than the application of the general and useful principle of limitation to a class of cases to which it had not been applied before. The law having decided that the Unitarians and the Church of England *are not* entitled to this property, a mass of speculative litigation was now threatened, of which the object was to ascertain who *are* entitled to it—a litigation which, if not thus prevented, would hardly terminate until it should have swallowed up all the funds. Lady Hewley's case had left the whole law at sea. In this state of things, the Bill proposed merely that where there was no trust-deed declaring the mode of faith, the usage of the last 25 years should be conclusive evidence on that subject; the effect of which would be, that future founders would take good care to have trust-deeds. It had been said that he had originally undertaken to lead the opposition against this Bill, but it was wholly unfounded. His opinion had, indeed, been at first an adverse one; but he had never given any promise or pledge upon the subject.—Mr. SHAW explained; and a division took place—For the third reading, 201; Against it, 81; Majority for it, 120.—The House then went into committee on the details of the Bank Charter Bill, which passed through committee, none of the several amendments which were proposed having been adopted.—The Education Bill, the Linen &c. Manufactures (Ireland) Bill, and the Charitable Loan Societies (Ireland) Bill passed through committee.—On the motion of Sir C. BURRELL, a committee was nominated on the petition for aid towards repairing St. Margaret's Church, Westminster.

Monday.—Sir R. PEEL stated the measures which Government propose to carry forward during the present session, and those which are to be abandoned. The more important of those to be pressed (after the Bank Charter Bill, and one yet to be introduced, as a corollary to it, for the regulation of future, not existing joint-stock banks), are the Poor-law Amendment Bill, the Railways Regulation Bill, Savings Banks Bill, Presbyterian Marriages Bill, and a variety of others to which no material opposition is anticipated. With respect to the County Courts Bill, Government will not make an announcement, until the House of Lords come to a decision on the principle which is to be adopted on the subject of Imprisonment for Debt. Amongst those Bills which are to be dropped are the Irish Registration and Franchise Bill, with its companion, the Municipal Corporations Bill, and the Ecclesiastical Courts Bill, the announcement of the postponement of which was marked by significant cheering. The Committee appointed to inquire into the subject of the jurisdiction of the House with respect to contested elections, have reported, suggesting certain alterations to be made in the law: and a Bill will be introduced to give effect to their recommendation.—On the order of the day for the second reading of the Irish Registration Bill, a long and desultory discussion ensued, in which Mr. T. DUNCOMBE, Mr. V. SMITH, Mr. M. J. O'CONNELL, and Mr. SHEIL, took part.—Sir. R. PEEL said he had no desire to press it; and as the postponement of the debate was in deference to the general feeling, the order of the day for the second reading of the Bill, and for the Committee on the Municipal Corporations Bill, were discharged, both measures being thus abandoned for the present session. —The House then proceeded to the Committee on the Unlawful Oaths (Ireland) Bill, which is proposed to be renewed for another year.—Mr. M. O'FERRALL raised a discussion on a clause of the Bill which makes the possession of copies of illegal documents penal, unless the individual can prove that he was ignorant of their nature and purport. As the power had been abused for improper purposes, he moved, as an amendment, the omission of the words conferring it.—Several Members addressed the Committee; and Sir J. GRAHAM gave the history of the measure. It originated with the late Government, its object being the suppression of unlawful societies, which he believed still existed in Ireland. The power was an extreme one, and could only be justified by extreme circumstances: but it was necessary to render the Bill effective; and as the measure was only to be renewed for one year (having been originally passed for five), there was less occasion for that constitutional jealousy which he admitted would otherwise be rightly directed against it.—Mr. M. O'FERRALL saw no necessity for the renewal of the Bill at all; and opposed its farther consideration by moving that the Chairman report progress.—Lord ELIOT and Sir J. GRAHAM protested against this. It had been admitted that there were unlawful societies in Ireland, and the Government were responsible for its tranquillity, which the Opposition were free from.—Colonel RAWDON denied this; and on a division the numbers were 58 to 40 against the amendment. The Bill then went through committee, and was ordered to be reported.—The Prisons (Scotland) Bill, after some observations from Mr. WALLACE, Sir J. GRAHAM, and Mr. P. M. STEWART, went through committee.

Tuesday.—Mr. WALLACE brought on a motion impugning the conduct of two of the Scotch Judges (the Lord Justice Clerk and Lord Wood) on a trial at the recent Glasgow assizes. He argued, on the authority of ten of the jurymen, that the case had been improperly stopped, and a prisoner allowed to escape from the due operation of justice.—The LORD ADVOCATE explained the circumstances attending the case, from which it appeared that it had been given up by the public prosecutor, on account of the failure of evidence, and therefore no other course remained but the acquittal of the prisoner. The complaint he attributed to certain grumbling discontented jurymen, who fancied that an improper interference had taken place.—Mr. WALLACE pressed his motion to a division, when he was supported by 36 against 149.—Mr. T. DUNCOMBE then brought forward his motion on the Post-office. He remarked that at four o'clock, when there was considerable difficulty in "making a House," not a single member of the Government was present, which did not corroborate their professed anxiety for bringing on the motion. The illegal opening of letters took place in a department known amongst those employed in the General Post-office as the "Secret or Inner-office." Here those "deeds of darkness" were done; not only were the letters of private individuals opened, but those of the foreign Ministers regularly underwent examination; and when the subject was recently adverted to in the Chamber of Deputies, M. Guizot took occasion to say that the secrecy of letters was respected in France, thus making out the practice to be peculiarly English, instead of being *un*-English. Even in Austria, where letters were opened, a Government seal intimated the fact. It had been said that the whole matter related to only one letter of Mr. Mazzini's; but the practice had been carried on during the last two years to a most unscrupulous extent; and during the disturbances in the manufacturing districts, individuals were sent from the General Post Office into the provinces, with authority to open letters—whose he did not know, perhaps everybody's. The practice was to send for a particular bag—say the letters for the Albany—and nobody out of the Secret Office knew what was done with them. Foreigners were not aware of the extent to which the practice was carried; and it was only beginning to be suspected that many unhappy individuals, now pining in foreign prisons, may owe their incarceration to information furnished through the medium of the British Post Office. They had long suspected the existence of the practice, and letters were sent as "traps" for the Government; in one of them there was an allusion to the approaching visit of the Emperor Nicholas, and the very next morning the newspapers contradicted the rumour that he was coming, though he arrived five days afterwards. You compel every man, under a penalty, to send his letters through the Post-office, and then you take advantage of that compulsion to open them. If you do open letters, at all events you ought not to commit forgeries of seals and papers, in order to conceal the act. Pledging himself to substantiate his allegations by proof, he moved for a select committee to inquire into the duties and employments of the individuals employed in the Secret or Inner department of the General Post Office.—Sir J. GRAHAM said he was ready to admit the primary importance of the subject, which was a question between the people of this country and the executive Government. The charge of opening letters by wholesale for two years was a very grave one; and seeing how the public mind had been inflamed on the subject, and how he had himself been run down by the public press, the time was now come when he must speak "the truth, the whole truth, and nothing but the truth." Lord J. Russell acknowledging the existence of the power had admitted that he (Sir J. Graham) might not have acted otherwise than his predecessors in the Home-office; yet Mr. Macaulay and other "sworn councillors" of the Crown, familiar as they were with the practice, the responsibility, and the restraints of office, had not scrupled to direct the force of impassioned declamation not against the law, but against himself, as if he had been guilty of introducing a new and obnoxious practice. He was thus absolved from all reserve, and would state not only all that had been done by himself but by his predecessors. The power was given not only to the Home-office, but to the Lord Lieutenant of Ireland; and in the secret, not select committee of inquiry which he would propose as an amendment, he hoped that a full inquiry would take place, and out of which he would come discharged of having acted otherwise than any of his predecessors in the Home-office. But as the whole efficacy of the power conferred by the law depended on secrecy, it was essential that the inquiry should be conducted before a committee of secrecy, to be composed of gentlemen unconnected with office, and from which both the accuser and the accused should be excluded. The number of individuals composing the committee he would limit to nine, five of whom should be selected from those usually opposed to him in politics. He then read their names as follows:—Lord Sandon, Mr. H. Drummond, Mr. T. Baring, Sir W. Heathcote, Sir C. Lemon, Mr. Warburton, Mr. Strutt, the O'Connor Don, and Mr. Ord.—Mr. SHEIL suggested that a lawyer would be a useful addition to the committee. If the Post-office functionaries were to be examined a forensic inquisitor would be useful in a thorough investigation.—Sir G. GREY, after defending his previous vote on this subject, to which he was led by the obstinate silence of the Government, admitted that a secret committee was the most suitable medium of inquiry, which should be full and searching, and from which the members of the late Government would not shrink. He suggested, however, the expediency of deferring the naming of the committee till next day.—Mr. ROEBUCK, though doubting if the public would be satisfied with a secret committee, would not object to an inquiry with closed doors, but wished to insure the full publication of the evidence when it was completed. It would be an inquiry, not merely into practice, but into law; and it was desirable that the committee should be guided by some individual in whom the House could have confidence. He sympathised with Sir J. Graham, who had been rendered an object of bitter calumny for simply doing what his predecessors had done before him; but the power which the law conferred was obnoxious to our habits and feelings. Giving M. Guizot implicit credit for personal veracity, he doubted the correctness of his representation of French practice, and read a copy of an official letter, written during the hundred days, showing that at least formerly violation of the privacy of correspondence was common enough in France.—Mr. LABOUCHERE, who, in 1837, had been the medium of introducing the act consolidating the statutes relative to the Post-office, explained that he did so simply as an act of consolidation, not of improvement or alteration, and he was therefore free from the charge of having renewed or perpetuated this power of opening letters. He expressed his satisfaction that the matter was now to undergo a full and impartial investigation, and was satisfied with the committee. —Sir R. PEEL cordially and personally rejoiced at the opportunity which would now be afforded to the whole Government of sharing that responsibility for an invidious function, which ought not to rest individually on the Secretary of State. The Government had purposely omitted lawyers; they had not wished to originate a squabbling about legal constructions, which would have been regarded by the public as a diversion and distraction from the real object of the inquiry. The point upon which the people of England wished to be informed was not the point of *law*. An objection was made as to the proposal of secrecy, but without such a guarantee you would not obtain from individuals that full disclosure which was so necessary to the present purpose. He pressed that the nomination might be immediate, the rule which requires notice of the names in the case of a select committee not extending to the case of a secret committee.—Lord J. RUSSELL said, that on the former motion he had come to the House apprehending that he should be able to support the Ministers, from whom he naturally expected some explanation of their general principles. He had, in fact, on that occasion defended the existence of the authority; but, finding it stated that the power had been used for purposes connected, not with our own, but with foreign Governments, he had felt that, on the refusal of Sir J. Graham to give any explanation, however general, it was his duty to vote for the motion then made. He approved the suggestion of secrecy, and was willing to adopt any names which the Government might propose. He was quite willing to be personally examined before the proposed committee.—Mr. WAKLEY thought that secrecy was an extraordinary mode of satisfying public curiosity. He praised the zeal of the press, which had excited the public feeling. The public at large were as competent to form an opinion as the nine members who were to constitute the committee. The defence of Sir J. Graham seemed to be that, if his own conduct had been dark and queer, still it had not been worse than that of his predecessors. The committee might probably might finish their report with a recommendation that the power should in future be exercised with forbearance and then the practice would go on for 20, or 30, or 40 years more, till there should come another such explosion as the present.—Mr. M'GEACHY was glad that, as Ministers had twice in the session asked their friends to reverse a decision, they were now prepared to reverse a decision of their own, by granting the information which they had before refused.—Mr. WALLACE wished the committee to be an open one. There was no use in granting a committee at all, unless its evidence were to be published.—Mr. MACAULAY, with reference to what had fallen from Sir J. Graham, declared that he had never participated in the opening of any letter under this power, nor become acquainted with the contents of any letter so opened, and denied that he had come to the House on the late occasion for the purpose of attacking Sir J. Graham. The right hon. Baronet had then refused to make that statement of general principles which he now referred it to a committee to make. If that statement would be prejudicial to the public, it ought not to be authorised now; if it would not be prejudicial to the public, it ought not to have been refused then. He did not believe that anything which could proceed from that committee would change his opinion of the danger and mischief of this power.—Mr. WILLIAMS objected to the nine Members named, as being all of them adherents of one or other of the two great political parties. He thought Mr. Duncombe and Mr. Hume ought to be upon the committee.—Mr. CURTEIS condemned the practice in question, and thanked Mr. Duncombe for having exposed it.—Mr. DUNCOMBE did not think the public would be satisfied with a secret committee, nor with the names proposed by Government. They offered an inquiry as to the *mode* in which letters had been opened; the words "circumstances and extent" ought to be added. He wished particularly to know whether the Post-office had opened the letters directed to the Albany, and among them any letters of his? If the committee should not do its duty, he should not feel himself precluded from renewing his motion.—After some discussion about the terms in which the inquiry should be directed, the amendment moved by Sir J. Graham in the following form was agreed to: "That a committee of secrecy be appointed to inquire into the state of the law with respect to the detaining of letters in the General Post-office, and to the mode in which that power has been exercised, and that the committee should have power to send for persons, papers, and records, and to report the result of their inquiry to the House."—It having been discovered that Mr. H. Drummond had practised at the bar some twenty years ago, the name of Mr. W. PATTEN was substituted for his. With this exception the committee as proposed by Sir J. Graham was nominated, after an unsuccessful attempt, on the motion of Mr. JAMES, to add Mr. Duncombe's name, which was rejected by 128 against 52. Five of this committee are to constitute a quorum.—The House then proceeded to a motion of Mr. MACKINNON, for a committee upon prison system, which was seconded by Mr. WILLIAMS.—Sir J. GRAHAM hoped that the motion would not be pressed, it being obvious that, independently of other objections, the session was too far advanced to allow any useful proceeding by a committee in the present year.—Mr. WAKLEY concurred in this opinion, but hoped for a committee next session to consider various points which he regarded as of great importance.—Mr. MACKINNON then withdrew his motion.

Wednesday.—The House met at 12 o'clock. On the order of the day for going into committee upon the Joint Stock Companies Bill, Mr. HAWES objected to the measure. Ministers, he said, seemed disposed to interfere in everything, and settle nothing. Their interference here had been without sufficient notice, was vexatiously minute and meddling, and gave the Board of Trade an excessive power over all joint-stock companies. He moved that the Bill should be committed on that day six months.—Mr. HAYTER seconded the motion.—Mr. GLADSTONE observed that Mr. Hawes had been a member of that committee on whose resolutions the Bill was founded. It was indeed the Bill, not of Ministers, but of that committee, and their resolutions had now been four months in print. As to the powers of the Board of Trade, this Bill went not to enlarge, but to restrict the discretionary powers of that board, whose members, so far from seeking to increase, were sincerely anxious to get rid of their discretionary authority in the management of commercial matters. The main objects of the Bill were simply to establish publicity and regularity in the proceedings of joint stock companies, and to prevent jobbing in scrip.—Sir W. CLAY declared his general approbation of the measure.—Mr. GODSON also approved it, and referred to the mischief done by such companies as the Independent and West Middlesex Insurance Company.—Lord SEYMOUR recommended the exclusion of railway companies from the Bill.—Mr. PARKER recollected the time when Mr. Gladstone would have been very eloquent against any Bill of 91 clauses introduced in July. One great advantage promised from the change of Ministers was that the country was to have no more ill-drawn Bills. He thought this measure would confer very great patronage on a certain office in Whitehall.—Several members spoke in favour of the exemption of railway companies, in whole or in part.—Mr. GLADSTONE proposed that the committee should go through the Bill, and that it should then be open to any member to propose the total or partial exception of railways.—After some further conversation, Mr. HAWES withdrew his amendment, and the House went into committee.—The first clause was agreed to, and then progress was reported. — Mr. MACKINNON withdrew his Smoke Prevention Bill for the present session, after Sir R. PEEL had expressed a hope that gentlemen connected with the manufacturing districts would turn their attention to the subject during the recess.—The other orders of the day, which were of no interest, having been disposed of, Mr. Sergeant MURPHY moved for a committee of the whole house upon the subject of ministers' money in certain corporate towns of Ireland, payable under the 17 and 18 Car. II., chap. 7. The burden which he sought to abolish was under 15,000*l.* a year; and he could not but think that it would have been removed by Government at the time of the settlement of the tithe question, except for some mere oversight or inadvertence. He proposed this in no sectarian spirit: the Protestant clergy themselves would gladly see some other mode of remuneration introduced in the room of this obnoxious payment, which was of a very unequal character. No house, whatever its yearly rent, could be rated upon a larger rate than 6*0l.* per annum; so that a poor tenant had to pay upon the full value of his occupation, while a rich man, having a house worth 200*l.* a year, paid upon less than a third of that rent. All he sought was, that Government should substitute some other mode of remuneration.—Lord ELIOT said that the Irish Government had anxiously considered this subject, but had not been able to devise any redress. Indeed, the learned Sergeant himself had not ventured to suggest any specific remedy. It should be remembered that the owners of the houses thus rateable had bought them the cheaper because of their liability to this burden. —Mr. BELLEW suggested the extinction of 50 small livings and the application of their income in substitution for this tax. That would be no innovation; there was a precedent in the Church Temporalities Act.—Lord STANLEY argued that such a proposal was not within the principles of the Temporalities Act,

He should, however, be very glad if some fair substitution could be devised.—Mr. J. O'BRIEN supported the motion; but during his speech, there being very few Members on the Ministerial benches, an attempt was made to get rid of the matter by "counting out" the House. This failed, from the presence of upwards of 40 Members; and on the conclusion of Mr. O'Brien's address the galleries were cleared, but Ministers not being attended by a sufficient number of their usual supporters, were obliged to submit to the motion being carried, without a division, which provoked loud laughter and ironical cheering from the Opposition benches.

Thursday.—To a question put by Mr. P. M. STEWART, Sir R. PEEL stated that he had no intention of touching the currency of Scotland or Ireland by any new legislation in the present session, or without full communication with the parties interested. The right hon. baronet, in answer to Mr. Sergeant MURPHY, announced that he should endeavour to reverse the vote of the House, obtained on Wednesday, on the question of Ministers' Money.—On the order of the day for the third reading of the Bank Charter Bill, Mr. WODEHOUSE spoke strongly against the principle of the measure, and finished his speech by proposing the addition of a clause, allowing silver as a legal tender in any payment not exceeding the sum of twenty-five pounds.—Sir R. PEEL replied that our silver money was used, not as a coin, but as tokens, and not bearing an exact relation to the standard of value—gold. Any enactment to make silver, as coined, a legal payment, would amount in fact to a depreciation of the currency.—After some further conversation, Mr. WODEHOUSE withdrew his clause.—Mr. TURNER then tendered an amendment, to compel the Bank to receive, as of full weight, such sovereigns and half-sovereigns as balanced in the scale; the object being to prevent the loss of the light coinage falling on the humbler classes.—Sir R. PEEL objected that the present Bill had nothing to do with the coinage, and that, therefore, the amendment was not relevant.—The subject of the light coinage, and the hardship of the loss falling on the public, was dwelt on by Mr. HUME, Mr. C. WOOD, and others; and then the amendment was withdrawn. Some conversation followed respecting the "legal tender" clause, on the conclusion of which the Bill was passed, and sent up to the Lords.—The next business was the committee on the Poor-law Amendment Bill. On the question being put, Mr. FRENCH asked certain questions respecting certain facts connected with the working of the Poor-law in Ireland, which Sir J. Graham declined to answer, as being too comprehensive, as well as affecting individuals. — Mr. B. COCHRANE moved as an amendment, that the new Poor-law, though improved by the proposed amendments, is still opposed to the ancient constitution of this realm, and inadequate to the necessities of the people, and that the House go into committee that day six months. He contended that the principle of the new Poor-law was so bad, and so pernicious to the feelings and character of the people, that no partial amendments could render it a good law. Contrary to the principle of the Act of Elizabeth, which tested poverty by labour, this Act tested poverty by suffering. To remedy the evils of the old system workhouses had been erected, in which the regulations were as severe as those to which criminals are subjected, and in many of which the amount of food is less than that which is allowed to convicts, in some cases barely sufficient to support existence. And what had been the saving by the change? Nothing, in comparison to the resources of the country, and unworthy of consideration when wrung from the increased suffering of the poorer classes. To the manufacturing system Mr. Cochrane attributed the general poverty of the working people; and he maintained that the landowners had a right to complain that, while a system of manufactures was introduced which stimulated population, and enabled the manufacturers to cheapen human labour by the unlimited use of machinery, they threw upon the land the burden of this fearful pauperism. Stocks in trade were not assessed, and manufacturing capital did not contribute to the relief of the poor. He therefore called on the House to take up the cause of the poor, identify itself with their feelings, and, for the sake of humanity itself, check our downward national progress, by ameliorating their condition, and rejecting the Bill.—The SPEAKER having decided that Mr. Cochrane's amendment was not strictly in form, the order of the day was read.—On the question that the Speaker leave the chair, Mr. BORTHWICK rose to submit the following resolutions:—"That the Act 4th & 5th Wm. IV., c. 76, commonly called the New Poor Law, is unconstitutional in principle and oppressive in practice. That it is, therefore, expedient that the said Act should be taken into consideration, with a view, not to its partial amendment but its entire reconstruction." He contended that the existing Act was unsound in principle and oppressive in its operations; it was impossible that it could be satisfactorily amended by any patching up of its details, and it would be necessary to reconstruct it on a broader, more general, and more catholic principle. The laws by which they regulated relief to the poor ought not, he said, to be based on principles of political economy, cold, abstract, calculating, and theoretic, but they ought to be based on generous principles of humanity and religion, applied in their broadest and most catholic form, to the wants and requirements of the people.—The resolutions were seconded by Mr. FERRAND.—Sir J. GRAHAM, taking the statute of Elizabeth as his starting point, said that as early as the reign of Charles II. its imperfections were felt, acknowledged, and attempted to be remedied; and cited the records of the House of Commons during the latter portion of last century, to show how early the Legislature had been compelled to struggle with the question ultimately terminated by the great change in the Poor-law made in 1834. His official experience came in aid of his private opinion that this change had been a beneficial one for the working classes themselves. There was no prohibition of out-door relief; out of a million and a half relieved last year, no less than seven-eighths received it at their own homes. He defended the law by detail, and urged that the only way of meeting the evils arising out of a dense population was to increase the means of productive industry. Practically, the wisest and humanest course would be, not the abrogation, by summary resolution, of a law by which the interests of the poor were recognised, but to introduce such amendments and improvements as would better adapt it for its beneficial purposes. —Mr. S. WORTLEY, though dissenting from the resolutions as vague, and denying that he wished the repeal of the Poor-law, criticised it, mainly on the ground of the undue extent of some of the unions. — Lord J. RUSSELL showed that the complaints raised against the law, such as on separation of man and wife, and so forth, had no origin in the statute, distinctions like these having been recognised under the old system. The legislation of Elizabeth was not so favourable to the poor as lively imaginations pictured: ear-branding, flogging, and other punishments, being devised against vagabondism, while the evils engendered in the course of time, by the growth of population, became so intolerable as to render imperative that great, though invidious change undertaken by Lord Grey's Government. Amend the law as experience and the severe trials to which it has been subjected may suggest; but break down its principle, and you will return to the state of things which prevailed before 1830, when the vagabond and idle were patronised, the industrious discouraged, and property endangered. He was glad therefore that Government had determined to maintain it, and he hoped that they would meet less obstruction in carrying this Bill through committee than he did with the original enactment, seeing so many then in opposition who were now in or connected with office.—Sir W. JAMES, Captain PECHELL, Mr. S. CRAWFORD, Lord SANDON, and Mr. WAKLEY joined in the discussion, the latter designating the union workhouses as places of torture, but expressed his fears that there was no prospect of a repeal of the law, seeing that the two leading parties in the House concurred in mutual laudation and maintenance of the system. Justice, not humanity was the demand of the working classes; give them freedom in the exercise of their industry, and they would not ask for charity. But seeing that the law was to be maintained, he regretted that the resolutions had been proposed, as they only excited additional discontent with the working of the law; and he was bound to admit that the Poor-law Commissioners now administered the law in a manner which gave general satisfaction.—Col. WOOD (Brecon), and Mr. BROTHERTON followed, and then Mr. FERRAND moved the adjournment of the debate. —Sir R. PEEL remarked that Government were under no obligation to proceed with the Bill. It was not the continuation of a temporary enactment, but had been brought in by the Government under a sense of duty, with the view of mitigating the rigour of the existing law. If the object was to defeat the Bill its opponents would gain nothing, for Government could afford to drop it altogether. He hoped that at the present period of the session no unnecessary delay would be interposed.—Lord J. MANNERS expressed his astonishment at this intimation, which, if he had not heard, he could not have believed. They had discussed every other subject, many of them wholly uninteresting to the peasantry of England, but they grudged two nights' debate on a measure affecting the interests of millions of their fellow-countrymen.—Mr. ESCOTT did not think that the Bill had been sufficiently discussed.—Lord STANLEY agreed; the Bill had not been discussed at all. When the Government brought in a measure to mitigate the rigour of the law, they were obstructed by a discussion on the principle of the existing Poor-law system.—Lord J. MANNERS interrupted Lord STANLEY, to say that an association for providing relief for the destitute had been abandoned, waiting on this discussion, and expecting the ameliorations of the Bill.—Lord STANLEY replied, that if the Bill was to be defeated by a superfluity of talking, what would its opponents gain? If they repealed the existing law, what would they substitute? The measure, at this late period, might be defeated by members who wished to hear themselves talk on abstract principles. He ridiculed the "matured charity and humanity professed for the working people," by Lord J. Manners and his friends, and said that hon. Gentlemen were so fond of hearing themselves talk, that they thought nothing of postponing the practical business of legislation.—Mr. BORTHWICK and Mr. COCHRANE strongly reprobated the tone and bearing of Lord Stanley as unworthy of his position and of himself. This extracted an apology from his Lordship, and a division was taken on the question of adjournment, when it was rejected by 219 to 18.—Mr. FERRAND again moved the adjournment, and complained that Government had not fulfilled its pledge in permitting a full debate on the subject, and threatened continued opposition unless it were.—Sir J. GRAHAM and Mr. DUNCOMBE commented on this obstruction, which was not justified by facts.—After some discussion, a division took place, when Mr. Borthwick's resolutions were rejected. The House subsequently divided on the main question, when there were—For going into committee, 199: against it, 19; Majority, 180; but no further progress was made.—On the motion for the second reading of the Gaming Discontinuance Bill, Mr. CHRISTIE moved an adjournment, which was defeated by 61 to 10. The Bill was then read a second time.

Friday.—The Speaker took the Chair at 4 o'clock, after an interval of half-an-hour, during which no business was done, and only two members on the Opposition benches.—Lord SANDON moved that the Secret Committee of Post-office Inquiry might have leave to sit, notwithstanding the adjournment of the House, which was agreed to. — Mr. FERRAND said he had been requested to ask the Secretary for the Home Department if he had received any official information relating to an accident arising from the explosion of a steam boiler in a manufactory at Bolton, by which accident several persons lost their lives.—Sir J. GRAHAM said he had not received any official report on the subject; in fact, he was not aware of it until mentioned by the hon. Member.—In answer to Mr. D. BARCLAY, Sir J. GRAHAM said it was the intention of the Government to proceed with the Medical Reform Bill during the present session.—In answer to Mr. BELLEW, Sir J. GRAHAM said that he should lay on the table a Bill relating to the law of settlement during the present session; but he should not ask to pass it this session.—On the motion of Mr. GLADSTONE, the committee on the Joint Stock Companies Regulation and Registration Bill was postponed to Wednesday next. — On the motion of Mr. THORNELY, a new writ was ordered for the election of a member for Birmingham, in the room of the late Joshua Scholefield, Esq., deceased.—Sir J. GRAHAM moved that the House resolve itself into Committee on the Poor-law Amendment Bill. On the motion being put from the chair, several petitions were presented in favour and against the measure, after which the House went into Committee on the Bill, Mr. Greene in the chair.—Col. SIBTHORP moved, on the 1st clause being read, that the Poor-law Commission be abolished. A long desultory conversation took place, in which several members took part, and Colonel SIBTHORP withdrew his motion. The first clause was then agreed to.—On the second clause being moved, Colonel SIBTHORP said, he had hitherto placed confidence in the present Government, but he should not do so again.—A long desultory conversation took place on the clause, which was proceeding when our report closed.

CITY.

Money Market, Friday. — Consols for the account closed at 98⅞. Red. Three per Cents. 99⅝, Three-and-half per Cent. Red. 102½. Exchequer Bills 74*s.* to 76*s.*, prem. Bank Stock 198 to 199.

GAZETTE OF THE WEEK.—BANKRUPTS.—H. W. COLLINSON, Stamford street, hat-maker—T. SCOTT, Colchester, baker—W. HARDING, Camberwell, grocer—F. ROBERTS, Handley, Cheshire, butcher—F. STOKES, London-wall, French warehouseman — P. TANSLEY, St. John-street-road, West Smithfield, straw plait dealer—M. CASANAS, Fenchurch-street, wine-merchant—J RAMSAY, Chapel-street, Somers' Town, cheesemonger—T. J. SWAINE, Newland-street, Eaton square, Pimlico, innkeeper—T. HINDMARSH, Hartlepool, Durham, grocer—F. PLANK, Plymouth, perfumer—J. VERNON, Monks Coppenhall, Cheshire, victualler—R. LONER, Thornhill, innkeeper.

Metropolis and its Vicinity.

Funeral of Mr. Campbell.—The funeral of this eminent poet took place on Wednesday in Poets' Corner, Westminster Abbey. Those who were invited to attend the funeral assembled shortly after 11 o'clock in the Jerusalem Chamber, which was nearly filled with the friends and admirers of the poet, consisting of noblemen, members of Parliament, and literary men, who were admitted through the entrance from Dean's-yard to the cloisters, on showing their letters of invitation. The public were admitted into the Abbey at the entrance at Poets'-corner, and took their stations behind the spiked railings used for keeping the body of the church clear. It was nearly 12 o'clock when the procession left the room in which the coffin had been placed, and the gentlemen in the Jerusalem Chamber fell into order, and followed. The procession passed through a door opening from the Chamber into the south aisle, and along it to Poets'-corner. The following was the order of the procession:—The Rev. Mr. Milman, the officiating minister. The coffin, covered with a large black pall, supported by the Duke of Argyll, Lord Brougham, Lord Aberdeen, Lord Campbell, Lord Strangford, Lord Morpeth, Lord Dudley Stuart, Lord Leigh, and Sir Robert Peel, all of whom wore scarfs and hatbands. The Chief Mourners, viz., Mr. Alex. Campbell and Mr. Wiss (nephews of the deceased) in crape scarfs and hatbands. The Executors, Dr. Beattie and Mr. W. Moxon. Mr. J. Richardson, Mr. W. Ayrton, the Rev. C. J. Hassells, and Mr. E. Moxon, the poet's publisher, wearing silk scarfs and hatbands; and after these the great body of the mourners, walking two-and-two, amongst whom were—Sir J. C. Hobhouse, Sir J. Hanmer, Major-Gen. Sir J. Macdonald, Sir P. F. Shelly, Bart.; Right Hon. T. B. Macaulay, Mr. Milnes, Mr. Disraeli, Right Hon. R. Sheil, Mr. Emerson Tennent, Mr. Christopher, Mr. Lockhart, Rev. W. Harness, Rev. A. Dyce, Mr. W. S. Ayrton, Mr. Horace Smith, Mr. Dilke, Dr. James Johnson, Sir P. Laurie, Mr. Ainsworth, Rev. Dr. Croly, Mr. Pettigrew, Dr. C. Holland, Sir J. Ross, Mr. Buckingham, &c. A deputation from the Literary Association of Poland, of which the deceased poet was the founder, was also present, one of whom carried a small portion of earth from the grave of Kosciusko, near Cracow, which was cast into the grave of Mr. Campbell, to mingle with the dust with which he is covered. The coffin, pall-bearers, and mourners having arrived at the grave, which is nearly in the centre of Poets'-corner, and within a few yards of the tomb of Addison, the Rev. Mr. Milman read the service in a very impressive manner. At the conclusion of the epistle, the coffin having been lowered into the grave, the dead march in *Saul* was played by Mr. Turle, the organist of the Abbey, after which the remaining portion of the service was read, and the last mournful office having been concluded, the mourners retired, some through the cloisters, and others through the door leading to the Jerusalem Chamber, and thence to Dean's-yard. The whole was conducted with the solemnity and decorum the occasion required. The coffin bore the following inscription:—"Thomas Campbell, LL.D. Author of 'The Pleasures of Hope.' Died June 15th, 1844. Aged 67."

Royal Commission of Fine Arts.—This Exhibition, which was honoured by the presence of her Majesty on Friday, was opened to the public on Monday on the payment of 1*s.* each. So great was the interest excited by the exhibition that no less than 1500 persons paid for admission in the course of the day. The general effect, on entering the hall, is very imposing. The walls are hung with frescoes, occasionally interspersed with cartoons, while in the foreground, and running the entire length of the Hall, are two rows of sculptured figures; the total number of works of art in the exhibition amounting to 183. The sculpture forms the chief feature in the exhibition, numbering upwards of 100 subjects, many of them groups consisting of several figures. Among the names of the artists contributing may be mentioned Messrs. James Wyat, Park, Hemming, Gibson, Bell, Westmacott, Weekes, Behnes, Carew, Lough, and Baily. The works, taken collectively, form a magnificent display, and certainly on no former occasion has so large a number of subjects been brought together under circumstances so favourable to their exhibition. The fine old Hall being in itself so well adapted for the purpose, renders the occasion altogether an era in this department of art. The large majority of works are original subjects, many of them illustrating points of English history. There are also many portrait statues, and a few models of works already known, which, by the arrangements of the exhibition, were privileged to be admitted if executed within the last five years. Of the fresco department of the exhibition it is satisfactory to know, that considered as following up the experiment commenced with the cartoons, the works sent in are pronounced by the commissioners highly satisfactory. The specimens do not exceed 60 subjects; among the contributors are no less than 14 artists who received prizes varying from 300*l.* to 100*l.* on the occasion of the recent cartoon exhibition. In addition to these, other distinguished names are found in the catalogue, among which may be mentioned that of Mr. Maclise, who contributes a large subject finished in his most perfect style, and displaying a brilliancy of colouring scarcely exceeded by some of his oil pictures. Mr. Foggo and Mr. Buss are also among the contributors, and Mr. Herbert, the Academician, sends an unfinished subject, which was unfortunately too late for admission into the Hall, and is thus excluded from the catalogue, and suspended in the vestibule.

University College.—The distribution of prizes to the students of the Faculty of Arts and Laws of this college, on the termination of the academical session, took place on Saturday. Lord Robert Grosvenor, M.P., presided, and was supported by the Earl of Auckland, president of the senate; Mr. Taylor, the treasurer; Mr. Wood, chairman of council; Professor Forster, of Berlin, Sir I. L. Goldsmid, Bart., Mr. Waymouth, Mr. Christie, M.P., Mr. Thornely, M.P., Mr. Crabb Robinson, and other members of the council, together with the professors, and a numerous assemblage of visitors. The body of the theatre was as usual filled with the friends of the students. After the distribution of the prizes, Lord Robert Grosvenor addressed the meeting at great length, dwelling on the favourable prospects of the college, and on the success which had marked the career of many of its former students. Lord Auckland then proposed a vote of thanks to the noble chairman, which was carried by acclamation.

King's College.—The general distribution of prizes took place on Friday in the theatre of King's College, by his Grace the Archbishop of Canterbury, in the pre-

sence of a large number of the friends and patrons of the institution, amongst whom were the Bishop of Lichfield, Lord Radstock, Mr. Justice Coleridge, Sir R. H. Inglis, Bart., Archdeacon Sinclair, Mr. H. Pownall, Rev. Dr. D'Oyly, Rev. Dr. Jarvis, President Baron von Gesbach, Colonel Coryton, the Dean of Westminster, &c. The proceedings were opened in a brief address by the Principal, Dr. Jelf, describing the principles upon which the college was founded, and the general good conduct of the students. The prizes, consisting of handsomely bound standard works in literature and science, were then delivered by the archbishop, upon the recommendation of the professors of the respective classes. At the close of the proceedings, the Dean of Westminster moved, and Mr. Justice Coleridge seconded, a vote of thanks to the Archbishop, who acknowledged the mark of respect, and in a general commendatory address did justice to preceptors and pupils, and incited the latter to renewed diligence by the hope of acquiring honours for themselves, fame for the institution in which they were reared, and advancing the well-being of the community at large.

Royal Geographical Society.—At the meeting of this Society last week, just as the reading of papers was about to commence, the meeting was surprised by the sudden appearance of Mr. Schomburgh, the celebrated traveller. He was enthusiastically greeted by the meeting, and cordially welcomed from the chair, on his safe return from his arduous and important explorations in British Guaiana. After returning thanks for his reception, Mr. Schomburgh gave the meeting some interesting details respecting the Indian tribes he had met with.

The Polish Ball.—Many reports having been circulated respecting this ball, the *Morning Chronicle* has published a statement, from which it appears that the ladies patronesses did not offer to put off the ball if desired by the Emperor of Russia, and that the Emperor did not offer 500*l.* as a contribution to the funds, as stated by some of the papers. It appears that the Duchess of Somerset, on his Majesty's arrival, conveyed to Baron Brunnow her anxiety that the Emperor should be made aware that the Polish ball was one which had taken place in former years; that it had been arranged this year before his Imperial Majesty's visit was expected, and that no mark of disrespect was intended to his Majesty by those concerned in its management. The message produced an answer from Baron Brunnow to the effect, that his Imperial Majesty could feel no objection to the ball, and that Baron Brunnow had received his Majesty's authority to contribute towards it any sum her grace might name. Her grace (having in the interim been made aware that the idea of accepting money from the Emperor would not be tolerated by the Poles), in acknowledging the offer did not name any sum; and none was sent. Baron Brunnow, however, on the day of the ball, having obtained twelve vouchers from some of the ladies patronesses, sent them to the office, where they were exchanged and paid for at the usual price; and thus the cost of twelve tickets constituted the whole of the contribution made by the Emperor or his representative to the funds. It is said that the clear profits of the ball, after paying all expenses, exceeded 1000*l.* Last year's ball produced about 600*l.* only.

The Nelson Testimonial.—The following is a translation of the letter which accompanied the Emperor of Russia's munificent contribution to the funds for erecting the Nelson Testimonial:—"London, June 7, 1844. My Lord Duke,—His Majesty, desiring to contribute to the erection of a monument which the national gratitude is now raising to the glory of Admiral Nelson, has charged me to request your obliging intervention to add in his name to the subscription already open the sum of 500*l.* The Emperor has judged that, to accomplish his purpose, he cannot do better than address himself to one whose name is inseparable from the most glorious recollections of England. Have the goodness to accept, my Lord Duke, the reiterated assurance of my highest consideration. (Signed) COUNT ORLOFF. To his Grace the Duke of Wellington, &c." Upon the receipt of the above, the Duke of Wellington immediately acknowledged it in a closely-written letter, occupying three sides of a sheet of writing-paper.

The Loss of the Manchester.—The accounts received this week confirm the statement in our last that not a soul has been spared to tell the tale of this melancholy wreck. At Cuxhaven hopes were entertained that some might have escaped by being washed ashore in the boats south of the Elbe, it being known that the vessel carried two boats, each capable of holding 20 persons; but that conjecture was soon set at rest by the bow of one and fragments of the other being picked up by the Victoria steamer. The Hamburgh steam ship had also conveyed to Hamburgh a portion of the wreck; but most parts of it were in small pieces from being dashed about by the breakers. Large quantities of cargo have been found, and some ladies' clothes, linen, dresses, collars, and stockings, the latter marked M. H. S., no doubt belonging to Mrs. Smith or her daughter, who were the only female passengers on board. Down the coast at Busum, and at Hedeibigenkoog, a quantity of manufactured goods have been cast ashore, and about 2000 bundles of twist. As the John Bull steamer came out of the Elbe on Wednesday week, a pilot was spoken for the purpose of ascertaining the latest information. The officers were informed that the wreck had been discovered, sunk in 12 feet of water, in the neighbourhood of the Reissen Sand, but the exact part could not be ascertained. Another party on board stated that the masts could be seen protruding through the bottom, but this assertion is considered as improbable. The Reissen Sand is situated about eight miles to the northward of the Vogel Sand, and separates the latter from the Marl Bank, the spot where it was at first supposed the vessel had been wrecked. None of the bodies have yet been recovered, but the friends of some of the passengers are at Cuxhaven, for the purpose of identifying them as soon as they are washed ashore. From the fact of a cabin clock and a watch being picked up, showing the same time, half-past one, there is no doubt that she was lost at that time on Sunday morning. The crew consisted of the captain, two mates, steward and stewardess, two engineers, and 15 others. The passengers were Mrs. Smith, aged 49; Miss Emily Smith, her daughter, aged 21; Mr. St. George Smith, her son, aged 26; Mr. Rothery, wool merchant, of Leeds; Mr. Frons, of Manchester; and another gentleman, whose name at present is unknown. The Manchester had two letter-bags on board, both of which were, of course, lost.

Colonial Bank.—On Monday the half-yearly meeting of the proprietors of this bank was held, Mr. John Irvine in the chair. No dividend was declared, the directors having recommended that the available balance of 8212*l.* be carried to the reserved fund. Although the hope was held out that improvement will eventually take place in the affairs of the Company, many of the shareholders seemed inclined to propose a dissolution as the readiest way of getting rid of an unprofitable concern. The report however was ultimately adopted without opposition.

Library of the late Duke of Sussex.—On Monday the sale of the first part of the extensive library of the late Duke of Sussex commenced at Evans's rooms. All the works in this sale, which will last 24 days, are classed under the head "Theology." There was a remarkably full attendance, and the prices realised were generally high.

The Irish Trials.—A public meeting of the inhabitant householders of the city of Westminster, convened pursuant to a requisition to that effect, by the high bailiff, was held on Monday in front of the portico of St. Paul's, Covent-garden, to take into consideration the proceedings of the Government for the subjugation of Ireland, and the persecution of O'Connell and others for their support of the rights of Irishmen, and to petition Parliament for the immediate release of the State prisoners. The High Bailiff presided, and was supported by Mr. T. S. Duncombe, M.P., Colonel Rawdon, M.P., Sir R. Bulkely, M.P., Mr. S. Harford, late candidate for Brighton; Mr. Feargus O'Connor, Mr. E. D. Davenport, Mr. Coppock, &c. Mr. F. O'Connor was as usual attended by a body of Chartists. Mr. Duncombe, Mr. Harford, Col. Rawdon, Rev. Dr. Wade, Mr. F. O'Connor, and other gentlemen, addressed the meeting, and resolutions condemning the recent trials as unconstitutional and illegal, were unanimously carried. Petitions to both Houses of Parliament founded upon the resolutions, and an address to Mr. O'Connell were also adopted. The number of persons present was about 7000.

The Convicts Barber and Fletcher.—The subjoined document, forming a declaration of the innocence of Barber by his fellow convict Fletcher, has been published by the solicitor on behalf of Barber in the late trials. Barber and Fletcher are now both on board the convict ship Agincourt, lying off Woolwich, and will sail in a few days for their destination. The witness whose name is appended to the paper is an officer of the convict vessel:—"June 28. I solemnly declare that, to the best of my knowledge and belief, William Henry Barber had no guilty knowledge that the will of Anne Slack was a forgery, or that it was otherwise than a legitimate and proper matter of business. As such it was introduced by me to him, as stated in my first examination at the Mansion-house. And I further declare, that to my knowledge and belief he had no guilty knowledge of either of the cases which have recently formed the subject of indictment. I make this declaration with no other motive than to do an act of justice to Mr. Barber as far as lies in my power.—Joshua Fletcher. (Witness) Matthew Hall Cuttriss" Another and still stronger declaration has since been published by Fletcher.

The Convict Dalmas.—In consequence of communications made to government, a respite for one week was granted to this convict on Saturday, in order to give time for the investigation of various circumstances which were left doubtful by the evidence of some of the witnesses. The convict had already taken leave of his daughters when he received the respite, which came upon him quite unexpectedly. On Tuesday and Thursday Drs. Sutherland and Monro, proceeded to Horsemonger-lane Gaol, by the authority of the Home Secretary, in order to examine his state of mind, the friends of Dalmas having repeatedly urged upon the attention of Sir J. Graham that during the last two years he has been subject to fits of mental aberration, brought on by incessant and severe study in conjunction with his chemical experiments. On Thursday evening, a reprieve during her Majesty's pleasure was received from the Home Office, at Horsemonger-lane gaol. Drs. Sutherland and Monro had previously had an interview with Sir J. Graham, relative to the convict's state of mind, and laid before him a report of their opinion, and the conclusion they had arrived at after the two recent visits they had paid to the convict. Sir J. Graham then carefully revised the whole of the evidence. The nature of the report of Drs. Sutherland and Monro is at present unknown, but it is conjectured that the conclusion they arrived at was that the mind of the convict was affected. After careful investigation, Sir J. Graham felt himself warranted in recommending Dalmas as a fit object of the Royal clemency, and a reprieve was accordingly forwarded to the prison on Thursday evening. It is not yet decided whether the prisoner will be transported for life, or confined during her Majesty's pleasure.

Anti-Corn-Law League.—The usual meeting of the League was held on Wednesday evening in Covent-Garden Theatre. Mr. G. Wilson presided, and opened the business of the evening in a short speech. The Hon. C. P. Villiers then addressed the meeting, and was followed by Mr. Cobden and Mr. Bright. At the close of the proceedings the chairman announced that the League would not meet again until Wednesday, the 7th August, which would be the last night of their re-assembling for the present season. Before breaking up he called on them to give three cheers for Mr. Villiers, Mr. Cobden, Lord Ducie, Lord Howick, and the other noblemen and gentlemen who had taken a part in their proceedings. The call was loudly responded to.

Proposed Modification of the Window Duties.—The following is the substance of a report on the proposed modification of the window duties for the purpose of insuring a better mode of ventilation in the houses of the metropolis, more particularly in the poorer districts, which has just been published by the Metropolitan Improvement Society. On the 27th April an application was made to the Chancellor of the Exchequer, by a deputation from the Metropolitan Improvement Society, and a deputation from the Master Carpenters' Society, for a modification of the window duties. The object was, that the healthfulness and comfort of dwelling-houses might be improved without increasing the present burthen of the assessed taxes. Dr. Southwood Smith and Mr. Toynbee, surgeon of George's Dispensary, accompanied the deputation, and stated as the result of their professional observations, that the present system operated as a discouragement to light and ventilation, and had a tendency to promote disease. In reply they were told by Mr. Wickham, Chairman of Stamps and Taxes, who was present during the interview, that houses might be properly ventilated without being thereby rendered liable to the window duties, by means of perforated plates of zinc placed in external walls. It now appears that Mr. Wickham was in error, that gentleman not having reflected at the moment that any aperture in an external wall that admits *air* will also admit *light*, and therefore would come within the legal definition of "windows or lights," chargeable by the existing Act. Mr. Pressley, Secretary of Stamps and Taxes, in an official communication subsequently received, explains distinctly that every aperture admitting light, however made, and through whatever material, whether in a cellar, water-closet, &c., of a house, is liable to the window duties, adding that the only answer that can be given to the question submitted by the society is, that perforated plates of zinc or any other material, if so perforated as to afford light, are chargeable, but not if so as to serve the purpose of ventilation only, and not that of giving light. Thus it appeared even doubtful, whether the air bricks sometimes placed in the space between the floor and ceiling of a room would not be chargeable to the window duties if the law were strictly enforced. The members of the two deputations were, therefore, desirous of submitting the fact (one of serious practical moment) to the Chancellor of the Exchequer, and they accordingly solicited an answer to the following questions:—1. Whether Government will introduce any measure corresponding in principle with the draft of the Bill left with the Chancellor of the Exchequer on the 27th April, for fixing a maximum to the existing window duties, beyond which new openings might be made for light and ventilation, without subjecting the occupants to additional charges? And should the Chancellor of the Exchequer not be prepared with any such measure, whether, 2. Government will pass a short Bill to exempt from taxation, upon sanatory grounds, all unglazed openings in casement stories and closets of every description, that the evils complained of may in some degree be palliated, if not wholly removed? Either measure might be so framed as to be attended with little or no loss to the revenue, and the former, especially, would be gratefully received by the public as a most valuable boon. In reply to this, Mr. Goulburn declines to sanction either of the proposed alterations of the law, it being evident, he says, that either of them, if acceded to, would enable parties to have windows without the payment of the tax. Mr. Goulburn also says, "There has been no mistake, as the parties suppose, on the part of Mr. Wickham, in stating that openings for ventilation might be made which would not be chargeable as windows, and I cannot think it at all inconsistent with such a statement to decline expressing beforehand a general opinion as to whether certain openings when made would or would not be considered as windows, and as such liable to charge."

St. Stephen's, Walbrook—It was understood in the courts of law on Wednesday that a motion was to be made in Chancery in the course of the day, for the appointment of a receiver of the rents and other moneys of this parish. It is said however that before the hour appointed for the hearing of the cause the counsel on either side entered into an arrangement by which much expensive litigation will be avoided. The principal points of this arrangement are said to be these:—First, that Alderman Gibbs shall immediately pay over to the present churchwardens all the rents and money he may have received since the date of his published account—that is to say during the present year; secondly, that all such moneys shall be applied to the current expenses of the parish; thirdly, that an action at common law shall be tried for the purpose of deciding who are legally the churchwardens in the parish; and moreover that all the accounts embodied in Alderman Gibbs's published statement, and which, it will be recollected, extend over a period of 18 years, shall be sent with papers and vouchers, to the office of the Accountant-General in Chancery,

under a decree of the Court, to be taken by consent, with a view to their being examined before a Master, and by him allowed or otherwise. It is added that the action at common law, by which Alderman Gibbs's tenure of office as churchwarden will be decided, is to be tried upon an issue as to the custody of the vestry books, which are at present held by the churchwardens elected in open vestry (Messrs. Rock and Flight), and of which Alderman Gibbs endeavours, as plaintiff, in a suit to be tried in the Court of Common Pleas, to obtain possession.

Shoreditch.—A meeting of the parishioners of St. Leonard's, Shoreditch, which commenced at 3 o'clock and did not terminate until 12 o'clock at night, was held last week in the parish church for the purpose of making a rate for the relief of the poor. As the parishioners entered the church, the curate was reading prayers, and after a lapse of a few minutes the service concluded. The conduct of the party was tumultuous throughout. The chairman repeatedly called the meeting to order, amidst groans, yells, kicking against the pews, and cries of Shame. It was moved that a rate of 1*s.* in the pound be made to meet the expenses. An amendment was moved that a rate of 8*d.* in the pound be granted, and carried by a large majority.

Wood-Paving.—A Court of Sewers was held on Tuesday at Guildhall, at which about 30 Commissioners were present. Alderman Gibbs presided. The question of wood-paving again came under discussion, in consequence of the attendance of deputations from the inhabitants of Fleet-street and St. Paul's Churchyard, soliciting the confirmation of a resolution for paving these great thoroughfares with wood, which had been passed on the previous court-day. Mr. Peacock moved that the resolution be rescinded; which having been seconded, Sir P. Laurie observed that he was opposed to wood-paving, not only because it was unsafe, but from a conviction that it would entail a greater expense than stone on the citizens, and he therefore thought he was rendering the inhabitants an essential service by supporting the motion for rescinding the resolution. The motion was, after some further observations, put and carried, thus deferring wood-paving for the present. The deputation, consisting of about 50 persons, expressed disappointment at the result, and declared their intention to procure the convening of wardmotes as early as possible.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending June 29.—West Districts, 160; Northern, 198; Central, 150; Eastern, 212; Southern, 244; Total, 964. Weekly average for the last five years, 946.

Provincial News.

Alverstoke.—A handsome tablet has been erected in Alverstoke Church, near Gosport, to the memory of the officers and soldiers of the 44th Regiment who fell in the Affghan war, over which hangs the colours of that ill-fated regiment. The following is the inscription:—"Sacred to the memory of Colonel T. Mackrell, A.D.C. to her Majesty; Major W. B. Scott, Capt. T. Swaine, Capt. R. B. M'Crea, Capt. F. R. Leighton, Capt. T. Robinson, Capt. F. C. Collins, Lieut. W. H. Dodgin, Lieut. W. G. White, Lieut. W. G. Wade, Lieut. H. Cadett, Lieut. S. Swinton, Lieut. F. J. C. Fortye, Lieut. A. W. Gray, Paymaster T. Bourke, Lieut. and Quartermaster R. B. Hallahan, Surgeon J. Harcourt, Assistant Surgeons W. Balfour and W. Primrose, and 645 non-commissioned officers and soldiers of the 44th Regiment, who fell upon the field of battle in the disastrous Affghan war of 1841 and 1842. They sank with arms in their hands unconquered, but overpowered by the united horrors of climate, treachery, and barbarous warfare; their colours, saved by Capt. J. Souter, one of the few survivors, hang above this stone, which is erected to their memory by the officers of the 44th Reg.—June, 1844."

Bedford.—The *Herts County Press* states that "a circumstance, the like of which has never been known within the memory of the oldest inhabitant of Beds, occurred in this county on the 20th ult. Mr. Jeffreys, a farmer, residing at Great Barford, whilst his neighbours were sowing barley, cut and carted a quantity of the same grain. The barley was the produce of a field that had been severely injured by the hail storm of last year, and the occupier had it ploughed up for the purpose of sowing it with wheat, but observing a good deal of the grain growing, he allowed it to stand, and the result has been that he has obtained an excellent crop, a fine sample of which was exhibited in Bedford market on Saturday last."

Bolton.—A dreadful explosion occurred at the woollen mill of Alderman Brooks, of Manchester, on Monday morning, when the steam-boiler blew up with a report like a piece of artillery. The engine-house stood at the end of the factory, and on the other side there was a low building occupied as a warehouse, with working-rooms above. The side of the mill at the end where the engine stood was shattered to its base, the walls being rent, and the windows completely demolished. The entire range of building was shaken as if by an earthquake. Three persons were killed, and others wounded. The damage done is nearly 2000*l.*; and until the factory be rebuilt several hundred workmen will be thrown out of employ.

Cirencester.—A public meeting of the shareholders and supporters of the Agricultural College was held here on Monday, to receive the report of the committee of management. Earl Bathurst was in the chair. The attendance was numerous and influential; Dr. Daubeny, of Oxford, was among the number. The report was satisfactory. It is intended to hold a public meeting at Southampton in aid of the scheme, on the occasion of the great annual meeting of the Agricultural Society of England in that town. A farm of about four hundred acres, nearly a mile from Cirencester, on the road to Stroud, called Port Farm, belonging to Earl Bathurst, is to be the experimental farm for the intended college.

Durham.—The pitmen's strike still continues, and there is no prospect of its speedily coming to a close. Several coal-owners have commenced ejecting their workmen from the houses occupied by them. At Pittington, Haswell, Hetton, and Rainton, several were removed last week. Some of the men who have left the union have gone to other collieries than those at which they worked last year, and are now in the receipt of good wages. One of the agents of the Marquess of Londonderry proceeded to Ireland on Saturday to bring over labourers from the lead mines in that country—so that there will be speedily a great increase in the number of men employed in the collieries. Operations for sinking a new colliery at Seaham Park, by a wealthy company, on the estate of Lord Londonderry have been commenced. This colliery will be on an extensive scale, and should it be successful, will probably be one of the most important and profitable in the county.

Manchester.—A meeting to be held on the 8th of August has been called by the mayor, on a requisition most respectably signed, for the purpose of considering the propriety of establishing "public parks, walks, and playgrounds" in the neighbourhood of this town.

Portsmouth.—It is said that the Caledonia, 120, St. Vincent, 120, and Camperdown, 104, the flag-ships at Plymouth, Portsmouth, and Sheerness, are to proceed to sea immediately, and that instead of cruising in the Channel they will go on to Gibraltar. The Albion, 90, the flag-ship at Cork, will join them at Gibraltar. It is alleged that this sudden movement is in consequence of the state of affairs between France and Morocco, and the failure of the mediation of this country to effect an amicable arrangement between the belligerents, it being deemed expedient to have a squadron of observation on the coast to watch the proceedings of the French squadron under the command of His Royal Highness the Prince de Joinville.

Sudbury.—The Bill for the disfranchisement of this borough is now in Parliament, having been read a second time last night. It is prepared and brought in by the Attorney and Solicitor-General, and is contained in a space of 28 lines—a remarkable circumstance for an Act of Parliament. We quote from the preamble in order to show the grounds upon which the Ministry have thought themselves justified in taking this extreme course. It says—"Whereas an Act was passed in the 7th year of the reign of Her Majesty, entitled 'An Act for appointing Commissioners to inquire into the existence of Bribery in the Borough of Sudbury,' whereby, after reciting that there was reason to believe that the practice of bribery at elections of members to serve in Parliament for the borough of Sudbury had long prevailed in the said borough, and that bribery to a great extent had been systematically committed there at the last election of members to serve in Parliament, certain Commissioners were therein named and appointed for inquiring into the manner in which the last election (in 1841) of members to serve in Parliament for the said borough had been conducted, and whether any bribery had been committed at such election, and into the particulars of such alleged bribery, as in the said Act is more fully set forth; and by the said Act the said Commissioners were directed from time to time to report to Her Majesty the evidence which should be taken by them, and what they should find concerning the premises; and whereas the said Commissioners made their report in writing to Her Majesty, dated the 12th day of March, 1844, and thereby, after detailing various illegal practices before and during the election, reported finally that systematic and extensive bribery prevailed at the last election of members of Parliament in the said borough;—be it therefore enacted, &c. that the borough of Sudbury, in the county of Suffolk, shall, from and after the passing of this Act, cease to return any member or members to serve in Parliament." Thus, no provision is made at present for the filling up of the vacancy that will occur in the House of Commons, by transferring the elective franchise to another place. It is said that at the general election of 1761, caused by the demise of George II. and the accession to the throne of his grandson George III., Sudbury publicly advertised for a "highest bidder" for the seats in its gift.

Windsor.—All who have visited Windsor-park and the grounds adjoining Virginia Water will remember a beautiful and retired spot called "The Ruins." The name is derived from some architectural antiquities brought from Greece by Lord Elgin, and which were so disposed in this locality, under the direction of George IV., as to represent the remains of a Grecian temple. The principal ruins consist of several columns, and various statues are placed on either side of the approach and in different parts around. Several of them are of great antiquity, and in a good state of preservation; and others date from about the middle of the 16th century. On Sunday week, according to the statement of the man appointed to show the public the cascade, a statue of Flora was thrown down from the spot where it stood, with great violence. The fall broke the head completely off, and also broke the right arm in two places. This could not have resulted from accident, as the strength of two or three persons must have been required to remove the figure from its pedestal. The papers state that the destruction of this statue, though the most recent, is not by any means a solitary instance of the mischievous conduct of some of those who thus abuse the privilege granted to the public of viewing these splendid grounds and Virginia Water. Various other works of art in the Park bear proofs of the same destructive spirit. There was formerly a row of statues on each side of the approach to the principal group of columns. Now the uniformity is entirely destroyed, and the ruins spread around are far more numerous than agreeable to behold. Very few of them have entirely escaped; some are carved upon the breast, or some conspicuous portion of the body, with the names of visitors who have been thus anxious to expose themselves to the contempt of all right-minded persons. Most of the statues, however, are even more mutilated; the heads having especially formed favourite points of attack. There is little doubt that a continuance of such conduct will cause a suspension of the privilege by which the public are now admitted to Windsor-park.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1587*l.*; Birmingham and Gloucester, 2858*l.*; Eastern Counties, 4687*l.*; Edinburgh and Glasgow, 2197*l.*; Great Western, 20,329*l.*; Grand Junction, 9359*l.*; Glasgow, Paisley, and Ayr, 1305*l.*; Great North of England, 1595*l.*; London and Birmingham, 19,218*l.*; South Western, 7349*l.*; Blackwall, 1418*l.*; Greenwich, 867*l.*; Brighton, 4272*l.*; Croydon, 502*l.*; Manchester, Leeds, and Hull, associated, 6995*l.*; Midland Counties, 3175*l.*; Manchester and Birmingham, 3253*l.*; North Midland, 5077*l.*; Newcastle and Carlisle, 1635*l.*; South-Eastern and Dover, 4585*l.*; Sheffield and Manchester, 581*l.*; York and North Midland, 1923*l.*—The introduction of Mr. Gladstone's Railway Bill into the House of Commons has created considerable alarm in the railway community, and deputations from most of the companies are now in town for the purpose of taking steps to oppose it. A meeting was held last week at which the representatives of the following companies were present:—Liverpool and Manchester, Manchester and Birmingham, Great Western, South-Western, Great Midland, York and North Midland, Great North of England, Newcastle and Darlington, Sheffield and Manchester, Sheffield and Rotherham, Manchester and Leeds, Hull and Selby, London and Brighton, Bristol and Exeter, Bristol and Glocester, Eastern Counties, Northern and Eastern, and South-Eastern. A resolution was unanimously adopted to the effect, that the Government Railway Bill contains provisions of a most objectionable character as affecting the interests of railway companies; and that the reports on which the Bill is founded lead to the conclusion, that a system of Government interference with railways is contemplated, which is wholly uncalled for and inexpedient as regards the public interests, and should be strongly resisted by existing railway companies. It was considered that the attempt to pass such a Bill at so late a period of the session, and with so short a time for the due consideration of its details, was most unjust, and the meeting resolved to obtain an interview with Sir R. Peel. This interview took place on Monday, and Sir R. Peel listened with great attention to the case of the companies, which was laid before him at considerable length. A long conference ensued, in which the directors enlarged on the objectionable character of the whole measure, both in its principle and details, and concluded by expressing a hope that, at the present late period of the session, the Bill would be postponed. Sir R. Peel declined acceding to the request of the deputation for a postponement until next session.

IRELAND.

Dublin.—The rumour is again revived that Government intend to take measures for the prompt suppression of the Repeal agitation, which, it is now evident, has not been checked by the suspension of the monster meetings or by the legal proceedings subsequently adopted. In the meantime, the Lord Chancellor continues to supersede magistrates who have taken any part in the agitation, and Mr. Cornelius O'Brien, who presided over a recent meeting at Castle Lyons, for the purpose of collecting Repeal rent, is among those who have been dismissed since our last.—It is announced that Lord de Grey will leave Dublin on the 13th, and that Lord Heytesbury, who has been appointed his successor, will arrive at the Castle on the 16th.—The weekly meeting of the Repeal Association took place on Monday, Mr. Maher, M.P., in the chair. Mr. O'Neill Daunt, after handing in some money, said that the State prosecution was to have extinguished O'Connell and his influence for ever; yet he had to announce to them that not half an hour before, the Corporation of Dublin had offered to Mr. O'Connell the mayoralty of the city for 1845. The Liberator had thought proper to decline the offer, but the moral effect was the same; and the fact showed that he never stood higher in the estimation of the people than at present. Several gentlemen addressed the meeting, after which Mr. H. Grattan, M.P., spoke at some length in support of a resolution, requesting the Orange party to abstain from walking in procession in honour of the battle of the Boyne. He said, that it had come to his knowledge at Rome that overtures had been made by certain individuals acting, as he supposed, on behalf of the English Government, to his Holiness the Pope, which constituted an infraction of the statute of *premunire*, and he pledged himself to put into the hands of any Protestants or Orangemen who would accept it sufficient proof of the fact to enable articles of impeachment to be brought against the individuals in fault. He alluded to the attempt which had been made at the Court of Rome to induce the Pontiff to exert his influence to separate the clergy of Ireland from O'Connell and the repeal movement. He did not charge Sir Robert Peel with having done this, but he asserted that it was done, and he could prove it. As to

the Minister having employed individuals to enter into the negotiation, he was reluctant to assert so much, because the maxim, *Qui facit per alium facit per se*, would apply then, and he should be equally guilty of high treason as if he in person had committed the act which had been attempted. The answer of the Pope to the application he had referred to was, of course, an indignant refusal to interfere; but the insult to the community was equally as great as if the attempt had succeeded. He had no doubt that "H. B." would take this proceeding as a subject for one of his admirable caricatures. After some further observations the hon. gentleman concluded by calling on the people to stand together, and they would soon get rid of the Ministerial vermin that had got about the throne. Mr. D. O'Connell, Jun., announced, that the imprisoned traversers were in excellent health and spirits. They were actually getting fat, and it was no wonder they were, inundated as they were with good things in the shape of presents from their friends. Yesterday they had been presented with a large cake, three feet in diameter and weighing 50lbs., and they had received at the same time a sturgeon from Limerick, which was seven feet long and weighed 200lbs. The rent for the week was 2152*l.*, making the amount of 14,523*l.* received during the five weeks of Mr. O'Connell's imprisonment.

SCOTLAND.

Perth.—The local papers state that the late rains came as opportunely for the young grouse as for the growing crops. On all the low grounds where the drought had dried up the rivulets and springs, the rains, which in the Highlands preceded the fall in the low country by nearly a week, came just as the birds were breaking the shell; and its good effects are now to be seen in numerous broods and large coveys upon almost all grounds. The bilberry, viburnum, and other mountain plants, which form the chief food of the grouse, have put out a new growth in consequence of the change of the weather, and the fresh shoots will afford an abundant supply till the fruit is ripe. There are now few of the Highland shootings in the market; there are two or three of Lord Glenlyon's above Blair; another in Strathtummel, and one or two smaller muirs lower down; but, with these exceptions, all in this county are engaged.

Law.

HOUSE OF LORDS.—*The Irish Trials. Writ of Error.*—The House assembled on Thursday to hear the arguments on the writs of error in the case of the Queen v. O'Connell and others. The following counsel appeared on behalf of the plaintiffs in error: Sir T. Wilde, Mr. Hill, Q.C.; Mr. F. Kelly, Q.C.; Mr. Peacock, Mr. J. W. Smith, Mr. Lahee, Mr. Close, Sir C. O'Loghlan, Mr. Crampton, and Mr. Sergeant Murphy. Counsel for the Crown: The Attorney-General, the Solicitor-General, the Attorney-General for Ireland, and Mr. Waddington. Lord Denman, Chief Justice Tindal, Barons Parke, Alderson, Gurney; Justices Patteson, Coltman, Williams, and Maule, were the Judges present. All the Law Lords were present except Lord Langdale. Sir T. Wilde stated, that in order to economise time, counsel had agreed that they would not all address their Lordships on the same points. He would himself, with Mr. Peacock, address the House for Mr. O'Connell, and be followed by Mr. Hill for Mr. Steele, and Mr. Kelly for the others. The Lord Chancellor informed counsel that the circuits are fixed, and the learned Judges must go next Wednesday; and if the arguments be not completed before that time, it will be impossible to finish the case during the present session. Sir T. Wilde said they would bear that in mind; and as far as was consistent with their duty, they would condense their arguments as much as possible. After some further discussion between their Lordships and the Attorney-General on the right of the appellants to three replies, which was decided in favour of the latter, Sir T. Wilde opened the case. It is impossible within our limits to give any kind of abstract of his speech, which travelled over all the points so frequently raised during the trials, and dwelt particularly on the form of the indictment. At the close of his address, the House adjourned.—The House assembled again yesterday at an early hour, and Mr. Peacock addressed their Lordships at great length on behalf of Mr. O'Connell. Mr. Hill followed on behalf of Mr. Steele, and not having concluded his arguments at 5 o'clock, the Lord Chancellor said that public business made it necessary to adjourn to this day at 10 o'clock.

COURT OF EXCHEQUER.—*Wood* v. *Peel.*—*The Derby case.*—This cause, which has excited such interest in sporting circles, came before Baron Alderson and a special jury on Monday. The Court was crowded to excess. Several witnesses were examined, the main point being to ascertain whether the horse was of the age represented, and whether his identity could be established. On Tuesday counsel for plaintiff stated that, in obedience to the Judge's suggestion, they had ordered the horse, Running Rein, to be brought for the inspection of the Court, but he had been removed from the stables nobody knew where. Counsel disavowed all knowledge of this fraud on the part of Mr. Wood; but being unable to proceed further without the horse, he was compelled to withdraw from the inquiry. He therefore submitted to a verdict for defendant. but he could not do so without expressing, on behalf of Mr. Wood, that gentleman's assertion that he had not had any part in the fraud, of which he had been indeed the victim.—Mr. Baron Alderson: I dare say; there is nothing to show the contrary; he bought the horse with his engagements.—Mr. Cockburn: Yes, he did so, and at a time when he had every reason for believing that he was what he was represented to be, as he had just undergone the ordeal of an inquiry at Newmarket. He therefore trusted that it would go forth to the world that Mr. Wood, whom he believed to be an honourable man, was not a party to these practices. Having said thus much, he had only now to consent to the jury returning a verdict for the defendant.—Mr. Baron Alderson said, Gentlemen of the Jury, you have only to return a verdict for the defendant, the plaintiff, as you have heard, declining to contest the question any further. There is, therefore, an end of the case; but before we part, I might be allowed to say that it has produced great regret and disgust in my mind. It has disclosed a wretched fraud, and has shown noblemen and gentlemen of rank associating and betting with men of low rank, and infinitely below them in society. In so doing, they have found themselves cheated and made the dupes of the grossest frauds. They may depend upon it that it will always be so when gentlemen associate and bet with blackguards. The jury then found a verdict for the defendant.

COURT OF QUEEN'S BENCH.—*The Queen, on the Prosecution of Thomas Kinder, against Lord Ashburton, the Hon. Francis Baring, and Humphrey St. John Mildmay.*—Mr. Bodkin stated that the prosecutor, the defendants, and one Robert Ponsonby Staples, agreed in September, 1825, to purchase, in Mexico, certain lands known by the name of the Patos Parras and Bonansa estates, for the sum of 200,000*l.* sterling, and that Kinder and Staples paid the sum of 40,000*l.* in part of the purchase-money, and that Kinder, Staples, and the defendants were thereupon let into the possession of the estates; that the defendants, then intending to defraud, oppress, and impoverish Kinder and Staples, and to deprive them of the benefit of the said contract, and to obstruct and prevent the due course of law and justice, did conspire and confederate to bribe and corrupt certain members of the Congress of Mexico belonging to the House of Deputies of that country, to induce the said deputies to cause and procure to be passed a law which should have the effect of avoiding and setting aside the said purchase and contract, by enacting that aliens were incapable of purchasing real estates in that country; and that a sum of 2200*l.* sterling was given by the defendants to the said deputies in consideration of their voting in favour of the law. Succeeding counts in the indictment made some variation in the mode of expressing the charge; and the defendants pleaded "Not guilty" to the whole. Mr. Erle (with whom were Mr. Cockburn, Mr. Crompton, and Mr. Bodkin) then proceeded to state the facts of the case. As his address consisted altogether in a very detailed exposition of the circumstances necessary to compose the bulk of the charge, we are unable to find room for any detailed report of the speech or evidence, more particularly as the facts are stated by Lord Denman in the following summing up. The defendants refused to give any evidence on their side, but pleaded not guilty. Lord Denman then proceeded to sum up the case to the jury. Having stated the general nature of the charge, and the purposes for which the defendants were said to have entered into the conspiracy, his Lordship adverted to the purpose imputed, of bringing ruin upon Mr. Kinder. His Lordship, in reference to this part of the case, thought it material to refer to the fact that the Messrs Baring had allowed Mr. Kinder to remain 16,000*l.* in their debt. With regard to the purchase of the estate in question, it was probable that Mr. Alexander Baring (Lord Ashburton) was of opinion that Kinder would be as well pleased to get rid of his bargain as the Messrs. Baring themselves. No notice, however, was given to him of the steps which were taken for that purpose, and it was to be regretted that Lord Ashburton had not fully communicated his proceedings to Mr. Kinder, from whom it was difficult to understand why they should be concealed, as it was to be presumed that his wishes were the same as those of Lord Ashburton upon the subject. With regard to the present charge, it depended entirely upon the construction which the jury would be disposed to give to that part of the correspondence which passed between Messrs. Baring and Messrs. Nolte. Before the jury could find that the charge was established, they must find that the three eminent persons who were defendants in the indictment entertained in common the purposes which were imputed to them, and that they had acted together for the attainment of those purposes. In order to justify such a finding, it would not be sufficient to be convinced that Messrs. Baring had eager wishes for the termination of their contract, or that they had with an imprudent confidence invested their agents with certain powers, blindly disregarding the manner in which those powers would be used. It would be necessary to go farther than that, and to be convinced that the bribery committed by the agents in Mexico was the result of a conspiracy formed between the defendants in London. His Lordship then proceeded to go minutely through the whole of the documents given in evidence; and with regard to a particular part of the bill in Chancery, charging defendants with having directed the bribery, his Lordship observed that the answer to it in the answer to the bill was not very direct or satisfactory. With regard to this point, the question was, whether before the act of the Mexican legislature, and with a view to its being passed, Mr. Baring had authorised his agents in Mexico to administer bribes to the members of the House of Assembly in that country. If the jury were of opinion that Mr. Alexander Baring had so done, they would then consider how far Mr. Francis Baring and Mr. Mildmay were united with him in that scheme. If the jury were of opinion that all three had a common purpose, they would inquire whether the defendants contemplated, as the result of the conspiracy, that they would be able to get rid of the purchase, and whether they were determined to secure the attainment of that object without any reference to the effect which it might have upon the interests of Mr. Kinder. If they decided this proposition in the affirmative, they would say next whether it did or did not appear from the correspondence between Messrs. Baring and their agents, as well as from the charge and denial of that fact in the bill and answer, that the means whereby the act of the Mexican Legislature was to be procured was through the administration of bribes to the members by the agents of Messrs. Baring, acting with the authority of their principals. These were the questions which he thought it proper to submit to the jury, and which, from the importance of the case and of the parties, required the most serious consideration. The jury, after an absence of about an hour and quarter, returned a verdict of Not guilty.

ARCHES COURT.—*The Office of the Judge Promoted by Titchmarsh* v. *Chapman.*—Sir H. Jenner Fust gave judgment on the admission of an allegation in this case, which was a proceeding in the form of articles under the Church Discipline Act against the Rev. Herbert Chapman, vicar of Basingbourne, Essex, for refusing to bury the body of a child named Jane Rumbold, the daughter of parents belonging to the sect known as Independents; and the present allegation assigned the grounds upon which the reverend defendant had so refused. The case has been already reported, and it will be remembered that the main points on which the defence rests, are that the child had been baptised by a minister belonging to the sect of Independents—that that baptism is an heretical baptism, affording none of the privileges of a valid baptism—that burial in the churchyard of the parish is one of those privileges to which, therefore, this child was not entitled; and besides this, that the parties promoting the present proceedings deny that the Church of England is a true and apostolic Church, and are, consequently, by the canons of that Church excommunicate, and not able to promote the office of the Judge against a member of the Church. These grounds of defence are set forth in the articles of the allegation now offered for admission, through which the learned judge travelled with great minuteness. He considered that these articles did not contain any sufficient answer to the charge brought against the reverend defendant. As to the heretical baptism pleaded, the question was, whether the baptism performed upon this child was or was not a valid baptism, and the Court was unable to distinguish the present case from that of Martin *v.* Escott, in which the Privy Council had held that the baptism performed by a Dissenting minister was valid. As to the objection which was founded upon the incompetency of the present parties to promote the office of the judge, it could not be upheld. By the 53d of Geo. III., c. 127, "no civil penalties or incapacity whatever" now attached to excommunication, and an inability to set into motion the Ecclesiastical Court would be a civil penalty. But were these parties excommunicate? They might think the Church of England not the true and apostolic Church, but Linwood and other civil law authorities all held that excommunication, even *ipso facto*, required a declaratory sentence, and here no sentence of excommunication had passed. It would be of no benefit to the parties to admit any part of the allegation; and the Court would consequently order it to be rejected.

POLICE.—*The Poisoning Case at Stepney.*—On Saturday Mr. Belaney was brought upon remand before Mr. Broderip, at the Thames Police-office, charged on suspicion with having caused the death of his wife, by administering to her prussic acid, on Saturday, the 8th ult., at their lodging in Green-street, Stepney. The interest excited was intense, and a great number of Mr. Belaney's friends were present in the court. Mr. Hayward, from the office of Mr. Maule, solicitor to the Treasury, addressed the magistrate, and said that it was only on the previous day he had been instructed by the Government to prosecute in this case. He therefore had time merely to glance over the lengthened depositions, and as the sessions would commence on Monday, it would be utterly impossible for him to get the case properly up within that short period. He therefore requested that the prisoner might be remanded for a few days so that the trial might not take place until the session commencing in August.—Mr. Broderip, addressing Mr. Clarkson, asked whether he had any objection to that course?—Mr. Clarkson, so far from having any objection, most heartily concurred in the proposal. Indeed, had it not been made, he should himself have preferred a similar request on the part of the unfortunate gentleman at the bar. He was gratified, on the part of his client, that the case had been taken up by the Solicitor to the Treasury, for he was satisfied that the prosecution would be carried on in a fair and candid spirit. The time which would elapse between this and the August session would allow a fair opportunity for getting the case properly up, both as regarded the prosecution and the defence. Every fact which could possibly be brought against the prisoner, could be elicited, whilst at the same time his friends and advisers would have an opportunity of meeting the charge, and of proving his entire innocence of the crime imputed to him. They all believed him perfectly innocent of the crime laid to his charge, and of which he would undertake to say no jury in the world would find him guilty.—Mr. Broderip said, that was a question which only a jury could decide. As to the application for delay he thought it well founded, and was happy to find that no opposition had been offered. In so serious a case, involving as it did other inquiries, justice could not satisfactorily be done if the proceedings were hurried on to the sessions commencing on Monday next, as no proper time would be allowed for a due preparation of the briefs. Inspector Haynes was then bound over to prosecute, and the witnesses entered into recognizances to appear at the August session.

SPORTING.

THE LATE DERBY.—*Running Rein Case.*—The noblemen and gentlemen of the Jockey Club, several proprietors of race-horses, and others interested in the honour and prosperity of the turf, intend to present Lord Geo. Bentinck with a piece of plate, to mark their sense of the immense service he has rendered to the racing community, by detecting and defeating the attempt at fraud exposed in the late trial in the Court of Exchequer. The subscription is to be confined to 25*l.*, and from the number of names already down at Messrs. Weatherby's, comprising some of the highest on the turf, it will no doubt be a very large one.

BIRTHS.—29th ult., at 39, Grosvenor-place, LADY LYTTELTON, of a son—29th ult., at Warborne, Hants, the lady of J. R. CARNAC, Esq., of a daughter—29th ult., in York-street, Portman-square, the lady of J. FARRELL, Esq., of a daughter.

DIED.—11th ult., at the Vicarage, Hatfield, Broadoak, Essex, MARY JANE HALL, only daughter of the Rev. T. F. Hall, aged 4 years; also, on the 29th ult., ROBERT I. HALL, the eldest son of the above-named gentleman, aged 6 years, grand-children of Sir R. Affleck, Bart., Dalham-hall, county of Suffolk—22d ult., in London, after many months of suffering, W. SIMPSON, Esq., of Brook-house, Cambridge—23d ult., at the residence of R. J. Peel, Esq., Burton-on-Trent, J. PEEL, Esq., of Knowlemere, in the county of York—24th inst., at Belmont-place, Wandsworth-road, MARY ANN PALMER, the beloved wife of Henry B. Palmer, woolstapler, Bermondsey—26th inst., in Portman-square, C. MORRIS, Esq., aged 76—26th ult., at Woodford, Essex, ELIZ. MALLARD, wife of Peter Mallard, jun., Esq., of Woodford, and youngest daughter of the Rev. T. Bourdillon, vicar of Fenstanton, Hunts.

WANT PLACES.—All Letters to be post-paid.

JAMES ROBERTS (Author of "A Comprehensive View, or a New Era in the Culture of the Vine under Glass"), being yet disengaged permanently, begs to say—from the many letters he has received from Gentlemen Amateurs on the Culture of the Vine, as to their failure and only partial fruitfulness, which tends to create great disappointment in the culture of this delicious fruit—that at present he is at liberty to wait upon any one professionally at a reasonable charge, when, from inspection and improved points of culture, they will be enabled to produce regular uniform crops of this long-neglected but most generous of all Exotic Fruits, the result of the general failure of which is a total misapplication of its unlimited powers.—All Letters addressed Hampsthwaite, near Harrogate, Yorkshire, shall be duly attended to.—July 1, 1844.

AS GARDENER, or as FOREMAN and PROPAGATOR in the Houses of a Nursery.—A steady, active young Man, who understands the growing of Grapes, Pines, and Early Forcing.—Direct to C. M., 11, Cumberland Market, Regent's Park.

AS HEAD GARDENER.—Mr. G. MILLS, Gardener, Gunnersbury Park, Acton, Middlesex, wishes to recommend a single young Man to any Nobleman or Gentleman in want of a competent and trustworthy servant in the above capacity. He is 27 years of age, and has served him two years in the above establishment. Wages expected, 65*l.* per year, with house, coals, vegetables, &c.

AS GARDENER.—A Single Man, aged 34, who perfectly understands his business in all its branches—the Vinery, and all kinds of Forcing, Fruit, Kitchen, and Pleasure garden. Can be highly recommended by the gentleman he has just left, where he lived upwards of nine years. Has no objection to live in the house or out. Direct A. B., care of Mr. King, Nurseryman, Finchley.

AS GARDENER.—A young Man, aged 28, who has a thorough practical knowledge of his business in all its branches, and whose character will bear the strictest scrutiny. Direct to William Thomson, Gardener to George Byng, Esq., M.P., Wrotham Park, Barnet, whom the Advertiser has served as Foreman for six years.

AS GARDENER.—A respectable, sober, active young Man, aged 24, who understands the Management of the Kitchen and Flower Garden, Plant, Stove, and Greenhouse; also the Forcing of Grapes, Cucumbers, and Melons. Can have a good character from the situation he now holds. No place will be accepted where only one house requires to be attended to.—Direct M. M., MUDIE and SONS, News-agents, 15, Coventry-street, Haymarket, London.

TO NURSERYMEN AND SEEDSMEN.

AS SHOPMAN.—A young Man who has a general knowledge of the Seed business, having been in one of the principal Seed houses in London for a considerable time. Satisfactory references can be given as to character and ability. Direct to A. B., at Messrs. Henderson's, Pine-apple-place, Edgeware-road, London.

AS BAILIFF.—A married Man, without encumbrance, who understands Farming and Stock. His Wife can take charge of the Dairy and Poultry, if required. Are willing to make themselves useful, and can have a good character from their employer.—Direct to J. T., Mr. Brown's, 38, Exeter-street, Lisson-grove, Marylebone.

A Middle-aged Man, who has been engaged in the NURSERY and SEED TRADE is desirous to engage in a Situation of trust and responsibility. He is of business habits, a good salesman and penman. Any one wanting a person with a good knowledge of the Trade can have satisfactory reference, by applying to Mr. W. BRISTOW, Seedsman, Knightsbridge, who can recommend the Advertiser with confidence.—Direct to Mr. W. Beale, Swaffham, Norfolk.—July 6.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

NEW THUNBERGIAS.

JOSEPH FRYER begs respectfully to offer two very superb New SEEDLING THUNBERGIAS, which he has named Alata superba and Aurantiaca superba, and which he intends sending out the first week in August (free by post), at 5*s*. each, with allowance to the Trade, if three or more are taken. For description J. F. begs to refer to the following Editors' opinions:—Dr. Lindley, in last week's *Chronicle*—"J. Fryer.—If your seedling Thunbergias called Alata superba and Aurantiaca superba retain their increased size, they are certainly a great improvement." Mr. Glenny, in last week's *Gardeners' Gazette*—"Mr. Fryer's Thunbergias, Alata superba and Aurantiaca superba, are very decided improvements on the previous varieties. The roundness of the flower is remarkable, and shows what may be done by perseverance. The yellow and orange are both pure and pretty." Mr. Plant, in the "Florists' Journal" for December last, describes them as possessing the most symmetrical outline he ever saw, and forming a perfect circle—the segments of the limb overlapping to such a degree as to give the flower nearly the substance of two.

Clarendon Nursery, Camberwell, London, July 11, 1844.

THE BEST 24 VERBENAS EVER OFFERED, FOR 21*s*., OR 12 FOR 12*s*.

G. SMITH begs to offer the following splendid Verbenas, including all the choicest varieties of the season, which obtained the 1st Prize at the Royal Botanic Gardens of London, July 2; where they were much admired for their fine form and brilliant colours:—viz., Azurea grandiflora, Atro purpurea, Atro sanguinea, Beauty Supreme, Brilliant, Princess Alice, Celestina, Wonder, Queen of Whites, Moucost, White's Surprise, Youell's Surprise, Blue Queen, Zutex, Excelsa, Delicata, Array, Striata, Speciosa, Princess Royal, Hislopeana, Orange Perfection, Poolii variabilis, Modesty, Perfection, Elegance, Variegata, Ne plus Ultra, Ingramii, Renown, Stewartii, Ignescens, Sumperii, Howardii, Boule de feu. A remittance from unknown correspondents.

Tollington Nursery, Hornsey Road, Islington, near London.

CLARKE and CO. (late Henry Clarke), respectfully solicit the attention of Market-Gardeners and the Trade to the under-mentioned LIST of PRICES of SEEDS, which will be in requisition shortly, and can be recommended.

Onion, best White Lisbon	2*s*.	6*d*.	per lb.
,, Globe, or Flat Tripoli	5	0	,,
Cauliflower, fine Early	8	0	,,
Turnip, early Stone	1	0	,,
Spinach, Prickly or Winter	6	0	per bus.
Lettuce, Brown or Bath Cos—white seeded	6	0	per lb.
,, True Bath Cos—black-seeded, very hardy	8	0	,,
,, Hardy Green Cabbage	4	0	,,
,, Brown Dutch	3	0	,,
Cabbage, superfine Early Dwarf	2	6	,,
,, ,, Early York	2	6	,,
,, Nonpareil (fine)	2	6	,,
,, True London Market	2	6	,,
,, Drumhead, or Cattle	1	6	,,
Other varieties of Cabbage seed from 2*s*. 6*d*. to 3*s*. 6*d*. per lb.			
Colewort, or Collard, fine hardy green	3	0	,,

A remittance or reference required from unknown correspondents. Twelve months' credit given.

Seed Warehouse, 86, High-st. (opposite the Town-hall), Boro.'

MESSRS. J. & H. BROWN are now sending out to any part of the Kingdom, the following very desirable Plants for Bedding out, &c.—

	Per doz.		Per doz.
Anagallis, blue and red	6*s*.	0*d*	Chrysanthemums, the newest and best varieties by name	9*s*.	0*d*
Dbl. Scarlet Nasturtium	6	0	*The above Plants sent Post-free.*		
Verbenas, 12 sorts	4	0	Gloxinias, 6 varieties	9	0
Petunia Punctata	9	0	Fine blooming Plants of Achimenes, Grandiflora, Longiflora, Pedunculata, & Rosea	4	0
Scutelaria splendens	9	0	
Phlox Drummondii	4	0	
Yellow & White China, and Smith's Yellow Noisette Rose	9	0	Fine Plants of Double White, and other approved sorts of Camellias, well set for Bloom	28	0
Fuchsias, all the leading varieties, including Exoniensis, 9*s*. &	12	0	
Fine new Yellow Carnations, the pair	3	0	

Albion Nursery, Stoke Newington, London.

ORANGE and LEMON-TREES, 10*s*. each.—R. HALL begs to advise that he has just received his last importation of the above-named trees, varying from 18 inches to 4 feet in the stem, which he offers for sale at the low rate of 10*s*. each. They are in excellent condition, and full of leaf.—Oil and Italian Warehouse, 63, South Audley-st., Grosvenor-sq.

ROBERT HALL, Florist, Alkrington, near Middleton, Lancashire, begs to call the attention of Amateurs and Florists in general, to his first-rate Collection of AURICULAS and POLYANTHUSES, Catalogues of which may be had on prepaid application.—Alkrington, July 8, 1844.

MUSA CAVENDISHII and SAPIENTUM.—Fine Plants of the above varieties, at 20*s*. each, to be had from Wm. Melville, Welcombe Gardens, Stratford-on-Avon, Warwickshire.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith.*

"I write to describe the wonderful efficacy of POTTER'S LIQUID GUANO; Peas, Onions, and Asparagus have been singularly improved by it. People came to admire the appearance of the garden."—See *Chronicle*, p. 406.

*** Beware of an inefficacious imitation. See *Chronicle*, p. 405—"Humphreys's Compound."

Sold by most Chemists and Seedsmen.

Factory, 28, Upper Fore-street, Lambeth.

BENTALLS' IMPROVED PAPER FOR DRYING PLANTS.

W. and T. BENTALL, in soliciting the attention of Botanists to the above Paper, beg to submit to their notice the following, as one of the numerous Testimonials with which they have been favoured:—

"Gentlemen,—Though my trial of your new Botanical Paper has been short, I think it may safely be pronounced the best combination of the qualities required in such paper that I have hitherto met with, after trying several kinds, both British made and Foreign.

"It seems probable that your Paper will prove more serviceable to the Botanical traveller than the thick grey Paper often sent with specimens from Germany, and much esteemed by English Botanists; but having the serious defect of extreme liability to tear, which does not appear in your Paper. It certainly ought to supersede the demy Grey recommended in the Instructions issued by the Botanical Society of Edinburgh."—*H. C Watson, Esq., F.L.S., Vice-President of the Botanical Society of London.*

Professor Lindley, University College, London, & C. C. B. Babington, Esq., F.L.S., St. John's College, Cambridge, have also kindly allowed the use of their names as strongly recommending it.

May be had of the Manufacturers, Halstead, Essex; and of their agents, Mr. E. Newman, 9, Devonshire-street, Bishopsgate-street, London; and Mr. R. S. McIntosh, 12, Catharine-street, Edinburgh.

For Sizes & Prices, see *Gardeners' Chronicle*, June 8th & 15th.

LYNDON'S PATENT SPADE.—Sold by Green and Constable, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

BURBIDGE and HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.			Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Lean-to, feet.
in.	£	*s*.	*s*.	*s*. *d*.	*s*. *d*.	*s*. *d*.		
10	1	5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.								
10	2	2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2	15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3	10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5	5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8	15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained at half the usual cost, by dissolving Half a Bottle of this powder in a *quart of water*, and using a table-spoonful to a gallon in watering flower-beds. *Sold in bottles*, 1*s*. 9*d*. *each*, by Chemists and Seedsmen. Agents, Davy, Mackmurdo and Co., 100, Upper Thames-street, London.

*** "In these days of *deception*, it is due to those persons who send out a really good article, that those who benefit by it should make it known."—See Evidence of J. R. Pearson, Chilwell Nurseries, *Chronicle*, p. 390, "*Humphreys's Compound.*"

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON and CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS and SONS, LONDON;
Wm. J. MYERS and CO., LIVERPOOL;

And by their Agents,
COTESWORTH, POWELL, and PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, July 13, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of Mark Fothergill, 40, Upper Thames-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones	p. ton	£4	10*s*.	0*d*	Nitrate of Potash	,,	£1	4*s*.	6*d*
,, crushed, 5*l*. 10*s*. to		6	0	0	Oil of Vitriol, or Sulph. acid	p. lb.	0	0	1
,, calcined		7	0	0	Rape Cakes	p. ton	4	15	0
Carbonate of ammonia	p. cwt.	2	16	0	Salts, Epsom	,,	9	0	0
Guano, Peruvian, p. ton		11	0	0	,, Glauber	,,	7	0	0
,, Ichaboe	,,	9	0	0	Sulphate of Ammonia, per cwt., 16*s*. to		0	17	0
Gypsum		2	0	0					
Nitrate of Soda, p. cwt.		0	14	9					

Wm. Northcott, 13, Rood-lane, Fenchurch-street.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved modes of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Bulter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Bulter-street.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton, no charge for sacks, and delivered free of charge to any wharf, railway or waggon office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

TANNER'S VITREOUS FLUID and CLOTH, a Substitute for Glass for Horticultural Purposes.—The Vitreous Cloth proves its superiority over Glass, by producing the light most suitable to vegetation, superseding the necessity of any shading, preserving a healthy moisture on the plant, retaining its bloom to a more lengthened period, less expensive, and not requiring so much attention. The above (retaining heat) is preferable to glass for Hothouses, &c., the temperature of which is maintained with less fuel. It is equally applicable as a covering for Fruit trees, preserving them from frost, blight, and excessive heat. The Vitreous Cloth, made by machinery, is much superior to any prepared in a different manner. By the use of the Vitreous fluid, the Cloth (after lengthened service) may be renewed.

The Fluid sold in bottles 2*s.* 6*d.* and 4*s.* 6*d.* The Cloth 2*s.* 6*d.* and 3*s.* per yard. Manufactured by N. W. TANNER, Chemist, Exeter. Agents for Exeter and Vicinity, Messrs. LUCOMBE, PINCE, & Co., Exeter Nursery.

To Mr. N. W. Tanner—Sir, we have used your prepared Cloth, and have pleasure in informing you that whilst the light admitted through it is very suitable to vegetation, there has been no necessity to have recourse to any extra shading during the very clear, bright weather which we have so long experienced; this we consider an important point. Yours, &c.

(Signed) LUCOMBE, PINCE & Co., Exeter Nursery.

June 21, 1844.

*** Respectable Agents required.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Improvements and Machinery may be had on application.

YORKSHIRE AGRICULTURAL SOCIETY.

The EARL OF ZETLAND, PRESIDENT.

THE SEVENTH GREAT ANNUAL MEETING and EXHIBITION of the above SOCIETY will be held at RICHMOND, on WEDNESDAY, August 7th, 1844, when about SIX HUNDRED POUNDS will be offered in Prizes for Stock, Implements, Essays, Drain Tiles, Cheese, &c.

No articles can be admitted for Exhibition or Trial unless a Certificate of Entry be filled up according to the prescribed form, and sent by Letter, (not delivered), to the Secretary, MATTHEW M. MILBURN, of Thorpfield, Thirsk, on or before WEDNESDAY, July 24th. Lists of Prizes and Forms of Certificate may be had, free, on application by Letter, to the Secretary.

For the convenience of persons to whom it may be inconvenient to write to the Secretary, Mr. JOHN WATSON, of 1, Clarence-street, York, and H. J. TURNER, Esq., of Richmond, will also receive entries and transmit them to the Secretary, but all entries made to them must be at least One Day before the 24th July.

Members of the Society exhibit all articles Free. Non-Members pay 10*s.* for every article or lot of articles, before they obtain their Ticket of Admission to the Show Fields. Persons become Members of the Society by the payment annually, in advance, of a Subscription of 1*l.*, on application to the Secretary, who will be glad to give any information respecting the Society or its meeting.

By Order of the Council, MATTHEW M. MILBURN,
Thorpfield, Thirsk, July 1st, 1844. Secretary.

AGRICULTURAL COLLEGE, &c.

AT a GENERAL MEETING of the Subscribers and Friends of the proposed AGRICULTURAL COLLEGE, held at CIRENCESTER, the 1st of JULY, 1844, EARL BATHURST in the Chair, the following Resolutions were unanimously carried:—

First—Moved by T. H. S. SOTHERON, Esq., M.P., and seconded by EDWARD HOLLAND, Esq.—That it appearing by the Report of the Committee appointed at the last General Meeting that the establishment of an Institution for giving a scientific and practical education to young persons intended for Agricultural pursuits, will receive adequate support: Resolved, that the present Subscribers, and those who may hereafter become Subscribers, until the whole capital shall be subscribed for, constitute a company to be incorporated by Royal Charter, limiting individual responsibility, for the establishment of such an institution.

Second—Moved by JAMES CROWDY, Esq., and seconded by Dr. DAUBENEY,—That the affairs of the Company shall be carried on by a President, Vice-President, and Committee of Management, which is hereby authorised to apply for a Charter, and to arrange with Earl Bathurst the lease of the Farm; to call in Subscriptions, and to be invested with full powers to act in other respects; to consist of 18 Shareholders, five to form a quorum, and one-third of the number to go out annually, by rotation, but to be re-eligible; and that the following form the Committee:—

Earl Bathurst,	Charles Lawrence, Esq.
T. H. S. Sotheron, Esq., M.P.	Rev. Thomas Maurice
Edmund Holland, Esq.	Mr. Daniel Trinder
Sir M. H. Hicks Beach, Bart.	Mr. Edward Bowly
Raymond Cripps, Esq.	Mr. Edmund Ruck
Rev. J. M. Prower	Mr. James Kearsey
Mr. Henry Howell	Mr. Thomas Stone
Mr. Peter Matthews	Mr. Thomas C. Brown
Mr. T. Arkell	Mr. Thomas Iles.
Dr. Daubeny	

Third—Moved by the Rev. J. M. PROWER, and seconded by Mr. Kearsey,—That Earl Bathurst, Earl Ducie, T. H. S. B. E. Sotheron, Esq., and Edmund Holland, Esq., be the Trustees of the Institution.

Fourth—Moved by Mr. A. R FEWSTER, and seconded by Rev. T. MAURICE,—That the Council of the Royal Agricultural Society of England having given their sanction to the holding of a Meeting during the Session at Southampton, for the purpose of making the objects of this Institution more generally known amongst Agriculturists: Resolved, that a Meeting be held on the evening of Tuesday, the 23d instant, at Southampton, and that the Committee appoint a Deputation to call and attend such Meeting.

Fifth—Moved by Mr. EDWARD BOWLY, and seconded by Mr. CHARLES LAWRENCE,—That Earl Bathurst be President, the Earl of Ducie, Vice-President, and Mr. Robert J. Brown, Honorary Secretary, to be ex officio members of the Committee.

Sixth,—It was Resolved unanimously—That the thanks of this Meeting be given to Earl Bathurst, for taking the chair.

REPORT OF THE COMMITTEE.

The Committee report that in pursuance of the resolution in that behalf passed at the General Meeting, they have by public Advertisement and otherwise, invited Tenders of a suitable Site for the proposed College. They are happy to inform the Meeting that they have received the offer of a Farm on Lease from Earl Bathurst, which, from its general character and situation, is, in their opinion, so well adapted for the purposes of the Institution, that they have no hesitation in recommending that an application be immediately made to his Lordship for the terms on which he would be willing to let the Farm. The Committee have every reason to believe the terms would be entirely satisfactory to the Subscribers. They have great satisfaction in reporting further a very handsome offer on the part of Earl Bathurst, to advance at very moderate interest, to be added to the rent, one-half, not exceeding 2000*l.*, of the expense of the necessary buildings.

This Farm now consists of about 400 acres of arable, and 30 acres of pasture land, and is situated about one mile from Cirencester, and accessible by two good turnpike-roads.

The Committee are further enabled to report that the application for a Charter has been so favourably received by Government as to leave no doubt that one will be granted, provided the Society consent that any surplus of income, after paying dividends at the rate of 4 per cent. on the subscribed capital, shall be applied to increase the efficiency of the Institution.

The Committee continues to receive such increasing support and encouragement, that with the aid of the fund for building offered by Earl Bathurst, they are of opinion that all necessary steps for the establishment of the College may at once be safely taken. (Signed) RAYMOND CRIPPS, Chairman.

Cirencester, 1st July, 1844.

YORKSHIRE LAND-DRAINING ASSOCIATION.—At a MEETING of the PROVISIONAL COMMITTEE held at YORK, this day, for the purpose of Allotting the Shares applied for in the Association, and on other business—

It was resolved that the number of Shares now allotted being amply sufficient to justify the Committee in proceeding forthwith to carry out the objects of the Association, the necessary Deed of Settlement be prepared for execution. And that such of the Public as may yet be desirous of becoming Shareholders, and shall signify the same to the Solicitors (Messrs. BLANCHARD, RICHARDSON, and GUTCH, York), or to the Secretary, (Mr. CHARNOCK, Wakefield), on or before the 31st of July next, shall be admitted (if the number of unalloted Shares be sufficient), on the same terms as the present Subscribers.

York, June 12, 1844. JAMES HAMERTON, Chairman.

AGRICULTURAL SCHOOL.

MESSRS. NESBIT'S ACADEMY, 38, Kennington-lane, Lambeth, near London.

"From Chemistry alone further progress in Agriculture is to be expected."—LIEBIG.

In this School, in addition to the general routine studies, every facility is afforded for the acquisition of a sound knowledge of Chemistry. The Pupils are practically taught in the Laboratories the methods of analysing the various earths, soils, manures, &c.; and likewise the means of detecting the substances abstracted from the land by different crops. Land Surveying is also taught practically, as well as theoretically.

A copy of a Lecture on Agricultural Chemistry, delivered by Mr. J. C. NESBIT to the Maidstone Farmers' Club, and the Terms of the School, which vary from 40 gs. to 70 gs. per annum, may be had on application, either personally or by letter.

Mr. NESBIT'S Works on Land Surveying, Mensuration, Gauging, Arithmetic, English Parsing, Education, &c., may be had of all Booksellers.

REFERENCES.—Dr. D. B. Reid, F.R.S.E., &c., Author of "Elements of Practical Chemistry," &c., St. James's Park, Westminster; G. F. Richardson, Esq., F.G.S., Author of "Geology for Beginners," &c., British Museum, London; W. and J. Gibbs, Esqrs., Civil Engineers, Devonshire-street, Portland-place, London; Rev. T. Cuffe, Carlisle Episcopal Chapel, Lambeth; R. Greenhill, Esq., Ashford, Kent; and C. G. Whitaker, Esq., Barming, near Maidstone, Kent.

The School will be re-opened on Monday, July 15th, 1844.

ROYAL AGRICULTURAL MEETING AT SOUTHAMPTON.

THOMAS MATCHAM, of the ROYAL HOTEL, Southampton, being the sole appointed Agent for the London and South-Western Railway Company, begs to inform those parties who intend sending Cattle or Implements for the approaching Agricultural Show, that he will be in readiness at the Railway Terminus and the Portswood Station to convey Implements and Cattle to the Show-yard at very moderate charges, particulars of which may be obtained upon application at the Terminus of the London and South-Western Railway, Nine Elms and Southampton. T. MATCHAM requests—to prevent disappointment—that due notice may be given him, with full particulars of what each party may require. Omnibuses, Flys, and Post-horses will be in readiness at the Terminus to meet the Trains for the conveying of Passengers to the Show.

DRAWING-ROOM CLOCKS.—A. B. SAVORY and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days and strike the hours and half-hours. Price 4 guineas, 7 guineas and 10 guineas each, and upwards. The performance is warranted.

A Pamphlet, with detailed lists of Prices, and illustrated with sketches, may be had on application gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost." —*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

PAXTON-PLACE, NEAR ST. NEOTS.

TO BE SOLD BY AUCTION, by WM. MEDLAND, on MONDAY 22d, WEDNESDAY 24th, and FRIDAY, 26th days of JULY, 1844, by order of the Executors of the late H. P. STANDLY, Esq., 3530 GREENHOUSE, ORCHIDACEOUS, and other Hothouse PLANTS; Three Superior GREEN and HOTHOUSES, 52 MELON and CUCUMBER LIGHTS, and 265 Dozen of CHOICE WINES.

ARRANGEMENT.—On Monday 22d: 1026 Greenhouse, 938 Orchidaceous, and 574 Hothouse Plants and Cape Bulbs, at Ten o'clock. On Wednesday 24th, 1600 Greenhouse Plants and Bulbs, and the Hot and Greenhouses, and Melon and Cucumber Lights, at Ten o'clock. On Friday 26th, the Wines, comprising 102 doz. Port, 38 doz. Sherry, 80 doz. East India Madeira, 11 doz. Claret, 14½ doz. Hock, 20 doz. Champagne, and other Wines, at One o'clock.

Catalogues may be had at the George, Huntingdon and Bedford; Eagle, Cambridge; Unicorn, St. Ives; Swan, Biggleswade; Three Cups, Aldersgate-street, London; and of WM. MEDLAND, Surveyor and Appraiser, St. Neots.

TO CAPITALISTS.

TO BE SOLD, to pay a clear Five per Cent., THE TOLLS arising from the Navigation of Vessels laden with Corn, Coals, Timber, Stone, &c. &c., passing along the River Waveney, from Beccles to Bungay, Suffolk, with a Capital Residence, Malting Office, Business Premises, &c., at Bungay.

The above Property is let on Lease at 1300*l.* per annum, six years of which Lease were unexpired at Lady-day last.

For Price and further Particulars apply to Mr. BUTCHER, Auctioneer, Norwich.

VALUABLE CHURCH-PREFERMENT.

TO BE SOLD, the NEXT PRESENTATION to the RECTORY of RICKINGHALL INFERIOR, in SUFFOLK. The Incumbent is in the 68th year of his age, and the Net Income arising from the Commuted Tithes, Glebes, and Surplice Fees, average about 565*l.* per annum. Also, the NEXT PRESENTATION to the RECTORY of RICKINGHALL SUPERIOR, possessing a Net Income of 437*l.* per annum.

For further particulars apply to Mr. BUTCHER, Auctioneer Norwich.

CARNATIONS AND PICOTEES.—Grand Exhibition now in full bloom, at Messrs. N. & B. NORMAN'S, Bull Fields, Woolwich. July 6, 1844.

GRAND FLORAL FETE & HORTICULTURAL EXHIBITION, will take place in the Rosherville Gardens, Gravesend, on WEDNESDAY, July 17th, 1844, when Prizes to the extent of 50*l.* for the best productions will be distributed. Two full Military Bands will be in attendance, and the Evening's amusements will conclude with a brilliant display of Fireworks. The Gardens will be opened to the Public at 12 o'clock. Admission, 1*s.* each.

The Gardeners' Chronicle.

SATURDAY, JULY 13, 1844.

MEETING FOR THE TWO FOLLOWING WEEKS.

TUESDAY, July 23 South London Floricultural . 1 P.M.

A CORRESPONDENT has sent us the following statement concerning the JUDGES at the last ROYAL BOTANICAL SOCIETY'S Show in the Regent's Park. He complains of two things. The first is, that two or three Nurserymen were appointed to judge the Amateurs' Roses, and three Amateurs to judge the Nurserymen's in return, nearly all of whom were themselves exhibitors; so that, in fact, each party judged the other's Roses. The second allegation is, that although one Nurseryman was disqualified, in consequence of having too many stems in several of his varieties, yet another Nurseryman, exhibiting two Roses without names, and two others of the same kind with the same name, received a prize; an extra prize, on the other hand, was, he says, awarded to an Amateur who had fallen into the same error which disqualified the Nurseryman. This method of judging he complains of as unfair; and very justly, IF TRUE.

But upon making inquiry, we find that, as to the first allegation, no Nurseryman whatever was among the judges of Roses, nor were there two sets of judges for those flowers; so that the first statement is altogether a mistake, and requires no further comment. The second charge is answered by the judges thus:—There was but one Nurseryman's stand that did not, as far as the judges could discover, comply with the regulations, and that one was otherwise inferior, in their opinion, to those which received prizes. Not one of the Amateurs complied with the regulations, and therefore the judges had to decide whether they would refuse prizes to the whole of them, or, as they were all alike in error, determine their merits without reference to the regulations. They decided upon the latter course—and they did right.

Our correspondent adds that "Fair play is a jewel;" and we entirely agree with him. He too will, we trust, agree with us in thinking that, as other persons are, no doubt, under the same misapprehensions as himself, this mode of noticing his communication is more in the spirit of that good old English maxim, than the insertion of it, without comment, would have been.

THOUGH HYBRIDISING has already led to important results, they are probably nothing compared to what may be expected to come of it. We anticipate through its assistance a change in the whole face of cultivated plants, and we shall be much surprised if even a few years do not bring us acquainted with races of trees, esculents, corn, and forage plants, of at least as much importance in their way as those which have already appeared among fruits and flowers; all that is wanted is to call attention to the subject, and to point out what the principles are which the experimenter has to bear in mind.

The effect is produced by applying the pollen of one flower to the stigma of another. The pollen indicates the male parent, the stigma the female. In performing the operation it is necessary to use these precautions:—The female flower must be deprived of her stamens before they burst and disperse their pollen; and as soon as the stigma is glutinous enough to hold it fast, the pollen must be applied with care. Should this care not be taken the stigma is very likely to be inoculated with the pollen of her own or some other flower, and then the pollen which it is intended to use will not take; for it must be always borne in mind that a stigma once inoculated cannot be inoculated again. From want of these precautions, people are continually fancying they have obtained hybrids when they have only gained natural seedlings. At least half the specimens of so-called hybrids sent to us for examination, are not hybridised at all. When the Dean of Manchester, who is the greatest of all authorities in this matter, wishes to obtain a cross, he always endeavours to force the female parent before others of its kind blow, so as to be insured against accidental inoculation from pollen floating in the air. Want of attention to these minutiæ has led to some singular errors on the part of a very ingenious correspondent, who fancied he had obtained seedlings between Crinum, Ismene, Buphane, Calostemma, &c., while he had only raised the usual seedlings.

It is hard to say within what limits the operation may be successfully practised. The general rule is that plants only, which are very nearly related, are able to inoculate each other. But there may be exceptions to this. At least we know that very near connexions have, or seem to have, a great aversion for one another. For example, a Raspberry and a Strawberry are first-cousins, yet they appear to have no mind for an alliance. A Gooseberry, Currant, and Black Currant are still nearer to each other, and their repugnance seems invincible; at least nobody has yet found means to hybridise them with each other, though many have attempted it. On the other hand, Heaths, different as they are from each other, intermingle freely; Cereus speciosissimus is readily inoculated by the night-flowering Cereus; and even the creeping Cereus has been crossed with the former; the Rhododendron will fertilise the Azalea; and, strangest of all, the Red Cedar has on several occasions been found to inoculate the American Arbor Vitæ, the issue from which is that curious whipcord-branched plant called in the gardens Thuja filiformis. This singular shrub was so produced for the first time in Messrs. Loddiges' nursery at Hackney, and has since been obtained in the same manner at Paris. These facts open a very wide field for inquiry, and are especially valuable as affording evidence that the limits of hybridising are far from being narrow.

In the midst of many experiments conducted without exactness, from which no safe conclusion can be drawn, there are some which, in the hands of such men as the Dean of Manchester, seem to justify the important inference, that as a general rule the properties of the male parent will be most conspicuous in the hybrid. For example, Mr. Herbert crossed the long-yellow-cupped common Daffodil, with the small red-edge-cupped Poet's Daffodil; and the seeds of the common Daffodil furnished a bulb with most of the attributes of the Poet's Narcissus. The same gentleman also obtained out of a capsule of Rhododendron ponticum, inoculated by Azalea pontica, seedlings which had entirely the habit of the latter or male parent.

In like manner the arborescent crimson-flowered Rhododendron atlaclerense was raised from the seed of the dwarf pallid R. catawbiense hybridised by the arborescent crimson R. arboreum; and when the common scarlet Azalea, with its crimson flowers and narrow leaves, was inoculated at Highclere by Azalea pontica, Mr. Gower found that its seeds produced plants much more like the male than the female parent. Exceptions, or apparent exceptions to this, do no doubt exist, and hybrids could be found who are either half-way between their father and mother, or more like the mother than the father; but as far as any means of judging at present exist these would seem to be the exception and not the rule; and therefore the greater influence of the male may be taken as a tolerably safe guide in all experiments upon this interesting art.

IN resuming the important subject of the SCALE INSECTS infesting the Orange plantations in the Azores, and elsewhere, it may be observed that there are two others, of the same family, which affect those trees. The most formidable one is named Coccus Hesperidum, which we have frequently observed on the under side of the leaves of the Lemon and Citron, as well as of the Orange; and in greenhouses it is said these scales will attach themselves to Myrtles also, when they are kept rather warm. This animal is covered with an elliptical shield, which is inseparable from it, and of a deep brown colour, with a pale margin. It is a difficult pest to exterminate; and although many modes have been suggested, the best will not succeed, unless applied with care and perseverance. Lime and Tobacco-water may be thrown with the syringe upon the under sides of the leaves, the worst of which must be cut off, collected into baskets, and immediately burnt. This should be done at the coldest period of the year, when the young are inactive; for we have seen them running about as late as November in a greenhouse. We would also recommend a decoction to be made of shag Tobacco and water, say 1 lb. to a gallon, in which the leading shoots, when affected, should be immersed; and by repeating the experiment, it may be ascertained at what degree of strength and heat this liquor may be used, so as not to injure vegetation, and yet destroy the animals.

There is found also upon the Oranges, especially attached towards the crown and around the stalk, a smaller oval scale; it is of a brownish colour, and something like an oyster-shell when magnified, being slightly convex, with the anterior edge pale and membranous. It adheres very closely; and those which we removed left a whit spot beneath. Under one of these scales we found a fleshy Orange-coloured female, with eight or ten shining eggs, of an oval form, and a Lemon-colour. The mother was firmly fixed by her rostrum, which is more slender than the finest hair; and it was inserted into the skin of the fruit with such force, that it was with difficulty we could remove her. Beneath another scale were two or three smaller ones, which had been formed by the young under their parent; for, on removing these minute scales, which were bright brown on the disc, little females were disclosed, similar in colour to the eggs. It is not a little remarkable that these are a totally distinct species from that which inhabits the leaves; indeed, they belong to different genera. The leaf-scale, having the shield attached to the animal, is arranged under the Linnean group called Coccus; whilst that on the fruit, as we have just shown, is not attached to the scale, which forms a distinct shield; and this structure characterises the genus Aspidiotus.

It is fortunate that little need be apprehended from this scale; for no remedy but the destruction of the fruit could avail in its extirpation. But should it ever make its appearance in any numbers, it will be advisable to gather the affected fruit at once and burn it.

Those who are desirous of becoming better acquainted with the habits of these insects will find the economy, &c. of several species discussed in last year's *Gardeners' Chronicle*; but we may here state, that the males of the three species of Coccidæ infesting the Orange-trees are, we believe, unknown to naturalists. They are no doubt exceedingly minute, with two little white wings and two tails, similar to those of Coccus Aceris, figured in Curtis's Brit. Ent., pl. 717. It would be of essential service to destroy these gentlemen, in order to prevent the fertility of the females; and, since our first notice of the subject, it has occurred to us, that if the application of any of the adhesive paintings of clay, marl, &c. did not destroy the old females, which might escape the operation of scraping, from being stationed in the forks or upon young branches, still they would, if done in a workmanlike manner, prevent the young, possibly, from hatching, or at least from seeking fresh spots for subsistence; and if this end only were accomplished, the Mussel-scale must disappear the following season. We also think that the delicate males would be sealed up in their cocoons, from which they issue backwards.

Having thrown out these hints regarding the different species of scales which affect the Orange-trees, it only remains for us to observe, that as one of the most important uses of the *Gardeners' Chronicle* is to direct the attention of its readers, who have leisure and opportunities, to the most effective modes of destroying noxious insects, we trust that such as have Apple and Pear-trees affected by the Aspidiotus conchiformis will try experiments, and communicate them through this channel, by which means they may assist materially in saving the Orange-groves of the Azores.—*R.*

FRENCH CULTIVATION of the PELARGONIUM

(*Continued from page* 443.)

Propagation.—This is usually effected in two ways—by seed, and by cuttings; the last mode is practised to preserve the choice varieties, and the other to obtain new ones; for it is not to be supposed that the seed will produce plants similar to those from which it is taken: that scarcely ever happens. Cuttings are generally taken when the plants have ceased flowering, when they must be cut down to the second or third leaf above the shoot of that year. Strip off two or three leaves from the lower part, and the stipules, or little leaves, which are at the bottom of the stem; the cutting should be cut across immediately under a joint, then planted in a small pot with the soil well pressed around it, but not so as to hurt the bark. The watering-pot, if the earth be damp, will not be required, otherwise, a slight watering will be necessary: after which they must be left to dry in the open air, then placed under a frame upon a hotbed, and shaded whenever the sun shines on them. In a month or six weeks, they will have taken root, and must then be exposed to the air, by opening the top of the frame; at night they should be left entirely uncovered; and when sufficiently accustomed to the open air, they should be put into beds in an open situation, in order to make them hardy and strong. When the fibres have lined the sides of the pots like network, they require to be put into larger pots, in which they may remain until the general time for repotting. There are two other modes of taking cuttings, which succeed at least as well. A border being well dug, pulverised, and raked, lines are to be drawn at the distance of five or six inches from each other; the cuttings prepared as described are then planted in rows, and the name of each variety is painted on small wooden or lead labels. The planting finished, drive into the ground at each end a small wooden fork, and lay a stick across them, to support a mat to shade the cuttings from the sun. After ten days or a fortnight the matting should be put on later in the morning, and taken off earlier in the evening, and it should never be spread in rainy weather. In pots five or six inches in diameter, plant four or five cuttings around, an inch from the sides; water them very gently, and then range the pots under the shade of a

hedge or wall, taking care that no drops from it fall upon them; by those methods very few cuttings are lost, because though they may be exposed to much rain, the evaporation is greater in the open air than in a house, where, though the confined heat and moisture would cause them to take root quickly, those agents of vegetation would also occasion their decay. Though cuttings may be taken at all seasons, with the requisite precautions, the months of June, July, and August, are the most favourable.

Increase by Grafting.—If you wish to have two or three different varieties on the same stem, choose a plant with the same number of branches that you wish to have of colours. Cut off the tops of these branches the evening before they are grafted, as low as possible; and when the excess of sap has evaporated through the incisions, select an equal number of strong grafts (from stocks of equal vigour, so that there be an evenness and uniformity in the parts of the plant), from 9 ins. to 10 ins. in length; insert them in the incisions, bind them with soft ligatures, cover them with fresh Moss, and place them under a bell-glass shaded from the sun until the grafts have taken well.

Saving the Seed.—The seed must be gathered gradually as it arrives at maturity; for since all the flowers do not blossom at the same time, the seeds will not ripen simultaneously. You may know when to collect them by the brown colour of the upper part of the pod; the pod then becomes detached from the calyx, and if not carefully watched, may be carried away by the wind. The seeds should be put into paper bags and kept in a very dry place, until a sufficient quantity has been collected. Those which are collected at hazard may sometimes produce good varieties, but those from choice plants are far preferable. Seed may be raised so as to produce plants participating of the nature of two different stocks. Suppose two Pelargoniums in flower, of different colours, and that it is desired to have these two colours united in the same flower: to effect this combination, it is only necessary to cut out the stamens of that which you intend to become the parent, then take a small camel's-hair brush, and remove with it as much as you can of the pollen to the stigma of the mother plant, using great caution lest that organ be injured. The stamens may also be cut as fast as they ripen, and the anther applied to the pistils of the flowers that are to be fertilised. You must operate upon flowers equally advanced, or repeat two or three times this operation, in case the pistil is not fertilised the first time. In order to render the operation (which ought to be always repeated) more complete, the fertilised plant ought to be kept apart from every other, and covered with gauze, to protect it from bees and other insects, which would extract the nectar; but seed may be obtained which will give excellent varieties, without taking all this trouble, provided it be taken from flowers of first-rate merit.

ON GATHERING FRUITS.

THIS is a most important point to be attended to; for, upon the manner in which fruits are gathered depends the success of their keeping, in whatever manner they may be preserved. No fruits should be gathered when dew is upon them, or in dull, cloudy weather. On this important point every gardener agrees. I cannot too severely condemn the mode of gathering the more common fruits, as Apples and Pears, at one sweep: although a common practice, even with the best of gardeners, it is a bad one. All fruits should be gathered as they arrive at maturity, and that in the most careful manner. It, however, often happens, even in the most congenial climates and situations, that a portion of the fruit, of the same tree, and even on the same branch, will arrive at maturity sometimes before the others; the ripe portion should be gathered immediately, and carried carefully to the fruit-room, which should be cool and dry. Here they may be laid upon the shelves, or tables, as the case may be, and covered over with canvas, to prevent evaporation, and to keep the dust from settling upon them, whilst the remainder is gathered, when the whole should then be immediately packed for preservation.

There have been many plans recommended for gathering the more delicate fruits, of which I entirely disapprove. What I would recommend is to gather them by the hand in as careful a manner as possible, and lay them gently in baskets, previously padded and lined with some soft material, such as wadding, and carried without delay to the fruit-room; the shelves should be previously covered with canvas, or some such material. In good gardens, I would recommend that the fruits which are in any way difficult of being detached from the tree, should be cut of the twigs with a pair of sharp scissors, into a padded basket held beneath for their reception. This may be considered to be a tedious way of gathering fruits; I grant it is. But if we consider, we will see that the fruit thus carefully gathered will repay the trouble, by keeping longer fresh and sound. I can boldly assert, that there is more fruit injured by improper gathering and storing, than by any other means.

In proof of this, if gardeners would take an Apple or Pear which has been gathered in the usual way, and lay it aside for a day or so, then carefully peel it, they will find it bruised, though not observable before. How does this happen? I answer, that it occurred during the operation of gathering, carelessly laying them in cane baskets, and in carrying them to the fruit-room; they are also hurt in moving them from one shelf to another. It is a general practice in large gardens, to intrust the gathering of fruits to persons who are regardless how they gather them; and this is a source of much mischief, as the fruit is often much injured by them.

It was a common practice, and is in some places now, to allow the fruit when ripe to fall of its own accord; and many plans have been adopted to prevent the fruit from injury by falling on the ground. Fruits allowed to remain on the trees till sufficiently ripe to fall of their own accord are much too ripe for preserving for any length of time. Some fruits, such as Peaches, Plums, &c. will not keep over a day or two; and the flavour of the fruit thus allowed to fall will be much deteriorated. There are certain criteria by which we may know with great nicety when fruit is in a proper state for gathering. Most fruits, such as Peaches, Pears, and Plums, part freely from the tree when ripe. Plums should be handled in the most careful manner, otherwise the bloom will be rubbed off them. When this is the case, a little fine flour should be carefully dusted over them, but with the greatest delicacy. Apricots should be gathered when the side next the sun feels soft, which may be ascertained by a gentle pressure with the finger. This fruit adheres firmly to the trees, and would, if not gathered, remain until it was over-ripe, and had become mealy. Peaches, Nectarines, Apples, and Pears fall of their own accord when fully ripe; but they should never be allowed to do so, for reasons before stated. The best plan is to gather all fruits, with the exception of stone-fruit, some time previous to their arriving at maturity, to place them in a warm room to accelerate their ripening, if they are required for immediate use. A good criterion with Apples and Pears is to cut up a fruit of average ripeness, and if the seeds have acquired a brown or black colour, they are in a fit state for gathering; but if they remain white, the fruit is not ripe, and should remain some time longer on the trees, even supposing a slight frost should intervene. Some sorts of Pears and Apples which have had a slight touch of frost are not injured by it; on the contrary, they will be found to have acquired a finer flavour. If severe frost should set in before the late sorts of Apples and Pears on the walls (which in some cold and unfavourable climates will be the case) have arrived at proper maturity for gathering, they should be covered by suspending canvas or bunting in front of them. Having procured the proper materials, and cut or sewed them into convenient lengths, they should then be fastened on the top of the walls by means of hooks and eyes of sufficient strength, and to pegs driven into the ground, at 2 or 3 feet from the wall; this covering should always be taken off during the middle of the day, and replaced in the evening; by this means they can be allowed to remain on the trees much longer, free from frost. If Apples have been pitted in the manner previously recommended, and if very severe frost should occur, the pit should on no account be opened if there is the least suspicion that the frost has reached them; if it is opened air will enter, and the consequence will be the entire loss of the fruit. When the frost has disappeared the pit may be opened with safety.

Cherries.—This fruit should be gathered when quite ripe. I, however, would recommend a portion of them to be gathered before being quite ripe, and if required for immediate use, they should be suspended over a hot-house flue in a basket, in order to accelerate their ripening. The remainder may be kept in air-tight tin cases, of a broad and flat form, packed in a little fine dry charcoal, Beech-flowers, or bran, until they are required for use.

Strawberries and Raspberries.—For these fruits, as far as I am aware, there has been no means adopted for their preservation for any length of time. I would recommend that the fruit which has begun to change colour (which some will do before others) should be gathered, and placed in a hot-house to accelerate the ripening; this will afford a succession. Fruits gathered in this manner and surrounded with silk-paper, and then packed in tin cases, thoroughly air-tight, with a little charcoal sprinkled amongst them, will be found to keep for some time; the later sorts of these fruits should only be preserved. The flavour of these and other fruits of this nature, which have been preserved in this manner, will not be so fine as those that are allowed to remain on the plants and ripened by the sun. However, fruits preserved in this way will be found useful for dessert, when those in the open air are finished.

Walnuts, Chesnuts, Filberts, &c., should not be gathered until they are quite ripe, and fall of their own accord from the trees. It will often happen, however, in late seasons, that the winter will be far advanced, especially before Chesnuts drop, therefore they should be gathered by means of ladders; but on no account should the trees be beaten with sticks, which is a very common practice, but cannot be too severely condemned. After they are gathered they should be divested of their outer shells, and gently dried, after which they may be packed in boxes or casks, in fine dry sand or charcoal, in alternate layers, and placed in a dry cellar; the casks or boxes should be elevated on bricks, to prevent rats and mice from destroying them, which will be the case if they once gain admittance.

Packing for Carriage.—This is also an important point to be attended to, especially when over-ripe fruits have to be sent to any distance. In this, as in preserving and gathering, different methods have been adopted, and a great many of them without success. Baskets, for packing fruits, should on no account be used if it can be avoided. I would recommend two boxes, to be of different sizes, with false bottoms, and secured with a lock and two keys,—the one to be kept by the person who packs the fruit, and the other by the person who unpacks it. Boxes made of inch-deal have been recommended by some; these will answer the purpose equally well, if they have been made thoroughly air and water-tight. In packing fruits of all descriptions, the heaviest should always be laid in the bottom, and the more delicate on the top, each fruit being previously surrounded with clean linen or fine paper, and packed amongst bran, Beech or Hazel-flowers; fine-powdered charcoal will answer equally well, if it has been thoroughly dried previous to being used. Whatever material has been made use of for packing, when the fruit is taken out it should be properly cleaned, and laid in some cool cellar until required for use, first taking all bruised ones out and throwing them away; for, if they are left, they will impart a musty flavour to the others. For packing Grapes, I would recommend bran thoroughly dried, first putting in a layer of bran, then Grapes, shaking a little amongst the berries, which will fill up any spaces between them, and likewise prevent them from bruising each other; when unpacked, the bran will fall out from amongst them, and if any remain, it should be removed with a small painter's brush; the berries should then be treated as before directed, when they will be ready for the table.

The smaller fruits, such as Gooseberries, Currants, &c., should be packed in flat tin cases, and on no account should a large quantity be put into the case; if this is done, they will not be fit for use at their journey's end. All these small fruits should be packed in bran, which can be easily removed when they are unpacked; this will prevent them from bruising one another. When unpacked, they should then be laid in some cool apartment until they are required for use.—*John McIntosh.*

ROSE GARDEN.—No. XIV.

(*Continued from page* 444.)

Pushing Eye.—Sometimes a jet from an eye will start before the winter, and grow an inch or more; and this (if not killed by severe weather—a matter to be dreaded with a small and delicate shoot), will show a tendency to burst into leaf with the first intimation of spring. This is not desirable, as it would form one straight leader; and yet, from the little rings around it appearing so undefined, and no buds being clearly perceptible, the only chance of life appears in the summit. This, however, is not the case; and in order to delay it, and cause the sap to form buds on either side, the little shoot may be shortened to three or four rings, and left about an inch long; buds will then form on each side of its base, as well as from the rings, and instead of a single stronger leader, the tree will form a little head at once. This mode ought to be adopted also (when wood only is required) with the buds of the previous seasons' insertion, by nipping off the point of the shoot when three or four eyes have been formed; in this case the plant has not advanced enough to suffer the evil of a check, but rather a restraint, which being only just sufficient to increase the impatience of the plant to start into action, does not diminish the quantity of wood to be formed, but by multiplying the shoots, keeps it nearer home and forms a better head, yielding more buds to work from, and sooner than if left to run up, and for this reason less inclined to flower; this mode of treatment presupposes the plant to be both healthy and in good ground.

Guards against Wind.—The inserted buds, when vegetating, have, as has been before observed, no immediate junction with the stock; to prevent, therefore, their being knocked out by the wind, it is necessary to tie a small, but not flexible twig, as thick as the finger, to the stem of the tree, leaving a foot sticking out above; and when the jets are a few inches long, to tie them with a piece of bast to this guard to defend them from injury.

It sometimes happens, on looking at the buds which have taken and sprung several inches, that a want of vigour may be observed in some particular shoot, which droops as if about to die off. On examining this, it will be found that just at that place where the ripening had commenced, a slug has been at work, and eaten half-way through the shoot; whether it is that this operation is performed by the animal for the purpose of destroying the end, and eating it when dead, or merely to devour that small portion to which it has applied itself, does not appear, though, from the habits of the animal, the former is not improbable. However this be, slugs seldom sever the shoot the first time they attack it, but always return and finish what they have once begun. If the shoot were left to itself, the slug, or the next gust of wind, would destroy it. To avoid this, a small stick may be laid alongside the shoot, and both bound round and round gently with bast (covering the shoot close) to the top, the leaves only being left out, thus rendering it impervious to the attack of the animal, for at least two or three inches. A dead cabbage or other leaf may be placed at the bottom of the tree, and, in all probability, the enemy will be found under it in the morning; while by the precaution taken, the shoot will be protected from further injury, unless a fresh attack be commenced beyond the ligature.

Home Correspondence.

The Chiswick Exhibition and the Judges.—A communication in the last Number of the *Chronicle*, signed "One of the Judges (not of Heaths)," demands more notice than has been bestowed upon it. Although your correspondent, in his evident ignorance of the rules for the guidance of the judges, which year after year have been published by the Society, and also in the *animus* which pervades his communication, appears more in the character of a disappointed exhibitor, than of "One of the Judges," I will suppose him to be what he terms himself; and, granting this, I would ask, Whether the instance he so pointedly alludes to, and so strongly condemns, is the only one that ever came under his notice

during his extensive judicial experience? If not, from what motive has this particular case been selected from all others as the groundwork of his animadversions? It surely cannot be possible that a judge who professes so much liberality, would thus wantonly accuse his fellows of "exceeding their duty, overstrained discretion," &c., at the instigation of any disappointed exhibitor. For the sake of his consistency, I hope that this very just judge was not one of the fruit censors, because they acted on precisely the same principle that governed me and my colleagues; they withheld the principal prize from the Grapes exhibited by market-gardeners, because in their opinion the Grapes did not deserve the principal prize; they likewise gave a Silver Banksian Medal only to the second best Grapes in the same class, thus lowering the best production one degree, and the second best production three degrees in the scale of prizes. Of course your very censorious correspondent could not have been aware of this, or he would not have blamed us exclusively for merely doing the same. The matter has been brought so prominently forward, that I feel bound, in justice to myself and colleagues, to state the grounds upon which our decision was formed. There were two collections of six Heaths exhibited, one belonging to a nurseryman and the other to a private gentleman; consequently, as they stood in different classes, and did not compete one against the other, each would have been entitled to a Silver Gilt Medal had the plants been good enough to deserve it. The judges, however, considered that they were not, because, although there were some very good plants in both collections, they were not all good; and it was our opinion, and still is mine, that there ought to be six good Heaths shown to deserve a reward of 4*l*. In the nurseryman's collection all the plants were in good health, but two, if not three of them were much too young and small to justify their admission into a collection of six. The best grown plant, because the most difficult to grow well, in the other collection, was splendens; the other five (if I remember correctly, but certainly four) were critically compared with plants of the same kinds which formed part of a collection of twenty in the same tent, and in every instance to the disadvantage of those belonging to the smaller collection; we considered, in fact, that three separate collections of six plants might have been selected from the aforesaid collections of twenty, good enough to beat the two small collections now in question. Our decision, therefore, was not governed by "ideal notions of perfection," but by critical examination and careful comparison; and however loudly interested or inconsiderate persons may clamour against it, I feel confident that no conscientious man, who is in the habit of seeing good Heaths, would have decided differently. The office of censor at horticultural Exhibitions is by no means an enviable one, for, however anxious a man may be to do right, there are always some who, from interest, ignorance, or pique, are ready to repudiate his judgment, or impugn his equity. In the present case there must have been a stronger motive than ordinary to induce a person, who acknowledges that he has himself been persecuted by similar complaints, to come forward voluntarily and make a charge which I have shown to be wholly unfounded. Before leaving this subject, I wish to add my testimony to one part of the statement you made in reply to "One of the Judges." I have myself been a judge at the Society's Exhibitions for several years, and in no one instance have I ever known an officer of the Society attempt to lower the prizes which the judges had awarded; the whole responsibility of the awards consequently rests upon that body, and I, as one of them, am ready at all times to take my share of it; you are therefore at liberty to append my name to this communication if you think proper.—*One of the Judges of Heaths.*

What is a Flamed Tulip?—I am induced to ask this question in consequence of what occurred at the York Tulip Meeting. In the York Tulip schedule flamed varieties were mentioned, and sums of money attached to them as prizes, and being a judge upon that occasion, I very naturally refused to judge as flamed flowers those which the committee had selected as such, in consequence of their not having had a beam up the centre. An umpire was called in to decide the dispute, and the decision was given against me for this reason, viz.—because the flowers had the mother or breeder colour in them. In answer to what is a flamed Tulip? I will quote the opinion of Mr. Groom, given in the "Florist's Journal" for July, 1840. In page 57, line 15th from the top, after describing a feathered Tulip, he proceeds thus:—"Next to this comes the flamed flower, which should have, besides the feather, a rich beam up the rib of each of the petals, branching off on either side, and the points meeting the feather; at the same time preserving a sufficiency of the ground-colour between the flaming, to display it to the greatest advantage." In this description of a flamed Tulip I perfectly agree: for what constitutes a flamed Tulip except the beam?—and the cause of the beam is this:—The Tulip in breaking from the breeder leaves a portion of the mother or breeder colour which runs up the centre of the petal, and then strikes off with the real colour to the feathering; but why this is so is a mystery which we cannot unravel. It is so, however, and we can only surmise. To say it is an imperfect break would not do, as the majority of the finest Tulips are what are termed flamed ones; and if on that account they are disqualified, there will only remain a few of what are termed first-rate varieties. What is Salvator Rosa?—a flamed variety. Would you disqualify one of the finest Tulips in cultivation on account of the beam, or the mother colour, whichever you may be pleased to term it? What are Pandora, Thalia, Reine de Sheba *alias* Mentor, Ponceau très blanc *alias* Madame Catalina, Aglaia, Bijou des Amateurs, Bacchus, Cerise à belle Forme, Donzelli, Marcellus, Iago, Holmes's King, Polyphemus, Camarine, &c.? Further—What says the Editor of the "Florist's and Amateur's Annual?" In his properties of the Tulip he divides them into six parts, and in his 6th section of the properties, he comes to the marking, and he thus writes:—"The marking of the petals regular and uniform, whether it be a broad or narrow feather round the edges of the petals which are exposed, or a flame up the centre, and branching off, and though very rarely uniform in this respect, the nearer approach the better. So much in regard to the properties for showing." But the writer must have forgot this published opinion, when so lately as the 29th of June he says—"No flower can be good for show if it has the breeder colour in it;" and on the 6th July he says—"A Tulip should not have any of the breeder colour in it." I can only account for this on the following grounds, namely:—The question has not been fairly stated to him. If it was a feathered variety, and had breeder colour in it, I agree with him that it ought to disqualify a pan, providing the other pan or pans have not the same glaring fault. There has never been but one instance, I believe, of the beam and feathering being of the same colour; but I must admit that the nearer the approach to the colour of the feathering so much the better. A Tulip in the north, if the beam is very pale, is not considered of so much value as one very dark. Aglaia, although a pretty variety, is very defective in the beam. In some instances it is uncommonly pale, and at other times the colour is tolerable. The same may be said of many others. If the taste of the York florists is correct, then it will be a mere mockery to offer prizes for flamed Tulips, if those only which are what are termed, and correctly so, neither feathered nor flamed, are to be classed as such. I have a work before me upwards of 100 years old, written by the celebrated Dutch florist Nicholas Van Kampen, and the properties he lays down are in accordance with what has been previously expressed. The authorities quoted, however, are sufficient to satisfy any Tulip-grower, they being, as they are, the opinions of the best florists in the country; and I trust that the properties already alluded to will for the future form the standard of a flamed Tulip, being persuaded that they are strictly in accordance with the opinions of all England, excepting within a circuit of about 30 or 40 miles round York. I must, in justice to Leeds, Wakefield, Halifax, and their neighbourhood, say that their opinion is in accordance with the general one, and all flamed flowers are judged according to Mr. Groom's standard.—*John Slater, Cheetham Hill, near Manchester.*

Raspberries.—In the "Theory of Horticulture," the practice of training trees upon a horizontal plane is condemned, and reasons for objecting to the plan are given. It is there stated that "such a mode of training exposes a tree as much as possible to the effect of radiation." A proof of this has occurred with me this season. A part of my Raspberry plants is tied to upright stakes, another portion is arched. We had a severe frost here on the morning of the 20th of May, which did considerable injury, and Raspberries came in for a share of the suffering. Those plants, however, that are trained in an upright manner, appear to have suffered less than those that are arched. They are growing in the same soil and situation; on some of the arched plants scarcely any fruit have set, and I can give no other reason for the failure than that they have had a greater surface exposed to the frost than the others.—*Peter Mackenzie.*

Plantations.—Much has been said and written on this subject; and whilst the advocates of the several methods recommended for the improvements of our plantations have occasionally differed, so far as to afford room for controversy, it may nevertheless be said, that such difference was not so much in principle, as in degree; consequently the discussions which from time to time have arisen, do not so much refer to the merits or demerits of any particular system, as to the extent to which an acknowledged system ought to be carried. Of the advantages resulting from the operations of pruning and thinning, no one in the smallest degree acquainted with the management of young plantations entertains a doubt; but as to the time and manner in which their operations ought to be performed, and the extent to which they ought to be prosecuted, there are still many waverers; and if those who, through the medium of the Press, have favoured us with their views and notions on these important points, differed in degree, so also have their followers; and it may be said that the hand of the wood-forester of the present day, so far as regards pruning and thinning, is heavy or light, just in proportion to the extent of his faith in the efficacy of the same. The writer has been led into these remarks from what occurred to him on a late visit to the woods at Nerquis, in Flintshire, belonging to Dr. Thackeray, of Chester, (a gentleman favourably known as a planter of forest-trees.) The plantations here alluded to extend to about 450 acres. They were planted by Dr. Thackeray, in 1814, and have been pruned every year, and throughout the whole year round from that period to the present time, (some of the trees several times in one year,) the effect of which has been, that whilst there is perhaps not another plantation in the kingdom of similar extent, where the proper system of early pruning and thinning has been prosecuted with the same degree of nicety, there is not to be met with, in any other part of the country, a plantation more uniformly thriving, or that bids fairer to become in time a source of wealth to the proprietor, an ornament to the country, and a luxury to all who possess any taste for magnificent forest-trees. In these plantations there is no exemption from the pruning process,—every tree in the wood having been reared under the influence of the knife and chisel. The Oak, the Ash, and Elm, together with the Larch, the Scotch Fir, the Spruce, and other varieties of the Pine tribe, are made to share the same fate; and in every case the success has been complete. There are many who maintain that pruning of a kind so rigorous as that here instanced, is calculated to weaken and produce sickness in the stem; and there are others who, while they approve of, and extensively practise pruning of all descriptions of hard-wood, object to the process being extended to Larch and Fir, on the ground that if it would not be detrimental, it would at least be an unnecessary expense. Without meeting these objections by a train of arguments, which might be satisfactorily done, suffice it to say, that the evidences of results prove the contrary; and were those who still adhere to the objections noticed, only to visit the plantations forming the subject of these remarks, there would be no resisting the evidence which they furnish; there they would not merely have an opportunity of witnessing the beneficial effects resulting from a complete system of training, but they would also have an opportunity of witnessing the injurious effects resulting from an opposite course of management; for in the plantations, not only in that, but in the adjoining counties—particularly in Delamere Forest, belonging to the Crown, planted at the same time, and possessing greater natural advantages—the system of "Let nature work," appears to have met with but small interruption. In the one case we have clean vigorous stems, standing at proper distances, and uniformly handsome; whereas in the other we have only a thicket of dwarfish bushes grown wild from neglect, and having more the appearance of puny shrubs than forest trees; and, but for abundant evidence to the contrary, the failure in this would, no doubt, as in similar cases, be attributed to an unfavourable climate, sterility of soil, or some such cause; in short, to everything but the real cause—neglect of culture. In highly favoured situations trees will push up almost in defiance of neglect: it is not so, however, in regard to all situations; and those who would successfully grow timber on poor mountain-land, must have recourse to the arts devised by human skill, otherwise it would be in vain to hope for favourable results. As a further proof of the good effects of early and regular pruning, there are some trees growing at Craiglelo, near Ruthin, in Denbighshire, planted also by Dr. Thackeray, about 38 years ago, for W. Jones, Esq.; several of these contain upwards of 35 cubic feet of timber, and they were regularly pruned for 14 years after they were planted. The situation of the plantations noticed above is not by any means favourable; that at Nerquis stands at least 800 feet above the level of the sea, has a northern exposure, and is as poor mountain-land as is almost anywhere to be met with. It was purchased by Dr. Thackeray expressly for the purpose of planting, for a mere trifle; yet, although planted only in 1814, many of the Larches contain from 8 to 9 cubic feet of timber, and there are Oak saplings that measure from 25 to 30 feet in length, and that girt from 30 to 32 inches at two feet from the ground; from these, and other similar instances, we may conclude that very great improvements might be effected in planting, by adopting a system of treatment of the kind practised, in the cases to which I have directed attention. In most parts of North Britain the art of pruning, accompanied with proper thinning, is well understood and generally practised; but there are other parts of the kingdom, equally adapted for planting, of which so much cannot be said; indeed, in the principality generally the woods are neglected, and there is reason to fear that the great indifference on this subject so prevalent in that part of the country is neither more nor less than the offspring of ignorance.—*A Scotchman, Wales.*

Thrips.—These are more easily destroyed in Cucumber and Melon-frames than in a greenhouse or a conservatory. Let a common Cucumber-frame, say a two-light box, be provided with 12 or 16 common garden flower-pot pans large enough to hold a quart or three pints of water; fill them and place them between the plants, or wherever it is convenient; procure as many pieces of fresh unslacked lime as you have pans, and pour on each piece a few drops of spirit of hartshorn; then place the lime in the pans of water, taking care to keep the part on which the hartshorn was dropped a little above the surface of the water; afterwards, shut down the lights close, and let them remain so for two hours. If the sun shines so much the better, provided you have not too strong a bottom-heat. By this means a gas is generated which is destructive to animal life, and at the same time beneficial to plants. In the case of Cucumber-frames, the pans of water may remain until the water evaporates, and the Cucumbers will even be all the better if the pans are again filled up.—*W. P., Shirley Nursery.*

Potatoes.—Pulling off the blossom has, to my knowledge, been practised most beneficially for more than 20 years. It stands to reason that, if the plants exhaust themselves in forming seed-pods, the produce of the roots must be diminished. Let any sceptic select four rows of Potato-plants, planted at the same time and of the same sort, and from rows 1 and 3 pluck off every blossom as it appears, and upon the plants in rows 2 and 4 permit every blossom to come to maturity, and when the roots are ripe let him weigh the produce of the rows 1 and 3 against the produce of the rows 2 and 4, and communicate the result honestly to the *Chronicle*; and I shall be surprised if he persists in permitting his Potatoes to expand their bloom.—*A West Countryman.*

Ash-leaved Kidney Potato.—The origin of this Potato is imperfectly known; it was raised from seed of the Mouse Kidney near 40 years since, at Retford, in Nottinghamshire, by John Holberry, a shoemaker of that town. I seeded it in 1826, and raised several varieties of Kidney from it, but none of them was so good as the original.—*F. X. O.*

Whitney's Composition.—Mr. Whitney, I see, upholds his statement that a quart will coat twice 75 square feet. I can only say I applied his liquid with my own hand; and so carefully, that the process of scraping "next day with a card" was superfluous—there was nothing to scrape. I used it too, as hot as, without a varnisher's stoved-room, could be done. I had the greatest difficulty in eking out a second coating for 60 feet and a few inches of the glazed calico. It is still quite possible that, working in a large way, with large brushes, a large quantity of the liquid retaining naturally its heat a longer time, and with an apartment regulated for the especial purpose, Mr. Whitney may effect what he says. So respectable a man, as I believe him to be, cannot have intended to deceive the public; but I am strongly of opinion, nevertheless, that his statement will disappoint them as to the above point.—*W.*——Another correspondent writes thus:—I have tried Whitney's Composition for a covering for a turf-pit. The material used was calico at 4*d.* per yard. I find it answer the purpose admirably; but it comes greatly deficient in covering the extent of cloth specified in the printed directions. The pit I had made for the purpose of protecting half-hardy plants; after they were turned into the beds, I introduced Heaths and various other plants, all of which thrive under it; while those exposed to the action of the scorching rays of this uncongenial season are of a sickly hue. I do not consider bookmuslin a suitable article for the purpose; I think the stronger the calico is, the better. One of my workmen unluckily put his foot through one of the lights; in that case the glazier could be of no service to us; we had recourse to needle and thread.—*James Melville, Gardener, Marston Rectory.* [We have an endless tissue of complaints of the same kind, and our own experience confirms our correspondents' statements. It is, therefore, not worth dwelling further on the subject.]

Peas.—With regard to the Early Kent Pea, in addition to what an "Arbroath Gardener" says, I would state that I sowed it and the Early Warwick on the 6th of February, on the same border, and under exactly the same circumstances. I could have gathered the Kents on the last day in May, but there being a Horticultural Exhibition in this neighbourhood on the 5th of June, they were reserved for that occasion, when although there were seven exhibitors of Peas, my Early Kents won the first prize; they were about 11 or 12 days before the Warwicks.—*J. M., Cheshire.*

Foreign Correspondence.

Société Royale D'Horticulture de Paris.—This Society has again shown its incapacity of getting up anything like a fine floral Exhibition, although it can and has during the past week drawn together 2000 or 3000 plants (such as are daily seen in the markets) which may delight or amuse the idlers of Paris; but to suppose that any possible benefit can accrue to Horticulture as these Shows are now conducted, is a complete mockery; preposterous regulations will most assuredly render abortive the patronage, influence, and money lavished upon this Society. What would be thought in England of a management which required conformity to rules like these?—"1st. All plants to be in the room before 12 o'clock on Monday, and placed in lots upon the ground ready for the inspection of the judges. 2nd. The judges will examine the lots and award prizes on Tuesday, between 10 and 4 o'clock, after which exhibitors must remove their plants from the ground and arrange them upon stages. 3d. The public will be admitted from 10 to 6 on Wednesday, Thursday, Friday, Saturday, and Sunday, during which time each exhibitor must pay attention to his own plants." Would it have a single exhibitor? I think not, let the prizes be ever so tempting; yet such is the system adopted here. Is it, then, marvellous that France, with all its advantages of locality and climate, should be fifty years behind England, Belgium, or Germany, either in new plants or successful culture. Great exertions had been made to render this *fête* attractive, for, independent of the prizes offered by the Society, were four Gold Medals, one from the Duchesse d'Orleans for the best collection of plants; another from the Princesse Adelaide for a new rose; a third from some lady patronesses for the finest plants in flower; and a fourth for the finest forced fruits; beside two large Silver Medals from the city of Paris and the Luxembourg for fruit and vegetables; but even here the same mismanagement was apparent, for these prizes were only publicly made known a few days before the Show. They certainly do these things better in England. The weather was splendid during the whole week, but too hot for the Roses, which cut but a very sorry figure even by Wednesday, when the public was admitted. The company was not so numerous as usual; perhaps the superior attractions of the Champs Elysées might have caused this; nevertheless, several thousand persons visited the Orangerie of the Luxembourg, which was free to all the world. As to fine specimen plants, scarcely one was to be found. Messrs. Cels, as usual, sent a large collection of Cacti and miscellaneous plants, among which was a good Cattleya Mossiæ, Oncidium papilio, Mamillaria dolichocentra, sericata, and Melocactus cephalonophus; but the very small number of plants in flower was a great detraction from its beauty. The Gold Medal of the Duchesse d'Orleans was awarded to it. M. Morel showed Brassia macrostachya, Lælia cinnabarina, Gongora maculata, and Oncidium pulvinatum. M. L'Homme gained the Society's first prize for hothouse plants, among which were Latania sinensis, Columnea Lindenii, Anthurium Hookeri, Hoteia japonica, Candollea cuneiformis, Sabal Adansoni, Adiantum tenerum, Cheilanthes lendigera, together with a pretty collection of indigenous Orchises. The Roses in pots were very poor after those I have just seen exhibited by Messrs. Lane and Beck in England. The varieties were good, but the plants badly grown: in the same collection might be seen standards 5 feet high, and others 12 inches, which showed a miserable want of taste. The collection of M. Margottin gained the first prize—some flowers of Comte de Paris, Triomphe de Luxembourg, Smithii Gigantesque, Bougere, Maugais, Suchet, Reine des Iles Bourbon, Aubernon, and La Reine, were very large. M. René was second, and also showed good flowers of Gombault, Lady Warrender, Eliza Sauvage, Lamarque, Devoniensis, Comte de Paris, Paul Joseph, and Madlle. Hardy; but the weather was evidently too hot to see them to advantage. Seedling Roses (cut) were numerous, and the Gold Medal from the Princesse Adelaide was gained by M. Hardy for a large flower very much like the old yellow China, which was named Madame Adelaide; he had also another pretty seedling, named Princesse de Joinville, in the shape and way of Aimé Vibert, with a sulphur tint. In his general collection were some fine blooms of Belle Portugaise, a bright-red hybrid, Dupuy, black, Bougere, and Vandael. M. Laffay gained the Society's seedling Rose prize; he had several hybrid perpetuals,—the Comtesse du Chatel is good but not equal to La Reine, which he sent out last autumn. M. Verdier had a collection of Cut Roses, to which was awarded the Society's Medal; it numbered nearly 500 varieties of Provins, Hybrids, Perpetuelles, Tea, Bourbons, &c. The Geraniums were numerous—certainly not less than one thousand plants were exhibited; but as quantity seemed to be thought more of by the judges than quality, I need only say that the greater part were such as are sold in the markets at 10 sous each. MM. Chauvière and Souchet had, however, prizes for them. Fuchsias were not numerous. M. Lemou was awarded a prize for some pretty Iris Germanica, and M. Dufay for grafted Dahlias, which form nice dwarf bushy plants in pots, and flower early. M. Bachoux gained the first prize for a general collection of hot and greenhouse plants, among which were the curious Ceropegia stapeliæformis and Mesembryanthemum obconellum, and a good Mammillaria nivea. M. Ryfthogel was awarded the prize for new plants, hardly one of which was in bloom. Billbergia acaulis zebrina was in this and other collections. M. Modeste was as usual without a rival in Chinese Pæonies, and showed fine blooms of Triumphans, Reine Hortense, Victoire Modeste, Comte de Paris, and Perfection. M. Malingre was awarded the seedling prize for a collection of Alstrœmerias, which, however, seemed very like some cultivated by Mr. Gaines ten years since. The grand attraction was the fruit exhibited by M. Bergmann, gardener to Baron Rothschild, to whom was awarded the Lady Patronesses' Gold Medal, for six Providence and Moscow Queen's Pines, which were magnificent; in fact, such as either Mr. Spencer or Mr. Barnes might have been proud of showing. M. Grison had also a Gold Medal for a basket of Fruit—Peaches, Apricots, Grapes, Figs, Plums, Cherries, and Currants; and also the Silver Medal for some fine Cauliflowers Artichokes, and other vegetables. M. Paquet showed 120 Apples—Calville Blanche, Canada Pippin, Reinette franche, and St. Germain Pears, preserved after a new method, which looked as plump and fresh as they usually do at Christmas; for these a Silver Medal was also given. M. Duluc gained the Luxembourg Silver Medal for Melons, Cauliflowers, and Cabbages, which, however, were not equal to those of M. Grison.

Societies.

BOTANICAL SOCIETY OF LONDON.

June 7.—J. REYNOLDS, Esq., Treasurer, in the chair. Specimens of Œnanthe peucedanifolia and Œnanthe pimpinelloides were exhibited, accompanied by notices of their distinctive characters and habitats, by E. Lees, Esq. Much uncertainty and confusion having prevailed among British authors and distributors in regard to the distinctions between these species, the views of Mr. L., founded on good opportunities for observation, are deserving of particular attention. The following condensed abstract will explain the conclusions formed by this botanist. 1st. Œ. peucedanifolia always grows in wet places, and is found both by salt and fresh water, while Œ. pimpinelloides is found in dry ground only. 2d. The characters derived from the form of the radical leaves, and the presence or absence of an involucrum, will not prove sufficient to prevent confusion, but the rounded tubercles upon the roots of Œ. pimpinelloides will readily distinguish that species from Œ. peucedanifolia, in which the tubercles are elongate and sessile. 3d. There is some difference in the fruit of the two species, though the materials in the possession of Mr. L. are not sufficient to state this with precision and certainty. Mr. L. thus attaches the first importance to the form of the root, as a distinctive character; and this circumstance should instruct collectors to be mindful of the value of the root. Specimens collected by Mr. L. afforded the principal reason for retaining Œ. pimpinelloides as a British species, in the London Catalogue, in preference to the adoption of Mr. Babington's change to Œ. Lachenalii; and one of the same specimens communicated to Mr. Ball induced that excellent botanist to admit Œ. pimpinelloides, as well as Œ. Lachenalii, among the indigenous species. Three species, not two only, should therefore now be looked for, and the confusion and uncertainty may thus be removed. Most of the specimens hitherto sent to the Society have proved quite useless, through the absence of roots and fruit; but it is earnestly requested by the Council that contributors will collect specimens with roots and fruit, from as many localities as possible. Some highly-interesting examples of the Irish Saxifrages, belonging to Haworth's genus Robertsonia were exhibited from Mr. Andrews, who had obligingly sent living plants as well as dried specimens. Two of the specimens were sent in record of the fact, lately doubted or denied by the accurate Mr. C. C. Babington, that the Pyrenean forms of S. umbrosa, and S. Geum (with crenate leaves), are certainly native in Ireland; the specimen of S. Geum, indeed, being considered "even more obtusely crenate than Mr. Babington's figure (No. 8), from the Pyrenean plant." These specimens were collected "this year, from the mountains to the south of Brandon mountain, county of Kerry." S. hirsuta is considered by Mr. Andrews to be a hybrid form between S. Geum and S. umbrosa, "as many of the varieties present characters leaning either more or less to the one species or the other." S. elegans is deemed by Mr. A. to be simply a variety of S. umbrosa; and after a careful examination of the forms of S. hypnoides, he is now "satisfied that S. affinis, incurvifolia, hirta and palmata, are all mere varieties, or indeed, barely deserving the name of varieties." Read, "A Synoptical View of the British Fruticose Rubi, arranged in Groups, with explanatory Remarks," (Part 3,) by Edwin Lees, Esq., F.L.S. The paper was accompanied by drawings and specimens.

ENTOMOLOGICAL SOCIETY.

July 1.—GEORGE NEWPORT, Esq., in the Chair. Mr. Marshall stated that he had taken home the specimens of Coccus upon the Lime, produced at the last meeting by Mr. Thrupps, and found that they had produced hymenopterous insects. — Mr. Westwood stated that some of the Ichneumonidæ deposited their ova in the Cocci, and this was undoubtedly the case in the present instance. A want of attention to the habits of the Ichneumonidæ had led to the supposition that the male of the Coccus was a winged insect.—A collection of small Crustacea from New Zealand and Swan River, was presented by the Rev. F. Hope.—The committee appointed at the last meeting to inquire into the subject of the Coccus attacking the Orange groves of the Azores, had sent in their report to the Orange Company. They had not been able to propose any remedy which offered a prospect of immediately exterminating the pest. —Specimens of the Sarcophaga fuscata, which had been attacked by the Cælioxys conica, were exhibited by the President.—Captain Parry exhibited a box of insects from New Zealand, which contained, amongst other things, a remarkable species of wingless Grasshoppers, a species of Boletophagus, and a specimen of Sirex gigas. —Mr. Youell exhibited specimens of the leaves of a Lime-tree, covered with little conical projections, produced by the deposition of the ova of a species of Aphis.—The Rev. F. Hope exhibited specimens of Goliathus Savagesii and G. Polyphemus.—Mr. Westwood exhibited also a drawing of the G. maximus, in the possession of Mr. Turner, of Manchester, which he believed was only a variety of G. Drurii.—Several drawings of insects were exhibited from Robert Templeton, Esq., of Ceylon, and a letter was read, in which that gentleman announced that he was rapidly proceeding with his work on the Zoology of Ceylon. He referred to the bites of Scorpions, and the Scolopendra generally, and expressed his conviction that they were not poisonous. This gave rise to some discussion, in which the President stated that these insects possessed a special glandular apparatus for secreting poison; and Mr. Hope and other Members related instances of inflammatory action following their bites.—The Rev. F. Hope read a paper on some species of Buprestidæ, from Australia. The paper contained a description of 37 species, but he possessed still many undescribed. He also exhibited drawings of fossil insects identical with living species, found in the tertiary deposits of Aix, in France. He had also received others from Senegallia, in Italy.—Mr. Westwood stated that in May he had seen a swarm of female wasps feeding on some leaves affected with honey-dew. They might have been easily destroyed, and with them their coming progeny. A discussion took place as to the advantage of killing wasps, as it was well known that they destroyed many species of flies which were equally destructive with themselves.—Mr. Westwood read a paper on some new hemipterous insects. One of these he called the Plaiaria Madagascariensis, as he had first seen a specimen from Madagascar in the Museum of the Jardin des Plantes at Paris; but he had since received a specimen from South Australia.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

THE midsummer meeting of this Society was held in their garden at Inverleith, near Edinburgh, on the 28th ult. The grounds were in the highest state of beauty, and the company numerous. For the four finest specimens of Cape Heaths, the silver medal was voted to Mr. J. Reid, gr. to Professor Syme; the kinds being Erica Savileana major, ventricosa prægnans, tricolor speciosa, and Woodhall ventricosa; 2, Mr. G. Binnie, gr. to Professor Dunbar, for E. splendens, ventricosa, prægnans, ventricosa stellata, and ventricosa tricolor; 3, Mr. G. Stirling, gr. to Lord Melville, for E. ventri-

cosa nana, tricolor, Savageana major, and perspicua.—For the three finest and recently introduced varieties of Fuchsia, there were eight competitors. The silver medal was assigned to Mr. J. Downie, gr. to General Robertson, who produced F. Rogersiana, Eppsii, and magnifica, (besides several very large varieties sent for exhibition only): 2, Mr. R. Oswald, gr. at the Orphan Hospital, for varieties named Prince of Waterloo, Magnificent, and Fairy Queen; 3, Mr. J. Young, gr. to T. Oliver, Esq. for F. excelsa, racemiflora, and pulchella.—The show of Roses was on this occasion magnificent. For a general collection, consisting of sixty named sorts, the silver medal was voted to Messrs. Handasyde, nurserymen, Fisher-row. For the best twelve hybrid varieties of the China Rose, the silver medal was awarded to Mr. P. Thomson, gr. to J. J. H. Vere, Esq., for R. odorata, Devoniensis, tea-scented, Blairii, Camelliæflora, white China, Princess Augusta, Sir Walter Scott, Yellow China, Swan-neck, Crimson China, and Doctor Billiard; 2, Mr. A. Forrester, gr. to Capt. Falconar, for R. Blairii, Belzance, Beranger, Blanche, Mrs. Boyle, Indica major, Fabvier, Girling, Paroquet, Devoniensis, Maria Stuart, and Magna rosea.—Comparatively few tender shrubby Exotics were sent for competition; but for one collection, consisting of Epacris grandiflora, Elichrysum proliferum, Erythrina laurifolia, and Leschenaultia biloba, a premium was awarded to Mr. Young. For an admirably grown specimen of Pimelea decussata rosea, another premium was voted to Mr. P. Crocket, gr. to Col. Ferguson.—Many beautiful tender shrubby exotics, for exhibition only, were sent by Mrs. Haig, Professor Dunbar, J. Henderson, Esq., and Mr. J. Macnaughton.—Some very beautiful tropical Orchidaceæ were produced in full flower; a premium was awarded to Mr. Stirling, for Oncidium Harrisonii and Maxillaria Harrisonii.—Beautiful specimens of Stanhopea grandiflora, Oncidium cupreum, and Acropera Loddigesii, from View Park, were sent, not for competition.—The competition in stage Pelargoniums was limited, and the prize was gained by Mr. Young, with varieties called Duchess of Sutherland, Enchantress, Mabel, Beauty, Caroline, and Rising Sun. But the specimens sent for exhibition only were never excelled either in number or splendour, the principal exhibitors being Messrs. Dickson and Co., Leith Walk; Dickson and Sons, Inverleith; and Carstairs, Kelly, and Co., Warriston.—For remarkably well-grown herbaceous perennial plants, two premiums were voted: the first, being the silver medal, to Mr. Young, gr. to Mrs. H. N. Ferguson, for a splendid specimen of Achimenes grandiflora; and the next, to Mr. Forrester, Carlourie, for Orchis foliosa.—For producing the four most curious or uncommon native British plants, in pots, a premium was awarded to Mr. Stirling, the plants being Aceras anthropophora, Eriophorum alpinum, Asplenium viride, and Sedum dasyphyllum. To the same another premium was adjudged, for two trays, one filled with exotic, and another with indigenous alpine and rock plants, several of them of great rarity and beauty.—An extra award was made to Mr. Gow, gr. to Count Flahault, Tulliallan Castle, for a collection of Cut Flowers of more than 30 varieties of seedling Rhododendrons raised by himself. Among the remarkable plants exhibited was a magnificent specimen of Erica spuria from the Royal Botanic Garden, upwards of 8 feet high and 15 feet in circumference, the whole plant being completely clothed with rich blossoms; together with several other fine heaths of large growth.—Clerodendron Kæmpferi, in full flower, was sent by Messrs. Lawson and Sons. Echites atropurpurea, was from the Society's own collection. Nemophila discoidalis, was from the garden of the Orphan Hospital. Delphinium Menziesii, a Columbia river species, was sent by Mr. Guthrie, Dundee. A basket of the highly scented flowers of Mandevilla suaveolens was from Archerfield Garden, where the plant is grown in great perfection. Trays of very lovely Pansies were exhibited by Mr. Symington, Mr. Finlayson, Mr. Rutherfurd, and Mr. Murray. A luxuriant specimen of Heracleum giganteum, eight feet high, was sent by Dr. Neill, marked as having been grown on a very poor sandy bank, entirely without manure. Mr. Sang, of Kirkaldy, sent a dish of the ripe fruit of Rubus spectabilis, which was found not very palatable, and proved that this species is more adapted for ornament than utility.—Mr. Adamson, Balcarras, sent a Melon and a brace of Cucumbers.

BOTANICAL SOCIETY OF EDINBURGH.

June 13.—This Society met at the Royal Botanic Gardens—Professor Graham, President, in the chair. After a delightful walk through the garden and plant-houses, accompanied by the learned president, who pointed out many of the beautiful specimens which they contain, the meeting re-assembled in the class-room, when the following papers were read. 1. On four Genera of Desmidieæ, by Mr. J. Ralfs, Penzance. The genera are Cosmarium, Pediastrum, Xanthidium, and Scenedesmus, and the descriptions of them, which were accompanied by illustrative drawings, will shortly appear in the "Annals and Magazine of Natural History." 2. Continuation of Mr. James M'Nab's Journal of a Tour through part of the United States and the Canadas. In the previous part of this journal, Mr. M'Nab gave a brief outline of the principal botanical and horticultural features observed in the neighbourhood of New York. The part now read, embraced chiefly the appearance of the country around Albany, with an account of the more interesting plants seen during the journey thither. Among these, the most remarkable were several species of Lycopodium, with which the peaty soils on the road-sides around Albany were covered, consisting of complanatum, clavatum, and dendroides, the latter resembling at a distance young spruce Firs—being similarly shaped and of a lively green colour. In damp situations in the close forests, Adiantum pedatum and other ferns covered large tracts, while Pyrola elliptica and rotundifolia, with Chimaphila maculata and umbellata were in full flower along the drier parts. Satyrium herbiola, and Neottia tortilis were also observed—the latter growing chiefly in pairs. The principal plants noticed in the meadows or open grounds were Lilium Philadelphicum and Canadense, Mimulus ringens, Verbena hastata, and urticifolia with Asclepias obtusifolia and variegata. Proceeding towards Troy, on the banks of the Hudson, great quantities of Kalmia angustifolia, Cornus florida, Lupinus perennis, Andromedas, Vacciniums, &c., occurred. In an extensive forest, chiefly composed of small trees, and much entangled with Smilax or green Brier, through which the party proceeded with great difficulty, Cypripedium spectabile covered large patches, with Arum triphyllum, the latter in full flower. Mr. M'Nab concluded the present part of his journal with an account of some large trees of the hemlock spruce, Abies canadensis, being the first of this tree which the party had observed in natural situations;—the largest specimens were about 10 feet in circumference, and 80 feet in height.—The Honourable G. C. Cunningham, Mauritius, and F. S. Cordier, M.D., Paris, were elected foreign members; and A. Greenwood, Esq., Chelmsford, Essex, was elected a non-resident Fellow of the Society.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Clitoria Fulgens. Bright-flowered Clitoria. (*Twining Evergreen.*). Leguminosæ. Diadelphia Decandria.—This is an elegant addition to the number of those plants usually called creepers. It was obtained by Messrs. Veitch and Sons, of Exeter, who exhibited a specimen at the Horticultural *fête* at the Chiswick Gardens in May, as a species of Centrosema, one of the division of the genus Clitoria. It was discovered by their collector, Mr. Lobb, growing on rocks,—over which the graceful slender branches spread in all the wild luxuriance of nature,—on the Organ Mountains of Brazil, in the autumn of 1840; and seeds were received from him, at the Exeter Nursery, in the spring of 1841. These were sown immediately, and produced plants which flowered for the first time, though rather scantily, last autumn. The abundance, however, in which the blossom buds have been developed during the present spring, justify us in considering it most likely to prove a very free-blooming plant. The long, slender, and slightly hairy stems, are well adorned with handsome foliage, having a smooth and bright-green upper surface, and the lower side of a paler hue, closely covered with numerous very short soft hairs. The slightly depressed position of the leaves has a pretty appearance, especially when the stems are trained spirally round a basket, as they then fall over each other in a neat and loosely tiled manner. From the axils of the leaves, the flowers are produced in a clustered head, supported on a stiff and wiry peduncle five or six inches long, elevating them sufficiently above the foliage to display, without interruption, the bright and glowing scarlet blossoms. It has, hitherto, been cultivated in a house intermediate betwixt the stove and greenhouse, but it may probably be found to succeed pretty well in the ordinary temperature of the greenhouse. It thrives well in a mixture of peat, loam, and sand, and when removed from a small pot to a large one, its natural situation amongst rocks would point out the propriety of intermingling with this compost a few pieces of porous, broken pot, or charcoal, to keep the soil open, and facilitate drainage. And, although it will need a reasonable abundance of water during the season of growth, it will be proper to limit the supply in winter, as moisture is then liable to injure it, especially with a low temperature. Seeds have not yet been produced in this country, but it strikes root with tolerable freedom, from cuttings.—*Paxton's Magazine of Botany.*

Garden Memoranda.

Bank Farm, near Kingston, the residence of Sir John Broughton, Bart.—We visited this charming place to see the collection of Pelargoniums, which are now at the best, and were highly gratified to find some of our old favourites keeping their places, in spite of the new varieties which have annually appeared. When we looked at them we could not but wonder why, when such beautiful flowers as Matilda, Nymph, Queen of the Fairers, Erectum, &c., can be purchased at less than 5*s.* each, such inferior sorts should be cultivated as are too often to be met with, even in collections where a better taste might reasonably be expected. We were never more struck with the superiority of nature over art, than in the present instance. Plants of vigorous and robust habit, grown in moderate-sized pots, had sent up fine heads of bloom, which they supported in graceful negligence, without any help, the mingled colours contrasting finely with the clear, dark-green foliage. Not a fly or the mark of one was to be seen; upon close inspection, however, a good deal of run colour might be observed — which is the fault of the extremely hot weather—but the plants being judiciously placed upon the stage this did not materially detract from the general effect. We must leave to a future day the contents of our note-book, and will conclude by remarking that the taste and liberality of the proprietor, being well seconded by the gardener, (Mr. Redding) were manifest in everything we observed. All the plants cultivated at Bank Farm are specimens of their kind; and whether they are beneath glass, or in the beds and borders, the general effect, on the closest examination, alike proved the wisdom of doing that well which is done.

Miscellaneous.

New Horticultural Expedition.—A new voyage in search of plants is on the point of being undertaken by Mr. Lowe, jun., of the Clapton Nursery, who proceeds to the Straits of Malacca, with the intention of visiting Borneo and Java, and if possible, the coast of Siam, Celebes, and New Guinea. The spirit of enterprise which leads to so arduous an undertaking cannot fail to bring an ample reward; and we have no doubt that the name of Mr. Lowe, the younger, will soon rank among the foremost of those bold spirits to whose dangers and sacrifices the unparalleled magnificence of our gardens is chiefly owing.

New English Dye.—Dr. Robert Thomson has lately published an account of the dyeing qualities of the common yellow pale Lichen (Parmelia parietina) which he finds to contain a peculiar colouring matter, called Parietin, of a bright yellow. This is heightened by a drop of nitric, muriatic, or sulphuric acid, while minute quantities of ammonia, or other alkalies, change it to a rich red inclining to purple.

A Shelter for Young Plants.—This shelter is more especially destined to be placed near houses in places where other such contrivances would produce a disagreeable effect. It is composed of two moveable semi-cylinders, constructed in the way of straw hives. To these semi-cylinders are fixed solid feet of wood, for the purpose of being driven into the ground. If it is only necessary to shelter one plant from east or north-east winds, one semi-cylinder is sufficient; but if it is a plant which you are forced to protect, is delicate, and requires a more complete protection, you inclose it between the 2 semi-cylinders fixed one to the other by means of hooks represented in the drawing. A lid of the same construction, furnished at its edge with a circle in wood-work, is fitted, when necessary, upon the cylinder, and thus perhaps offers a more effectual shelter against the severity of cold winds and excessive heat than any other. These sorts of shades are light to move, very solid, and very warm; for, letting but little of the exterior air penetrate, they preserve very well the heat which accumulates in the interior.—*Revue Horticole.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE CONSERVATORIES, &c.

The answer given to Mr. Fryer, in the last *Chronicle*, respecting his new beautiful Thunbergias, reminds me that this is the right time to graft the varieties of Thunbergia alata, to have fine specimens of them by next April and May. The roots of T. coccinea is the best stock for them, but those of F. grandiflora will also do. Another lot grafted in September will succeed these, and a third grafting in April will keep up the succession for eight or nine months, and the trouble is not half so much as that of rearing seedlings. As the nights begin to lengthen, and the stove plants have made their growths, the house need not be kept so moist as formerly; but diminish the quantity by degrees, and do not syringe late in the afternoon.

Conservatory.—The Tacsonias sent home by Mr. Hartweg, and some of his Passion-flowers also, promise to make good Conservatory climbers. I know two sorts of new hybrid Passion flowers, one of which I have flowered—which will likewise do for this house; both are in some of the nurseries, but are not yet named. Passiflora fragrans is almost a laurel; although its flowers are amongst the sweetest, they are too sparingly produced to make a fine display. All Pelargoniums, including the common Scarlets, that are to be forced before next March, should not be stopped or cut in after this time, and all the early-struck cuttings of them should now, or soon, be planted out in beds in the reserve garden for a month or two; but as soon as they begin to get too strong or succulent pot them. Another rule to be observed with forcing Pelargoniums is that the pots should be full of roots, or what we call pot-bound, before they are brought into heat; as soon as they throw up for flowering, however, they may be shifted into larger pots, or well supplied with liquid manure. Any person can apply heat and moisture to flowers in winter; but a good deal of judgment and forethought is required to *prepare* the plants: now is the time.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Flower gardens are at last becoming a little cheerful, and the plants are rapidly making up for the time lost in the spring. Look over the beds of Scarlet Pelargoniums, and stop the leading branches wherever a flower-bud is perceptible. This will tend to keep the plants dwarf, and the flower-buds will be much increased in size by the concentration of sap. Beds of Petunias and tall-growing Verbenas are frequently much disfigured by being broken about in stormy weather. To prevent this, provide some strong pieces of Birch branches and place them in the bed, so as after they are covered, they will support the branches, and prevent their being blown about. Attend assiduously to the removal of all decaying flowers, especially on profuse flowering Verbenas, as Barcayana, Queen, &c., which will do much to prolong their season of bloom; and roll, mow, and sweep the Grass and walks at least once a week.

Reserve Garden.—Prepare a temporary pit here, either by building mud walls, or excavating the earth a few inches deep, and forming an embankment round the sides for the propagation of Scarlet and other Pelargoniums; indeed, for all free-striking plants. This pit may be covered with Whitneyed or oiled canvas, and, if there is three or four inches of light sandy soil for the earthings to strike root into it, will answer admirably.

Heartsease, Pentstemons, and most plants which make branches about the surface of the soil, may be readily increased by placing some light sandy soil about the young shoots, into which they will strike root, and may then be removed into nursery beds.

Pits and Frames.—These structures are now partly stocked with Nierembergias, &c., which are coming forward for another season. Prepare a slight hot-bed for a frame, and begin to increase such plants as you require a large stock of next season. Mangles's and other variegated Pelargoniums are generally tardy strikers if left till late in the season; therefore begin in time.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Still attend to the cleanliness of these plants, keeping them free from decayed leaves, weeds, and "the greenfly." *Polyanthuses.*—Continue to part in favourable weather; also plant out seedlings. *Tulips.*—Of these little can be said just now. The bed, however, must not be neglected; dig it over, and ridge it up, so that the soil may be sweetened by the action of sun and air. The bulbs in the boxes ought to be thoroughly dry before the loose skins or roots are removed. *Ranunculuses.*—Great attention must be directed towards the roots, as they arrive at maturity, which is indicated by the leaves becoming yellow, they should be carefully taken up, as it usually happens that some are ready to remove before others; and should the roots which have become dormant remain in the ground too long, they are apt to "start," or commence throwing out fresh fibres, which is attended with ruinous consequences. *Carnations.*—The blooming season has now fairly began, and these favourite flowers will continue to attract admiration during the present and succeeding month. In the south the Exhibitions have already commenced, and will be held, according to the locality, in different parts of England and Scotland, perhaps till the middle of September. As seedlings

bloom, pull up all single or semi-double flowers, as well as all "selfs," unless the variety has some striking characteristic, when it may be worth while to propagate it as a border flower. Commence laying the shoots, taking those varieties first which are in the greatest state of forwardness. Still tie up buds as they advance; and do not let the plants in pots lack moisture —*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Some of the Montserrats and Black Jamaicas for a winter supply should now be showing. Give these every encouragement by supplying them with liquid manure, and keeping a brisk bottom-heat, with air as the weather permits. Sprinkle the plants frequently, and keep a moist atmosphere during the time that air is admitted. If they are tardy in showing, give but little water till the fruit begins to appear. Be attentive to watering and syringing the young stock, and to the state of the linings of pits heated by dung. Much addition to them will probably not be required at this season, but it is well to be always prepared, should dull or cold weather occur.

Vineries.—In the late vineries, the Grapes which are intended to be kept till Christmas, or after (the best sorts for which are the St. Peter's, Muscat, and Tokay), should be well thinned, to prevent them from moulding in damp weather; and the shoulders of the bunches should be well tied out, to expose the berries as much as possible to the sun, that they may be firm in the skin. Repeat the washing the walls, and flues or pipes, with a mixture of quicklime and sulphur, if the red spider is troublesome.

Peach houses.—Look over the ripening fruit daily, and gather it before it loses its flavour, which it will sometimes do before it drops into the nets placed to receive it.

Fig-house.—Syringe daily where the fruit is not ripening; supply water liberally to the roots, and admit air freely.

Melons —Maintain a brisk bottom-heat by renewing the linings occasionally. In the pits heated by tanks, if constructed on a good principle, there is the advantage of being always prepared to meet any sudden rise or fall in the external temperature.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peach-trees.—Proceed with thinning shoots where they are too thick, taking off the laterals, and exposing all the wood you mean to retain for next season, to the benefit of sun and air. *Plums and Cherries.*—On old trees lay in a succession of young wood in all parts of the tree, which being kept close to the wall, will in a few years furnish finer fruit, and produce more plentifully, than can be obtained from old unsightly spurs. *Currants and Gooseberries.*—Shorten the side shoots if not already done. On plants previously shortened, the points of the leading shoots may now be taken off with advantage. *Strawberries.*—Keep the late sorts, such as the "Elton," well mulched with Grass or Straw, to keep the fruit clean. Beds that I covered early with Grass now want covering again. Look after the runners of Keen's Seedling and other early sorts. Where time and labour are not scarce commodities, it is a good plan to lay each runner in a pot, and to cut it from the parent plant when the pot is full of roots; or rich compost may be strewed between the rows to encourage the rooting of the runners. The method I generally adopt is to choose a situation with a good aspect; dig it finely; supply it with a good dressing of old Mushroom dung, or other manure; cut off the runners as soon as they have made two or three leaves, and are beginning to protrude roots; prick them out on the prepared ground three or four inches apart; shade until they begin to grow, and lift with balls either for forcing or making fresh plantations as wanted. The advantage of this system is, that you can clear away all the runners, and the superabundant plants, almost as soon as a plantation has finished bearing; thus affording free exposure to those buds which you expect to produce fruit next season. *Routine* as before.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—The directions previously given regarding summer management, are still applicable for the present time.

Coppice.—The same directions as stated above, are likewise applicable here; but the advantages in regard to profit are greater.

Young Plantations.—It is a great evil to young plantations to allow the hedges round them to grow to a great height before they are cut, by which the side branches of the outside trees are killed, or much injured, and the beauty of the trees spoiled. When this is the case after the hedges are cut, the bare stems are all at once exposed to the winds; therefore, if you do not wish to see through a belt or plantation, and when handsome and useful trees are desired, the hedges should be cut at an early period—at all events frequently cut the inside spray off the hedge next the trees; this will prevent much injury to the lower branches, until the trees are of sufficient height to admit of the hedge being properly cut. On the sides most exposed to boisterous winds, the hedge might be kept higher, and longer in that state, than on the sheltered sides, provided the precaution is taken to trim the insides of them.

Nursery-work.—Attend to previous directions, except that watering and shading are not now wanted, as rain more or less has fallen in most parts of the country, in sufficient quantity for a time to suspend those operations.—*W. B.*

VII.—COTTAGERS' CALENDAR.

Pelargoniums which are now going out of flower may be removed to a situation in the open air, where they will be freely exposed to the sun. In the course of two or three weeks the wood will thus get thoroughly ripened, which will be known by its assuming a brown hue, and the plants may then be cut down and placed in a less exposed situation until they again start into growth. In what state are the summer things sown in the clumps or borders? Spring-sown annuals in many places have come up badly, and in some instances have never appeared at all. The warm and seasonable showers, however, which have fallen lately, have caused the seeds which have hitherto lain dormant to germinate and come up plentifully; but where this is not the case, small patches of such hardy things as Collinsias, Poppies, Convolvulus minor, &c., sown now, will, I have no doubt, flower soon and well, and, intermixing with the herbaceous plants, will render the borders gay in autumn. A correspondent writes—"I have just sown some French Beans, and also some Early Frame Peas, as I imagine this sort will do better than any of the late varieties, for it will come into use sooner, and will consequently be less liable to be attacked by mildew." If the cottager has a piece of spare ground, he had better sow a small quantity of this or some other kind for autumn use. Those who have Broccoli ready for planting had better get them put in soon, as the ground is in good order for their reception. Make room for them by removing crops of Peas or Beans that have ceased to be useful. If sufficient space, however, cannot be got in this way, plant between the rows of Peas, but previous to planting let the ground be well forked up. Plant Celery, and get in a main sowing of Turnips; likewise plant out in drills upon rich ground as many Leeks as may be wanted. Let the drills be about 12 inches apart, and the plants 6 inches in the drill. Brussels Sprouts, Savoys, and German Greens ought also to be planted out about this time. Cucumbers planted out of doors under hand-glasses will now be growing vigorously, and will require strict attention.—*J. McH.*

State of the Weather near London for the week ending July 11, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

ANTS.—*A Subscriber.*—We know of no effectual remedy for these troublesome little pests. Some recommend arsenic and sugar; others, a solution of corrosive sublimate and treacle; while a third party says lime-water or powdered quicklime expels, but does not kill them. Boiling water has also been tried, and this certainly will destroy them where it can be applied; but that is not often. Perhaps the remedy of most general application is flowers of sulphur. This, says a correspondent, effectually expels them, but does not appear to kill them. After its application, however, he says that they invariably leave the spot, and are not again to be found in the neighbourhood of their late locality. He adds that it affects equally the black and the red Ants.‡

BEES.—*A Lady.*—There is no necessity for having the discoloured combs cut from the centre box; the operation would inflict a serious injury on the brood; and it is not from that part of the hive that pure honeycombs are to be expected. You need not be afraid that old combs will produce weak or small bees. I have a prosperous hive eight years old. However, when the bees happen to die, the bad combs had better be cut out. As the slide was left out, most likely the dead bees found in the drawer died during the winter or spring, which is a common occurrence. But, supposing that was not the case, and that the hive had not swarmed, the old bees would die in the beginning of summer. This applies to the straw hive also, even although it was a first swarm this season; for it would contain old bees from the stock. In some cases intruders cause the slaughter. *J. Wighton.*

BUDDING.—*A Constant Reader.*—Plums are budded in the autumn when the bark runs, and exactly like other plants.

EMIGRATION.—*A Reader.*—The West India Islands are in want of *good* gardeners; but it is doubtful whether good wages can be had. A mere routine gardener would, however, be useless there. If a man would succeed he must thoroughly understand the *principles* of his business. A man who had been a gardener in the West Indies for two or three years would be of more value when he returned than when he went, *provided he contracted no bad habits.*

GRAFTING.—*What do Ants live on?*—It is absurd to suppose that these creatures have hurt your grafts. The work is well done, and the loss of so many of your scions has arisen from the excessively dry weather. Nobody is to blame.

GRAPES.—*J. W.*—Your very old Vine is probably getting worn out, and its roots may be too dry. It is therefore more likely to suffer from a hot sun than are the more vigorous kinds growing beside it; and such has evidently taken effect on the young bunch of fruit received. ‖

INSECTS.—*Oakly* says, "Having sown some Swede seed in a flower-pot with some guano, and finding that it grew very slowly, I examined the pot, and found many seeds on the surface in the state which you will see in No. 1, and on opening one, the small fly in No. 2 came out." No. 1 is not Swede seed, but Millet seed; No. 2 is the Thrips, which has no relation to either. Is our correspondent quizzing us?—*B. Chilo*—We are obliged for the satisfactory packet containing the wasp, flies, &c. *R.* All the questions that have reached us have been answered; but we cannot undertake in all cases to reply on the instant.

NAMES OF PLANTS.—*J. M.*—We do not recognise the leaves you have sent. Your Ferns are, 1, Aspidium Filix mas (?), in a young state; 2, Polypodium Dryopteris; 3, Aspidium lobatum; 4, Polypodium Phegopteris §—*Peter Mackenzie.*—Your Rubus seems a remarkable variety of the common Raspberry.—*Aen.*—Genista tinctoria, var. hirsuta. ¶.—*Inscius.*—Canary Grass.—*J. K. S.*—1, Carex paludosa; 2, Carex remota; no number, Mitella nuda. §—*H. E. B.*—Grewia orientalis.—*P.*—Epidendrum odoratissimum. We have nothing from you unanswered.—*Censorius.*—4. Orobus niger; 1, Cistus salvifolius. Nobody can tell the names of the other fragments. You should remember that plants cannot often be named unless good specimens are supplied.—*F. C. B.*—We really must once more decline naming foreign seeds. You cannot be aware of the enormous difficulty of doing so. Two days would not be enough for the task you propose.—*S. W. W.*—Datura Stramonium.

PELARGONIUMS.—*V. S.*—We can hardly explain your case. We should not refer it to the action of bees or insects; it is most likely to be connected with dryness of the air. We presume you have not described all the circumstances of your case, although no doubt you have intended to do so.

POTATOES.—*S. W.*—The sooner the Potato-blossoms are removed, the better. It is bad physiology to say that if the berries are prevented forming their poisonous matter, that matter will be transferred to the tubers. The materials out of which the fruit forms its poison will be transferred to the tuber, but in another chemical form—namely, that of starch. The Fig-tree bears sugary fruit; if you pull off the Figs, you will not, on that account, get sugar in the branches. The Cherry is red and pulpy; if you remove Cherries, you will not make the branches red and pulpy—and so on.

RHODODENDRONS.—*An Amateur.*—The following are very good free bloomers, and are tolerably hardy:—Russellianum, scarlet; Altaclerense, scarlet; Arboreum roseum, bright rose; Victoria, deep red; Venustum, pink; Augustum, pale flesh, spotted; Pulcherrimum, scarlet; Grandiflorum (Cunningham's), pale flesh; Macranthum, rose; and Knightii, scarlet. Rhododendrons may be grafted with success in August or September. After the scions are put on, the plants should have a little bottom-heat to set the sap in motion.‡

SOIL.—*W. H. B.*—Provided your soil is stiff enough not to burn, light enough to admit air into its crevices, and thoroughly drained, it does not much matter what its composition is. Equal parts of peat or leaf-mould, loam, and sand, make a good mixture If a little calcareous matter, such as the plaster and mortar rubbish of old buildings, be added, it will be an improvement.

STRAWBERRIES.—*I. G. H.*—In preparing ground for these, trench it well two spits deep, and manure on the second spit. The beds may be mulched in autumn. Spread the manure on the surface. The autumn rains will wash the substance of it down to the roots, and it will form a clean surface for the plants.‡

TULIP TREES.—*X. Y. Z.*—These are propagated by seeds imported from North America. If your tree is in health, why manure it? If you will not let well alone, employ good rotten farm-yard dung, dug into the ground as far from the bole as the ends of the branches.

VARIEGATED BEECHES.—*J. H Haycroft.*—This is very distinct from the old Variegated Beech and desirable if constant¶, for the gratification of those who admire variegated plants, which we do not in general.

WHITNEY'S COMPOSITION.—*J. G. H.*—Good calico is the best for this material. An Arnott stove will keep the frost out of a small house; but you must take care not to work it without a pan of water on the top.

MISCELLANEOUS.—*Icenus.*—Certainly, Berberis fascicularis is no twiner; nor can we find any statement that it is so in the page to which you refer.—*F. X. O.*—Your Erica tetralix aurea is uncommonly ugly. Do you mean to say that the roots of your Teasel plants have contained three pints of water each.—One shilling each will be given for No. 7, 1842, and No. 2, 1843.—*A. M.*—When your seedling Strawberry reached us it was quite rotten, and consequently in an unfit state for forming any opinion in regard to its merits.‡—*B. Chilo.*—We shall give our opinion on the merits of your Picotees if you send them.* —*Querist.*—Gentianella may be increased by dividing the plants early in autumn. The cutting of Asparagus should never be continued beyond midsummer; apply salt to the beds when the summer shoots are growing (see p. 444 of last week's Paper). Where seed is not wanted, the seed-vessels should always be taken off Rhododendrons as soon as the blossoms drop, for reasons previously given. Daphne Cneorum is propagated by layers. Annuals do not flower better for being sown in autumn, but they flower earlier next spring. Crops are benefited by having the soil stirred up between the rows in dry weather.‡—*Coniferæ.*—Abies Smithiana and Pinus Cephalonica are both perfectly hardy ‡—*Delta.*—Trap the blackbirds with rat-traps, baited with Cherries. The mode of preserving Gooseberries, Currants, &c., mentioned at p. 821, 1842, is as follows:—Take wide-mouthed glass, or, if possible, stone bottles; fill them by shaking, or even, if you like, by pressing them or mashing them with a round stick like a ruler. Then cork them tight with the best corks (for good corking is more than half the battle), using good deep chives, as they are called; wire down the cork strongly, and insert a small slip of wood between the wire and cork. Place the bottles upright in a boiler, filled with cold water, up to their necks; heat the water until it boils; keep it boiling ten minutes, and then withdraw the fire, or move the boiler off it. When the water is cool take out the bottles, and they will keep for years. They may be rosined; but with good corks it is needless, and is afterwards troublesome.—*A. E.*—We must beg to refer you to the numerous statements made on the culture of the Double Yellow Rose in previous volumes, particularly in a Leading Article at p. 811, in the vol. for 1841.‡—*Anne.*—Your specimen of a Carex piercing the root of Gymnadenia conopsea is curious. We have such a case with Couchgrass and Potato.

SEEDLING FLOWERS.

CALCEOLARIAS.—*Thos. A.*—Your seedlings are small, and inferior in the marking to the seedlings of the present day. Gipsey is the most uncommon.*

FUCHSIAS.—*J. B., Durham.*—Your seedling is a finely-formed flower; tube and sepals of the most delicate pink, approaching to white; corolla rose, with a slight tinge of purple: a clear and brilliant flower, the best of its colour we have yet seen.*—*H. M.*—None of your seedlings are improvements upon varieties already in cultivation, and they are all deficient in the colour of the corolla.*

GLADIOLI.—*E. H. Krelage, Haarlem.*—Your seedlings appear to be crosses between G. cardinalis and G. blandus, the former variety predominating most in the offspring. They are very beautiful, like all such crosses. The colours range from very pale red to a deep rich vermilion. Many, however, bear too strong a resemblance to each other, the difference of colour being very trifling; and in two or three instances the form of the flower is not good, the petals being very narrow. Eclatante frappante is an example of want of form. Seedling No. 41 is a rich, splendid, and distinct colour; and Lord John Russell, Prince Albert, and Queen Victoria are very good varieties of a pale colour. We should say that seedling No. 41 is the cream of the batch. All are wonderfully well grown. A selection of the most distinct varieties would be acceptable to any garden.

PANSIES.—*T. C.*—No. 1 is a flower of good form and substance, but the faint and uncertain colour in the top petals is objectionable. 2, white pure, eye clear and well defined, flower flat, edges are a little too uneven. 3 is an inferior flower, and wants the blotch on the side petals to complete the eye. 4—the shield, or centre, of this flower wants defining, and the lip is too small, in proportion to the other petals. 5 is your best flower—round, flat, and of good substance; the side petals meet closely above the eye, the proportion of the petals is very fine, and it is more novel than the others.*

PELARGONIUMS.—*I. D. J., Brussels.*—Your seedlings are generally deficient in one property, regarded in the present day as essential in constituting a fine flower—viz., form. In substance they are very good, and in colour some of the varieties are fine, such as 480, 481, and 460; the colours of these are high and fine; 415 is also clear and good. 285 is an improvement in the form; the under petals are short and broad, but the colour is poor and uneven. Your flowers generally are small, and wanting in form, compared to the varieties raised of late years in this country.*—*P. F.*—There is nothing remarkable in your seedlings; they are common in colour, with the top petals rather pointed, and the bottom ones too narrow. 12 and 10 are the two best; the latter is a repetition of Matilda, with a fine spot running to the base of the petal.*—*R. W.*—Rembrandt is a bright and very pretty seedling; from its colour and firmness of petal well adapted for bouquets; it is deficient in form, compared to recent varieties.*—*W. R., near Devizes.*—Both your seedlings are pretty flowers: No. 7 is the better form; 10 has fine top petals, but the bottom ones are rather too long; both are good in colour.*—*J. W.*—Your seedlings from P. tricolor are pretty in colour, but the flowers want size to render them desirable.*

PETUNIAS.—*W. R., near Devizes*—Of your seedlings, No. 2 is the best; the colour is rich and fine, and the flower well formed. No. 1, though showy, is not uncommon in colour; and the divisions in the corolla are too deeply indented. Compare the form of this with No. 2. 3 and 5 are not rare, though rich in colour; and 4 is common. P. punctata is a variegated variety.*

PICOTEES.—*P. W.*—Your two seedlings can only be regarded as border varieties.*

PINKS.—*R. B. B. B.*—The serrated edge is the great fault in your Pink; in other properties it is very good; the pod is well formed, white pure, colour rather novel, and the lacing perfect.*

POTENTILLAS.—*J. M.*—If the supposed origin of your flower from P. leucochroa is true, then it would seem to be a cross between it and P. atrosanguinea. Is it any improvement on the latter?

ROSES.—*W. W. & S.*—Your seedling Gallica, named *Margaret Mary*, is a handsome variety—fine in form, being compact and very double, with the outside petals finely cupped; in colour it is of a purple rose, of a peculiar and beautiful tinge; it is fragrant, and at its best when fully expanded; this is owing to the bud not being handsome in form, and one or two of the petals having a bruised appearance, which may probably arise from the season, or accident. The foliage is of a deep, rich green, short, and very handsome.*

*****As usual, many communications have been received too late.**

SEED-WHEAT.—Any one desirous of purchasing Seed for next year is invited to inspect the two varieties of Wheat, SHIRREFF'S HOPETOUN and MORTON'S RED STRAW WHITE, 120 acres of which are now growing on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE.

The present is the only season of the year when the value of any variety of Wheat as Seed can be ascertained by inspection; for, if the examination of a mere sample of the grain, which can be seen at any time, be nearly uninstructive as to its quality in the eye of the baker (see *Ag. Gazette*, No. 5), it is entirely so as to the productiveness or habit of growth of the variety to which it belongs. These points, which are of the highest importance in the eye of the Farmer, can be ascertained only by an examination of the growing plant when in full ear.

JOHN MORTON, Whitfield, Thornbury.

The Agricultural Gazette.

SATURDAY, JULY 13, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	July 17	Agricultural Society of England.
THURSDAY,	July 18	Agricultural Imp. Soc. of Ireland.
TUESDAY,	July 23	Meeting, Implement, and Cattle Shows of the Agricultural Society of England, at Southampton.
WEDNESDAY,	July 24	
THURSDAY,	July 25	
FRIDAY,	July 26	
THURSDAY,	July 25	Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

July 25	Richmondshire. Grove Ferry.	July 27	Cardiff. Gloucester.
July 26	Debenham. Stoke Ferry. Halesworth.		

DOUBTLESS most of our readers have heard of the AGRICULTURAL MUSEUM AT STIRLING, established and conducted by Messrs. Drummond and Sons. That institution has not only been of immense benefit to the agriculture of the district in which it is placed, but it has, through its numerous visitors, greatly furthered the progress of good farming generally. Now, all the advantages which this establishment has conferred on Stirlingshire, may equally be secured for any district in the kingdom by any one who will adopt the simple measures necessary for the purpose. And should any one feel desirous of making such a patriotic attempt, having made inquiry as to the steps taken by the Messrs. Drummond in the early history of their Museum, we publish the result for his information.

But first let us direct attention to the following statement by S. D. Stirling, Esq., of Glenbervie, which he, as a Stirlingshire landlord, gives of the advantage of this Institution.

"In reference to the following statistics of the Stirling Agricultural Museum, I shall notice a few of the advantages which a wide district has derived from this establishment; and which are equally within the reach of any district where the landlords choose to give a helping hand to those whose interest in the land is as great, though not as permanent, as their own. A detail of these will be the easiest mode of pointing out what are the requisites for the successful establishment of such an institution. The Messrs. Drummond possess a practical knowledge of all matters connected with agriculture and horticulture—this is one requisite; and they are ever ready, either themselves, or by the aid of their numerous friends, to test the value of any alleged improvement either in seeds, roots, or agricultural implements. Thus quackery cannot go long undetected, and the farmer, by seeing a great variety of the articles he may require, and having access to the opinion of those who, being unbiassed, have properly tested their respective merits, is able to judge what will best suit his wants or his means. Another advantage of this institution lies in the emulation which is excited amongst the tradesmen who supply the different implements to the Messrs. Drummond; for if the articles furnished by one are in any respect inferior to those of his neighbours, either in material, form, or workmanship, the want of demand soon puts all to rights. Messrs. Drummond also spare neither trouble nor expense in procuring such implements as are most approved from every district, however distant: they have thus obtained for their Museum such a name that orders are sent from distances to which the cost of transit alone would appear to be an insurmountable obstacle. To this Museum all are admitted, and the uses and merits of each article exhibited are explained; nor does this attention always go unrewarded, for much useful information is often obtained from casual visitors, which is again circulated; and an extensive connection is thus formed, through which all questions respecting agricultural matters are readily answered.

"There is also a large collection of Grains and Grasses in the straw, from which many a useful lesson is to be learned; and being labelled in a manner to be understood by the agricultural classes generally, to those who may have been charmed and misled by fine names, it becomes evident that Anthoxanthum odoratum and Cynosurus cristatus are neither more nor less than sweet-scented Vernal and Dog's-tail Grass, generally too prevalent in soil which they affect, and too unproductive to deserve to be placed where they can be kept out. It is also explained which Grasses are best suited for particular soils and particular purposes; which varieties of Grain are best adapted for situations where the crop may be expected to lodge, and, where this is inevitable, which will suffer least from being laid. Specimens of root-crops are also annually sent to this Museum by the agriculturists, and their different merits are freely commented on; and whereas, at first, size was principally aimed at by exhibitors, good shape to turn the rain, and specific gravity, as indicating solidity, are now considered of more importance.

"It would be tedious to enumerate all, or nearly all that is to be found in this Museum, which has been collected by the unwearied attention of the Messrs. Drummond; suffice it to say, that it is calculated to exert as useful an influence as any establishment of the kind in Europe, and that to it the district and Scotland is much indebted for its advanced state of agricultural improvement."

The following is the answer of the Messrs. Drummond to an inquiry into the statistics of their institution:—

"It was chiefly from witnessing the advantages resulting from collections of vegetable productions at Horticultural Shows, and from observing the interest excited by fine specimens of Agricultural produce, which were occasionally sent to their premises for exhibition, that W. Drummond and Sons conceived the idea of affording, as far as possible, an opportunity for such exhibitions on an enlarged and regular plan.

"The following is a copy of their first circular:—

"'*To Agriculturists.*—It is proposed to exhibit at the premises of W. Drummond and Sons, Stirling, on the 11th of November next, and the three succeeding weeks, specimens of all the varieties of Turnip, Carrot, Potato, and other roots and seeds connected with the agriculture of this district. Such specimens will be received from any quarter, betwixt this and the above date; and as it is of importance to have these productions properly labelled, it is very desirable that they should be accompanied with a note stating the name of the variety, by whom grown, the weight or measure of each, the produce per acre, description of soil, and the kind and quantity of manure applied, &c. Those interested are respectfully invited to an inspection. — *Stirling, September* 27, 1831.'

"The proposal was promptly and well responded to, for at this first essay there were above 80 lots of roots, and 160 specimens of grain, also a few implements shown. The contributors were above 200, the visitors several thousands, of all ranks.

"A Report of the Exhibition was published in December, 1831, wherein it is remarked, that in matters of substantive fact there are no means of acquiring knowledge so convincing and abiding as those afforded by the eyes and the hands, and that men cannot form just ideas of the relative value of any subject without comparison, and the more extensive in number and condensed in position the subjects of that comparison are, the more evident and correct will their relative characters appear. In agriculture, such opportunities of comparison had hitherto seldom occurred, but it was hoped that this Exhibition would form the germ of a system destined to grow and flourish. Early in the succeeding year (1832) circulars containing a fuller prospectus and details were issued. The specimens shown were multiplied and varied, with a more specific and correct labelling. The interest excited and number of visitors increased. This second Exhibition continued from 16th November till 16th March following. A report, with communications, was thereafter published. In the Preface it is observed that, "To speak of the merits of this mode of circulating agricultural knowledge is rendered unnecessary by its already felt advantages, and by the cordial approval of competent judges. The machinery of such Exhibitions being of the most simple kind, may easily be adopted by any agricultural association." The third year (1833) the Exhibition was commenced earlier, on account of the Highland and Agricultural Society of Scotland holding its annual meeting in Stirling that year. The collections of specimens and implements, &c. far surpassed the preceding ones, and were inspected with approval by the thousands of agriculturists who attended the great meeting, and the Directors of the Society soon afterwards signified their approbation by the award of their Gold Medal to 'Messrs. Drummond, in approbation of their having originated an Exhibition of seeds, plants, and other specimens useful in the operations of practical agriculture.'

"A third Report was published, and the Exhibition rendered permanent under the designation of an Agricultural Museum or Repository. With this Report were given also several excellent communications, particularly Remarks on thorough Drainage and deep Ploughing, by Mr. Smith, of Deanston; by which and by his valuable counsel and assistance in the whole undertaking, that gentleman has eminently contributed to its success. It happened most opportunely also, that spirited and well-conducted improvements were in progress at Polmaise, Glenbervie, Keir, Blair-Drummond, and other estates in the neighbourhood, the proprietors of which have ever given their most cordial and efficient support.

"The Agricultural Museum, in connexion with the Warehouse, has continued to prosper, the connexion being of mutual advantage; for the Warehouse contains full-sized implements, &c, daily coming in, and exhibits the successive improvements of various makers; it prevents the stagnation which must more or less take place in the interest excited by collections of mere specimens and models; the demand, too, which here takes place for particular seeds or implements affords a fair and therefore a useful test of their value.

"In 1840, for the better conducting of the establishment, a large building was designed and erected, consisting of four halls or floors, each 160 feet in length, and 20 to 25 feet in breadth; the two uppermost being chiefly allotted to the Museum, the two undermost to the Warehouse; and in December, 1843, an Agricultural Museum and Warehouse, in connexion with their Stirling one, was opened by Messrs. Drummond and Sons, in Dublin, which has met with the greatest encouragement.

"The number of visitors has nearly doubled within these few years, and may now average 1000 per month, including many strangers, and often foreigners, who visit Stirling in their route, and gentlemen connected with agriculture, who frequently come from a distance on purpose to inspect the collection and the farming improvements of the district. The frequent and careful inspection, and the purchase and trial of new and improved seeds and implements, which might not otherwise have come under observation by those active as improvers, afford ample proof of the value of the Agricultural Museum in helping them forward. And very seldom indeed have any, although not naturally improvers, been found so apathetic, on viewing the whole collection, as not to feel and express an increasing interest in its objects.

"In regard to the matter of finance, or the support of the Museum as distinct from the Warehouse: after the first three years, the outlay having become considerable, a small fund, the proceeds of admission tickets and subscriptions of agricultural friends, contributed partly to the expenses; but, business transactions increasing its maintenance, this had for a number of years been thrown wholly on the profits of the Warehouse, which are derived not from higher prices, however, on the goods—as they, equally with those of other salesmen, are exposed to competition—but by extent of business conducted with economy and attention."

The concluding paragraphs of this statement are worthy of attention. It appears that this Museum has not only been a source of profit to the neighbourhood in which it is placed, but also, through its visitors, who naturally become customers, to the spirited proprietors of it. This is a very important point, and one which justifies the anticipation that much of our future progress in agricultural improvement may be owing to the operation of Museums of this description, hereafter to be established by seedsmen, agricultural implement makers, and others, over the extent of the country.

No *additions*, whether through the aid of scientific men or otherwise, to our present knowledge as farmers, valuable though it might be, can exceed in national importance the benefits which would follow the universal diffusion of what is already known, though it be by few; and this can only be obtained through the influence of example farms and *Agricultural Museums*.

AFTER a season of UNEXAMPLED DROUGHT the country is at length blessed with refreshing rains. The effects of the weather we have experienced are reported as follows:—Wheat has not suffered much injury except on light and shallow soils. A gentleman who has lately travelled through the counties of Essex, Herts, Bedford, Northampton, and Lincoln, and through Buckinghamshire, Oxfordshire, Berks, and Gloucestershire, informs us that if it be harvested well, he anticipates a full average crop. In Scotland again, where the weather does not appear to have been so dry, still less injury, if any, has been done.

With regard to all spring Corn, however, a very different report is given. Beans and Peas will be a very poor crop; Oats and Barley will not only be comparatively unproductive per acre, but the breadth of land sown, especially of the latter, is much less than usual—farmers having in many cases delayed sowing till too late, in the hope of wet weather.

The Hay crop is one of the lightest ever known; and less than the ordinary extent of Grass has been mown—much that was intended for Hay having been required for the cattle, owing to the failure of the pastures.

The Potato crop is in many districts a failure; many cases are reported in which the seed has been sown twice, but has never sprouted. Turnips, though sown late, or rather through brairding late—for the seed may have lain dry in the ground for weeks—may yet yield a plentiful crop if the weather be favourable. Mangold Wurzel, in all cases which we have heard of, is a failure: the dry weather set in just at its seed-time.

The most favourable account that can be given of the present condition of the farmer's prospects, is that if the weather be suitable, the Wheat crop will probably be early and plentiful, and that we may yet have good crops of Turnips, and of aftermath Grass.

The accounts of the appearance of the crops in Scotland are generally more favourable than those from most districts in England.

EFFECTS OF CHARCOAL AND SALT ON THE SWEDISH TURNIP.

HEREWITH I send you three plants of Turnips, (Skirving's), sowed on the same plot of ground, at the same hour of the same day. In the case of the largest specimen, the seed was well mixed with about twelve times its bulk of charcoal-dust. In that of the next size, the seed was mixed with five times its weight of common salt, and nine bulks of charcoal; and in the case of the plant just come up, the seed was put in quite alone. In all three cases the seed was put in drills in soil which last year bore Mangold Wurzel in seed, and the year before Wheat, and no manure has been applied since. My object in using the charcoal and salt was from the consideration that both substances are powerful absorbents and retainers of moisture, as well as direct food for plants.

Nos. 1 and 2, in spite of the parched state of the ground, (the 3rd June) came up strong in five days, and continued growing; No. 1, however, soon and rapidly taking the lead. At the end of a fortnight all three rows were once watered, which however failed to bring up the seed sown without anything. When our first rain came heavily, ten days ago, No. 1 grew almost visibly, and three or four days after, No. 3 just began to show. I may also state that I sowed Belgian Carrots with charcoal only, the first week in May, and though the soil then was quite dusty, and so continued until ten days ago, the plant came up well in three weeks, which is at least ten days sooner than Carrot seed usually comes up, even under favourable circumstances as to rain. I sowed one more row of the Turnip, with a double quantity of salt, which seems to have destroyed the seed, as none has yet appeared. If you think these experiments worth noticing in your excellent Journal, you are quite welcome to do so, and I shall feel happy if so simple a substance should prove of use in forcing a plant of Turnips, or other roots.—ESSEX, *Cassiobury, Watford.*

[We are exceedingly obliged to the Earl of Essex for this interesting communication. Of the specimens sent, No. 1 appears to be a plant which has had about six weeks' vigorous growth; No. 3 has not yet acquired its rough leaf; and No. 2 is of a medium size. This extraordinary difference in plants sown at the same time, on the same plot of ground, appears to be wholly owing to the simple means adopted, as described above, which, from his Lordship's experience, certainly appear to be well worthy of extensive trial.]

SKETCHES OF EAST LOTHIAN HUSBANDRY.

3. HOEING IMPLEMENTS.—These include the several instruments employed in tilling and pulverising the intervals of plants cultivated in rows. It has been already stated that some of the cereal Grasses, particularly Oats, were, under peculiar circumstances, sown in rows. The implement most commonly employed in tilling the intervals is the hand-hoe; but where the system is practised to any considerable extent, a machine drawn by one horse, consisting of a series of flat triangular shares, nearly as wide as the intervals in which they are to move, and attached to a frame supported upon wheels, is sometimes employed. This implement in its present imperfect condition is not found easily manageable or very efficient, and is therefore but very seldom used.

A hoeing implement of general use is the small paring-plough already referred to. Its purpose, as its name implies, is to pare away a slice of earth from the sides of Bean, Potato, or Turnip drills, before horse-hoeing or grubbing the intervals. The other implements of this class are several kinds of drill-grubbers, horse-hoes, scufflers, &c., designed to follow the paring-plough, and further to reduce the soil pared from the drills, and to drag to the surface weeds of every description. Drill-harrows with attached hoes of various shapes, were until lately much used for these purposes, but are now nearly altogether dispensed with, at least on the heavy clay farms; the drill-grubber, an implement with cutters only, being found to perform more effectually the double purpose of dragging weeds to the surface, and of pulverising and tilling the intervals between the rows of plants. The drill-grubber, it may also be remarked, frequently supersedes the use of the paring-plough. The operations of the drill-grubber are chiefly confined to Bean and Potato culture; a lighter implement with teeth similar to those of the common harrow, rather appropriately termed a scraper, being generally used for Turnips.

4. BARN MACHINES.—East Lothian has the undisputed honour of being the county in which the *Threshing-machine*—decidedly the most valuable rural implement ever invented—was first originated and employed. Threshing by the flail is now almost, but not altogether, unknown here. I am aware, however, of only one solitary instance of a farm in the Lowland district in which this rude instrument is still used, but it is very common in the Lammermoor district, as the quantity of Corn grown there upon any farm does not warrant the expense of erecting a threshing-machine. The usual size of the machines employed on farms of from 300 to 500 acres is that requiring the power of six horses to propel it. Machines driven by four horses are used on arable farms under 300 acres, where any one is used.

Threshing-machines, on the larger class of farms, are now generally driven by steam-power. Water, as being even still more economical, is preferred and used where a sufficient supply of it can be had; but where this is not the case, steam-power is employed. Wind-driven machines were, until lately, very numerous; but this, as well as the most expensive and objectionable of all—horse-power—has gradually given way to the steam-engine, which has been found to be much more uniform and expeditious in executing its work than either. In 1805, when Somerville wrote the Survey of the County for the Board of Agriculture, there was but one threshing-machine in it driven by steam, but farm-engines are now so numerous, that Sir Thomas B. Hepburn, member for the county, has been somewhat appropriately styled the representative of tall chimneys. The engines most commonly used are what are termed high-pressure, or non-condensing; condensing-engines are also employed on some farms, but they are not so simple or so cheap as the former. Six-horse-power engines are the most numerous, although, on very large farms, eight-horse-power engines are not uncommon.

The chief advantages of steam power arises from its great economy, particularly in a locality where coals are abundant and cheap. A cart-load of about 15 cwt. of small dross coal, purchased at the colliery for a shilling, will, in ordinary cases, supply with fuel a six-horse-power engine for 10 hours, during which time from 35 to 45 quarters of grain may be threshed. The quantity threshed in a given time will, of course, depend upon its quality and the length of the straw; but under favourable circumstances, and with an average quality of grain, from 4 to 5 quarters of Oats or Barley, and from 3½ to 4½ quarters of Wheat, may be threshed in an hour. Little need be said here about the threshing-machine itself, as it is now well known to every person engaged in agricultural pursuits. Alterations and improvements have, no doubt, been made in some localities on certain parts of the machine, but all its essential parts, and the principle of its construction, are the same everywhere.

When the threshing-machine is made to be driven by water, it is usual also to have a horse-course and apparatus attached, for the purpose of applying horse-power when a sufficient supply of water cannot be obtained. By varying the positions of the pinions on the common shaft, which communicates with the horse and water-wheels, either power can be used separately, or both may be combined when the water is unable to propel the machine alone.

The number of persons requisite for working a threshing-machine of the usual size—a six-horse-power—is generally seven—four women and three men. Two women loosen or unbind the sheaves and lay them upon the feeding-board, to the man who supplies them to the machine, and other two women are required in the under or corn-barn, to remove the grain as it falls from the fanners attached to the threshing-machine. Two men are necessary for carrying away the straw ejected from the machine, to be piled up for use either in the straw-barn into which it falls from the machine, or in the stackyard. Wheaten straw, to be used as litter, is generally conveyed at once to the yards in which it may be required.

A threshing-machine and all its necessary appendages, together with a six-horse-power high-pressure engine, may now be erected for about 150*l.*

Winnowing-Machine or Fanners.—The winnowing-machines are nearly the same as those in general use in other parts of the country, and therefore do not require any lengthened description in this place. One pair of fanners is invariably attached to, and driven by a leather belt or chain from the threshing machine. Besides this one, which separates the chaff from the grain before coming to the ground, another is used for dressing or preparing the grain for market, generally worked by the hand, but frequently also by means of a belt from the machine. Instead of the wire sieves so commonly used in the interior of winnowing-machines, a strong canvas cloth revolving upon two wooden rollers is by some farmers preferred and employed. From six to seven quarters of Oats is the usual quantity which can be once winnowed in an hour, by a machine in good order, and actively worked. Best fanners, with sieves and riddles, may be had for 8*l.* to 8*l.* 10*s.*

The only other machines belonging to or worked in the barn, are a *Hummeller* for the purpose of separating the awns from the grains of Barley, and a machine for bruising Oats, Peas, or Beans, for horses or other animals, both of which are driven by the same power that propels the threshing-machine. The threshing, hummelling, and winnowing of Barley always proceed simultaneously, but the bruiser is seldom worked with the other machines, as the motion necessary for threshing is considered to be too rapid for the purpose of bruising properly. Besides the machines already mentioned, a churn and a straw-cutter are also not unfrequently worked in connection with the threshing-machine.

5. WHEEL-CARRIAGES OR CARTS.—Every farm is provided with several kinds of carts, each adapted to some particular species of work; some are in daily employment while others are used only on special occasions.

Single-horse Carts.—Formerly, on account of bad roads and other causes, none but two-horse carts were used in this county, for the different purposes of farming, but single-horse carts are now generally preferred and more frequently employed, especially in long journeys, conveying Corn to market and coals from the colliery, &c. The superiority of the single over the double cart, consists in being much lighter, more steady and compact, and consequently less shaking and burthensome on the shaft-horse. The majority of single-horse carts are made with the body permanently fixed to the shafts; this construction being supposed to render the cart more steady and compact than the turn-up or coup-cart. In the economy of the farm, every ploughman has the charge and management of a pair of horses, and when carting, he drives them both himself. When using single carts, one follows the other, the horse of the last cart being fastened by a short rope from his bridle to a ring in the hind-door of the foremost cart. These carts are usually 4½ feet in length inside the boards; 3 feet 2 inches in breadth at bottom, and 14 inches deep. Price, with wheels and axle, 9*l.* 10*s.* to 10*l.*

The Double-horse Cart differs little from the single cart except in being larger and stronger. It has sometimes a fixed but most generally a turn-up body. Double-horse carts are now employed only in carting out dung from the yards to the fields, earth or other heavy materials. Although single-horse carts are, beyond a question, the most economical and profitable for general purposes, experience has fully decided that the double-horse cart cannot be altogether dispensed with; and is invariably used for conveying dung to the fields during winter, when farm roads are not generally in the best condition. A two-horse cart is commonly 5 feet long within the sides, 3½ feet in breadth, and 17 inches high. With side-boards it will contain, if well filled, about two cubic yards of dung. Price, with wheels and axle, 10*l.* 10*s.* to 11*l.*

The Corn-cart consists of a sparred frame-work, with the bottom and part of the sides boarded, and is used solely for the purpose of carting Corn in the sheaf, hay, or similar materials. When being employed, this cart is mounted upon the wheels and axle of any of the close carts, and may be drawn by one or two horses according to circumstances. No species of cart is better adapted to the purpose for which it is intended than this. None admits of a larger load with the least possible trouble to the driver or horse. The only alterations or improvements lately effected in the construction of the Corn-cart consist in making the body wider and dispensing with the usual side-rails. Corn-carts of this description are now much used in the hill-district; they have no side-rails; one cross-rail supported upon two upright iron stays prevents the Corn from falling forward on the horse, and two semicircular bars of iron-halves of wheel-rims answer the purpose, serve to keep the wheels from disturbing the load, and support a strong board nearly bisecting the cart, on which the driver stands while forking the sheaves to the stacker. The object of this form is to render the cart less liable to be overturned in uneven situations. In some of the Corn-carts now made, the rails are so fitted to the body, that they may be taken off and replaced at pleasure, and the body used for carting wood, &c. The usual dimensions of the Corn-cart are—length of rails, 10½ feet; height of spars, 20 inches; breadth 5½ feet.

Cart-wheels are generally 4½ feet in diameter; cast-metal naves were in much vogue some time ago throughout the county, but have now fallen into disuse. Great attention is paid to the fitting of the axle.

In this hasty sketch of the principal implements and machines in general use here, I have omitted even to name a very considerable number of others of minor importance, but the most of them shall be noticed when I come to speak of the different operations in which they are employed.—*T. Sullivan.*

SCIENTIFIC EDUCATION.

THE following account of the half-yearly examination of the scholars of Messrs. Nesbit, of Kennington House Academy, abridged from the *Maidstone Gazette*, is inserted here with the view of placing before our readers Dr. Reid's excellent remarks on the value of a scientific education even to those who may only receive from it an *indirect* benefit. Of how much greater value must it be to those who, like the farmer, daily superintend operations dependent for their success on the favourable development of scientific principles!

At the hour appointed for the examination, Dr. D. B. Reid, F.R.S.E., took the chair, and the schoolroom was completely filled with a respectable audience. After a short address from Mr. J. C. Nesbit, various literary selections were recited by some of the pupils. A very satisfactory examination in geometry, by J. Imray, Esq., M.A., was then conducted, and after an extended examination in geology, by Mr. Richardson, of the British Museum, one of the young gentlemen, assisted by the members of the Chemistry Class, delivered a short lecture on chemistry, and was highly complimented by the chairman and applauded by the audience.

Dr. Reid, in the course of his remarks, after the conclusion of the recitations and examinations, said no one felt more desirous for the promulgation of a knowledge of modern science than himself. Where he had received his education, there were upwards of 200 boys in his class, and upwards of 800 altogether in the school, and he had had the good fortune to meet

with some 50 of these in after life, and whenever their conversation recurred to the scenes of their early days, their exclamation had constantly been, "Oh that we had had the same opportunities of acquiring modern languages—the same facilities for acquiring scientific knowledge—which exist in these days! How much we should have been enabled to do which we have been obliged to leave undone! How much more might we have appreciated, and perhaps contributed to, those splendid realities in physical science which are now shedding their beneficial influence over every country of the globe!" When he and his old associates looked back upon their own difficulties, it was doubly gratifying to them to witness the advantages which were placed within the reach of their young friends, whose exertions had afforded the audience so much pleasure in the course of the evening. From what he had seen he could not doubt that they had felt much delight in acquiring the knowledge they had displayed. He could fully appreciate the delight of all persons who loved the promotion of education, at the successful results they had seen of the attempt to combine the knowledge of foreign languages and modern science with the usual branches of education. It was to an improved knowledge in these branches of education that they must look for an extension of that intercourse, and a strengthening of those bonds of mutual sympathy, which were calculated, the more they were extended, to connect man with man, in the pursuit of objects of the most elevated kind. He could not pass over, without particular notice, the chemical lecture which they had heard from one of the pupils. He could not recommend too earnestly to the young persons present the necessity of acquainting themselves with chemical science. That young persons might do so, had been most successfully demonstrated on that evening. The cultivation of the love of science in young persons was of the highest importance, even if it had no definite purpose in connexion with their pursuits in after life, which it sometimes influenced materially. The difference between youths who had been thus educated and those who had not, was apparent to the most superficial observer. Their mode of thinking, and even the tone of their conversation, were influenced by this mode of training to a very great extent, and he was satisfied that the great exertions of their teachers would be appreciated more and more as their pupils advanced in life, and found the immense advantages of their education on the principles adopted in this school, which would entwine themselves with all their habits and associations, as well as with the varied duties to which their future occupations might lead them. Physical science was universal in its operations, and necessarily embodied everything that was associated with the useful arts, as well as with the comforts and elegancies of life, and in one department, viz., agriculture, the young pupils preparing for this profession would only be astonished as they proceeded, at the long and lingering slowness with which the farmers had hitherto taken up and applied that knowledge, particularly of chemistry, which gave significant proof that it would soon do as much for agriculture as it had already achieved for arts and manufactures. Those who had not been thus educated were frequently consuming their time unprofitably both to themselves and others. But when acquainted with science, young persons were constantly engaged in the discovery of new facts, or in some inquiry which had for its object the pursuit, development, and demonstration of truth.—*M. S.*

ON LIQUID MANURE.—No. II.

In pursuing the subject of the best and most economical ingredient for fixing the ammonia generated during the putrefaction of urine, we next come to sulphate of lime, known as gypsum, plaster stone, alabaster, or plaster of Paris; it exists abundantly in many parts of England, and is composed of—

Lime	28.5
Sulphuric acid	40.0
Water	18.0
	——86.5

If gypsum be subjected to a red heat, it parts with its water, is easily reduced to powder, and is known as ordinary plaster of Paris: in this state it has a great affinity for water, readily combining with it, and in a short time setting into a hard mass. Sulphate of lime is sparingly soluble in water, at ordinary temperatures; 500 parts of water only dissolving one part of sulphate of lime. It exists in some soils, and is dissolved by rain water as it sinks through the earth. Hence it is found in the waters of many springs and rivers, and it is frequently the cause of hardness in water.

Gypsum strongly recommends itself to the English farmer, from the low price at which it may be obtained, as a means of converting the volatile carbonate of ammonia contained in putrid urine into a sulphate of ammonia, which is not volatile. But to insure its producing this effect, it is necessary that it should, in the first place, be reduced to an impalpable powder, since it is only when in solution that gypsum can be decomposed by a solution of ammonia, and as it is so sparingly soluble, every precaution is necessary to insure success; and since, the finer the powder it is reduced to, the more readily soluble does it become, it is necessary that this point be closely attended to. If it were only crushed or coarsely ground, it would be in vain to expect it to become soluble, or to fix the ammonia. It is also necessary, in the second place, that the powdered gypsum be frequently raked up from the bottom of the vessel or tank in which it is used, since it is only by frequently bringing it into contact with fresh portions of liquid that its solution is effected.

When gypsum is once dissolved, it readily undergoes decomposition with the ammonia contained in the urine. This occurs in the following manner:—The sulphuric acid, which is in combustion with the lime in gypsum, quits the lime and combines with the ammonia, forming sulphate of ammonia; while the lime, the other constituent of the gypsum, combines with the carbonic acid which was in combination with the ammonia before the formation of sulphate of ammonia, and forms a carbonate of lime or chalk; this subsides to the bottom of the tank, and will require to be removed occasionally; the following diagram will show the change which occurs in the constituents:—

From the difficult solubility of gypsum, only a small portion of it can be taken up in solution at any one time, which portion soon undergoes decomposition, and may be replaced by another portion, and so on until all in its turn has become soluble, and undergone decomposition, this change being greatly facilitated by frequent agitation; in fact, without it, the gypsum would remain at the bottom of the tank as an inert mass, while the ammonia would continue to escape from its surface and be lost. From a series of experiments I have lately conducted to ascertain the relative power of different substances to form fixed salts of ammonia, I found that it required several days before the ammonia in putrid urine was effectually converted into a sulphate by the use of gypsum reduced to powder, even when the contents of the vessel was stirred twice a day. The same result was attained in less than half the time when a sulphate of lime was used, which was expressly prepared for the purpose by precipitation; this was owing to a more minute state of division of the particles of the sulphate, and, consequently, more ready solubility.

When burnt gypsum was used it became partly consolidated, and consequently of little effect, until again reduced to powder, when it acted effectually. When imperfectly powdered gypsum was used, only those portions underwent decomposition which were reduced to a fine powder, the outer portion of the coarse granular powder becoming coated with a crust of carbonate of lime, which totally prevented any further action of the ammonia on the gypsum inclosed within. Hence it is evident that unless gypsum be reduced to a very fine powder, it cannot undergo perfect decomposition, and also, that this action is greatly facilitated by frequently stirring the mixture.

As a proof that the decomposition of the gypsum has taken place, the following test may be applied:—Remove a portion of the precipitated powder, place it in a glass vessel, and pour over it vinegar or diluted muriatic acid as long as effervescence occurs; should a portion of powder remain undissolved, it will, in all probability, be undecomposed gypsum, but should the whole dissolve with effervescence, the decomposition of the gypsum has been complete. It would always be advisable to have a portion of undecomposed gypsum in the tank, ready to act on the ammonia as soon as generated, and to have the contents well stirred, at least twice a week.

In using sulphate of lime or gypsum in liquid manure, to convert the ammonia into a sulphate, for every 148 lbs. of (unburnt) gypsum, one cwt. of sulphate of ammonia will be formed; the same quantity will be obtained by the decomposition of 118 lbs. of burnt gypsum, or common plaster of Paris.*—*Alfred Gyde, Painswick.*

(To be continued).

* The urate of the London Manure Company is said to be gypsum heated to redness, and thrown into putrid urine, then removed, dried, and crushed.

Home Correspondence.

Fixation of Ammonia.—There is a slight mistake in the Notices to Correspondents of your Paper, June 15th, upon the subject of my experiments with sulphuric acid as a fixer of the ammonia in decomposing urine. According to my experiment, 16 gallons of putrid urine require for neutralisation 60½ ounces by weight of sulphuric acid of sp. gr. 1.850. The quantity, however, will vary according to the strength of the acid, or the state of decomposition of the urine. I should prefer using diluted acid, in the proportion of 1 pound of acid to 6 or 8 of water, adding the solution until all effervescence ceases. The composition found to be of so much value by your correspondent "H. D.," of Witham, is strictly in accordance with chemical theory, or rather fact. "H. D." supplies to his plants all the elements of their composition. The crop being Turnips, the loss of the ammonia of the urine is not felt. If he were to fix his urine with dilute sulphuric acid, and then use it in the same way and apply it to Wheat or Beans, he will have excellent crops. In the way in which he has used the urine, it is probable no fresh combinations were entered into, or were necessary. Bones, charcoal, and urine contain everything, except silica, which the plant requires; and of this Turnips want little or none. Chemical Science will, in the end, attain its proper position in Agriculture. Practice may be, and is frequently wrong. Science may be applied incorrectly, but its truths are incontrovertible, and must be right.—*C. R. Bree, Stowmarket.*

Peat as a Top Dressing for Gravelly Soil.—In 1842 I planted a ten-acre field of this soil with Potatoes, and after the Potatoes were gathered in November, I gave a part of it a covering of about three inches deep of raw Moss, and over that again a slight sprinkling of land. Last year it was sown with Barley, and laid down with Clover and Rye-grass; the Barley was lodging in the part that got the covering of Moss, while the Barley in the other part of the field would hardly bend to the sickle at shearing time. This year the Hay is lodging where the Moss was put on, while in the other part of the field there is but a poor thin covering.—*A. C.*

Ox-eye Daisy.—Having observed a paragraph from "A Subscriber," requesting to be informed of a method of getting rid of the Ox-eye Daisy, I beg to state that in a field in my possession that had recently been laid down for permanent pasture, the Ox-eye Daisy sprung up in a part of it so thickly as to exclude other vegetation. The weed was mowed down when in flower, and the field was close fed by sheep for the ensuing year, when the Ox-eye Daisy entirely disappeared.—*A. C. L.*

Phenomenon.—In a field of Rye-grass and Red Clover now nearly fit for the scythe, we have observed more than once, at mid-day, a thin vapour arise on the windward side, and gradually spread over the whole surface, measuring 22 acres; and at the distance of half a mile, it appeared like the smoke of a large brick-kiln, and to parties near, quite a thin vapour. Now, the wind was light, and the day perfectly serene and beautiful. It travels along with the current of air, but there certainly was no appearance of disturbance in the air: and, what appears strange, it is confined to one field. The soil is a rich loam, and in a very dry state, having had no rain and but little dew for many weeks.—*W. D.*

[May this not be owing to the disturbance of the herbage by a gust of wind, which would raise, here and there, in the form of a vapour, the pollen of the ripe and dry Grass?]

Turnip-seed.—One man is born with a silver spoon in his mouth, another with a wooden ladle. Some of your happy correspondents, by soaking their Turnip-seed in Linseed-oil, and drying it in flowers of sulphur, have for years escaped the fly. I diligently soaked my Swede-seed this year in Linseed-oil for 48 hours, rubbing it repeatedly to impregnate every seed. I endeavoured to dry it with powdered sulphur, rubbing it diligently with more and more sulphur for five days together, until it was dry. I drilled it thick enough to please Mr. Morton, so that it comes up like Mustard and Cress; but the Turnip-flies seem as if they were a body of yeomanry called out this month, and they dress by the Turnip-rows exactly, and there is not a seed-leaf (such exact discipline do they keep) which is not perforated by them like a sieve, bating the numerous instances in which they have eaten up the entire cotyledon. Wishing all other farmers better success in the experiment, I am, &c.—*W. P., Taunton.*

Mare and Foal.—Not seeing any answer in your Paper to your correspondent's question respecting a "mare and foal," I send the following:—Tie the mare up in a stable when the foal is to be admitted to her, and let a man stand behind her armed with a broomstick (a suitable broomstick—a switch or whip will not do), and when the mare offers to bite or kick the foal, let it be applied to the fleshy parts of the hind quarters. There is great virtue in a broomstick, but it all depends upon its being well applied, and with right good will. I have made a very savage mare take her foal in this way. Let your correspondent observe, I much prefer gentle measures, and only recommend the broomstick in extreme cases, where all such have failed. I have no doubt, though I never had occasion to try it, that a foal might be brought up on cow's milk from a bottle, as used by shepherds for lambs, till it was old enough to drink it from a pail, taking care not to give the milk too cold. —*D., an Old Dragoon.*

Bran.—In answer to H. Lawson's request, I beg to refer him to page 108 of Sir H. Davy's "Agricultural Chemistry," where the constituents of 100 parts of ashes of bran are said to be—

Soluble salts . . .	44.16
Earthy phosphates . .	46.8
Silica	.5
Metallic oxides . .	.25
Loss	8.59
	100.00

H. S., Bedhampton. [Another correspondent, "C. J." refers us to Dr. Ure's "Dictionary of Arts and Manufactures," under the word Bran. Saussure found bran to contain a large proportion of inorganic matter, almost identical with that of Wheat; viz., very rich in potash and the phosphates.]

Farmyard Manure.—It is now known to most farmers that, when cattle are full-grown, nearly all the mineral ingredients of the soil are returned with the droppings—the soluble salts in the urine and the insoluble with the solid excrements. Because we find certain mineral substances contained in all plants in definite proportions, we may conclude that these are absolutely necessary for their vigorous growth. It is, therefore, easy to understand how farmyard manure supplies the crops with food, as it contains it in the proportions required by them. Of what importance must it not be carefully to preserve this manure! In its natural state, however, it contains ingredients which, if left to themselves, are dissipated in the air, thus occasioning loss to the farmer. How are these ingredients to be preserved, and what are they? They are nitrogenous substances, that is to say, they contain that element—Nitrogen—which enters so largely into the composition of the plant, and serves to form the most nutritious portion of it. They are contained in two forms—as urea, and carbonate of ammonia. The urea, as such, cannot serve as food to the plant, and is only of use when converted into a salt of ammonia. Now it so happens that such a change takes place when urine is left to itself; and a compound is formed—carbonate of ammonia—which can serve directly as nutriment. The only objection to it is its volatility; and we must endeavour to put it into an un

objectionable shape, so that it may easily be taken up and decomposed by the plant, without being volatile. This may be done in two ways—either by decomposing the carbonate of ammonia by means of a stronger acid, such as oil of vitriol (sulphuric acid), or spirits of salt (muriatic acid), and dispelling the carbonic acid, or by a double decomposition, whereby we fix both the ammonia and the carbonic acid. The latter is effected by sulphate of lime (gypsum), or muriate of lime, which decompose the carbonate of ammonia and form sulphate or muriate of ammonia and carbonate of lime (chalk). This decomposition only takes place when the agent (gypsum or muriate of lime) is dissolved in water; for which reason muriate of lime is preferable to gypsum, because it is soluble in its own weight of water, whilst the latter requires 350 parts of water to dissolve it. I presume, now, that all those farmers who read the *Agricultural Gazette* are acquainted with the value of the urine of cattle. Supposing the farmer has his tank, the best method of effectually preserving the ammonia of the urine, and of removing the smell from the stables and cowsheds, is to strew the floor, behind the cattle, with a sprinkling of gypsum every day. When this plan is first adopted, it is best to water the gypsum with a watering-pot, after having strewn it on the floor; as I have said that the action of it on the carbonate of ammonia does not take place till it is dissolved. If the farmer wishes to remove the smell from his stables, he will be obliged to wash the walls with a solution of gypsum, or better, with a solution of muriate of lime, and afterwards with pure water, for the walls in an ill-ventilated stable are covered with a solution of ammonia in water. In preparing the farmyard heap, it should be a rule with the farmer to heap it on as small a space and as compact as possible. The ground on which it is to lie should either be bricked or should consist of a very stiff clay, and should be about half a foot below the surrounding ground, and should be situated at the lowest part of the farmyard. By means of pipes the floor is connected with the tank, so that all the urine and water may run off. A layer of gypsum is now to be spread on the flooring, and the heap is to be commenced by covering the whole bottom, with the exception of about half a foot on every side. On every foot-height of manure a layer of gypsum is to be spread, sufficiently thick to appear white. When the heap is completed, or before, the contents of the tank are to be poured on by degrees, in quantity sufficient to wet the heap well, but so that not much will run back into the tank. By these means the following advantages will be obtained:—1st. The cartage of it in water-carts will be rendered unnecessary, and some labour saved. 2d. The gypsum of the farmyard heap will be dissolved; and, 3d, by the addition and evaporation of the water of the urine, the decay of the farmyard manure will be facilitated. To the question, How should farmyard manure be applied? I answer: If the soils are light, the farm-yard manure cannot be too much decayed, provided proper precautions be taken to preserve all its useful ingredients by the means already stated. The farmer will, in this case, do well only to place as much on his land as will suffice for the nutriment of one crop, because a large portion of it will be washed beyond the reach of the roots of the plants by the falling rains. If the soils are heavy, it will be better to plough your farm-yard manure under, in as recent a state as possible, again providing it has been properly preserved; the fermentation of the Straw may tend to lighten the soil in such a case. If the manure is to serve immediately as food to the plant, it must be decayed; if, on the contrary, it is to act slowly, it should be fresh; as to the time when it should be placed on land, farmers are much at variance. For pastures it should be spread after the first mowing of the Grass—if possible on a rainy day—and should be as much decayed as possible. It will then act as quickly as guano. For arable land it will much depend upon the state of the soil and upon the nature of the crops. I may, however, be allowed to add, that it is a downright absurdity to lead out unprepared farm-yard manure on a hot day, and to leave it for any length of time in heaps on the soil. This I have seen scores of times; the loss which takes place is nigh incalculable. We have hitherto spoken of pure farm-yard manure; we must now make some remarks on the farmyard manure of most agriculturists. It is a common practice to collect the weeds of the soil and to spread them on the dungheap. Farmers seem not to be aware that whilst they destroy one individual plant they may sow again at least a hundred, if the weeds are in seed. Now this is frequently the case, although many say that seeds are killed on the dunghill. This idea is fallacious; some seeds may be killed, but most are not. Many wonder at the numberless weeds that constantly reappear on fields that have been carefully weeded, and yet they seek not the cause so near home, forgetting that they sow the seeds themselves. I have known farmers who allowed that seeds were not killed on the dunghill, and resorted to the worse system of adding lime to the dunghill. It is true that the seeds were killed, but at the expense of the ammonia and the organic matter. Far better mix the weeds with caustic lime, to burn them, which amounts to the same. Another practice is to place the Potato stalks on the dunghill, without any precaution as to whether they are again conveyed to the field they grew upon or not. This is not immaterial when the farmer recollects that these stalks contain a most necessary ingredient of the stalks of grain. It is owing to the frequent removal of these stalks that land is so very impoverished, inasmuch as the haulm of grain are scarcely able to support themselves. If these stalks are placed on the dunghill, it is necessary to use that part of the heap on which they have been put, as manure for the land from which they have been taken. I have only one remark more to make, which appears to be of great importance. I have known gentlemen who have bought up the manure collected by poor people, and who have manured meadows with it. The consequence has been, in two cases which have come under my more immediate notice, that the Grass has almost been totally extirpated by numerous weeds. They were not able to give any reason for this change, but only told me whence they had bought their manure. It was chiefly the manure of horses, which had been fed on the highroads, or on weeds collected from different parts. The weeds must have been in seed, and have passed unchanged through the stomach of the horse, germinated, and sprung up in the soil. There can scarcely be a farmer who has not, on some occasions, found a few solitary grains of corn growing in the dung of horses. Having seen this myself, I endeavoured to find out whether small seeds were killed by passing through the body of a horse. For this purpose I fed an old horse with weeds in seed, collected its dung, and mixed it with soil in which I believe there were no seeds of any kind. The box which I filled with this mixture was, after eight days, filled with weeds, which, after the lapse of a few weeks, I was able to recognise as the same species as those on which the animal had been fed. Here, then, I found a key to the mystery. This must be the case constantly in a weak horse and in an old horse. It is not without good grounds that sheep are said to improve pasture lands, as the process of digestion in them seems to be more powerful and complete than in horses, at least old ones. May it not be the case with most old animals? I conclude with this, and merely add that I should be glad to hear of any communication to this effect.—*Albert J. Bernays.*

Drainage.—Would you have the kindness to inform me whether charred branches of trees can be advantageously employed, as well as drain-pipes, in draining heavy land? My hedge-rows would furnish me with an abundance of loppings fit for charring, and I should be glad to so employ them. As charcoal is almost impenetrable, I should think this might answer, at least for a good many years.—*Thomas Holmes.* [Your suggestion is, we think, new; loppings of trees and hedges have long been employed as material for filling drains, which, so filled, act efficiently, though not permanently. If they were charred superficially (not thoroughly, lest, being brittle, they should break into small fragments when being placed in the drain), they would be equally suitable for this purpose, and they would have, in addition, the important character of permanence conferred upon them.]

Rooks.—That the food of this bird is various in its nature I know from undeniable facts; early in this spring I had two rooks brought to me that had been killed on a field of spring Wheat, and the craws contained Wheat only, with the usual accompaniment of gravel; but it is the Potato crop that suffers most in this country. That the rook is also of great use to the farmer must, I think, also be true, as he is constantly seen on fresh ploughed land, and often on Grass fields, where only insects can be met with. The balance of good or injury that the bird does can only be estimated by conjecture, without a close examination into the birds' usual habits. But I am inclined to think, notwithstanding the injury done to the Potato crop—notwithstanding these birds being graminivorous must consume very much Corn—yet, that if their food was not more abundantly composed of insects, that from their immense numbers, the crops both of Corn and Potatoes would be totally destroyed, instead of partially injured.—Δ. [This is, we think, the fair conclusion to be derived from this discussion, which, in the absence of any fresh facts on the subject, we must now bring to a close.]

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND

AT a weekly Council held at the Society's house in Hanover-square on Wednesday last, the 10th of July, present, His Grace the Duke of Richmond, K.G., in the chair, Lord Bridport, Hon. George Agar, Hon. Geo. H. Cavendish, M.P., R. Archbold, Esq., M.P., C. H. Baldock, Esq., D. Barclay, Esq., M.P., T. R. Barker, Esq., J. R. Barker, Esq., J. Benett, Esq., M.P., H. Blackett, Esq., W. R. Browne, Esq., F. Burke, Esq., Dr. Calvert, Rev. Thos. Cator, Col. Challoner, F. C. Cherry, Esq., L. Cooke, Esq., G. Cottam, Esq., J. Dean, Esq., J. E. Denison, Esq., M.P., R. Etwall, Esq., M.P., H. Gibbs, Esq., J. B. Glegg, Esq., Col. Henderson (Mayor of Southampton), E. Holland, Esq., Sir John V. B. Johnstone, Bart., M.P., T. Jones, Esq., J. Kinder, Esq., J. Marmont, Esq., Col. MacDouall, E. Parkins, Esq., E. W. W. Pendarves, Esq., M.P., E. S. C. Pole, Esq., H. Price, Esq., J. Roddam, Esq., J. Scales, Esq., Prof. Sewell, J. V. Shelley, Esq., R. A. Slaney, Esq., T. H. B. Sotheron, Esq., M.P., W. B. Stopford, Esq., and T. Tweed, Esq., the following new Members were elected:—

Quicke, Rev. Andrew, Winchester.
Withers, Rev. Edward, Phillimore Place, Kensington.
Bull, Alban, Hanwell, Banbury, Oxon.
Vivian, Lord, Glynn, Lostwithiel, Cornwall.
Bourne, Henry Titus, Alford, Lincolnshire.
Templemore, Lord, Dunroby Park, Co. Wexford, Ireland.
Sewell, Robt. Burleigh, Newport, Isle of Wight.
Dickinson, Edmund Henry, Kingweston, Somersetshire.
Henderson, Richard, Langley Ford, Wooler, Northumberland.
Reed, Thos., Warksworth Barns, Alnwick, Northumberland.
Pink, Richard, Hambledon, Horndean, Hants.
Pink, Charles, Hambledon, Horndean, Hants.
Winnington, Sir Thomas, Bart., Stanford Court, Worcester.
Chapman, Thos. Sands, Aston Clinton, Tring, Herts.
Pain, George, Salisbury.
James, Charles, Stratford, Salisbury.
Aitchison, Capt R., Bartley Manor House, Eling, Southampton.
Bird, J. A. Park Cottage, Brixton, Surrey.

The names of twenty-three candidates for election at the next meeting were then read.

PIPE-TILE MACHINE.—Mr. Cottam, of Winsley Street, Oxford Street, favoured the Council with a report on the latest improvements effected in the Benenden Machine of Mr. Hatcher for the production of cylindric draining tiles. This machine in its present state consists of a framework supported on wheels: one-third of its length being appropriated to the platform of the machine for the manufacture of the tiles, and the remainder to the apparatus of the endless web for supporting the pipes as they are formed, and conveying them to the hands of the boys stationed to receive them. On a level with this endless web, and between two upright posts, is placed a square iron box, which forms the bottom of the machine. It is open at the top and at that side in its front which adjoins the endless web. This box is always full of clay, the iron grating which acts the part of a sieve or screener of the clay being placed on the top of the box, and the required dies, or plates of iron, with apertures for the shape of tile required, secured in front. On this box thus arranged, is placed a cylinder filled with clay from the pug-mill, and the piston being inserted, and forced down steadily by means of a winch working a couple of toothed wheels, the clay is driven under great pressure through the iron grating into the square box, and thence out of the box, through the apertures which constitute the pattern-dies of the tiles, which, as they issue continuously from the machine, are conveyed along the endless web set in simultaneous motion with the piston by a connection with the same winch and a couple of rollers. As one cylinder becomes emptied another is ready to replace it. A boy is stationed at each side of the endless web, and measures off the tiles, piling them alongside the machine, which as the work proceeds is moved from time to time forward, out of the way, by means of the wheels on which it is supported. Mr. Cottam explained to the Council the various improvements effected in the action of the piston, the insertion of the die-plates, the material best adapted for the endless web, and the mode adopted for keeping it in proper tension, the apparatus for measuring and cutting off the tiles, the advantages possessed by the cylindric shape of the tiles for arranging them, both for the purpose of drying and burning equably, the rate of charge for labour, fuel, &c., the number of tiles produced per day, &c. &c. He submitted to the inspection of the Council a model of the machine, and one of the cutters for measuring off the tiles. This apparatus Mr. Cottam described as one of the most ingenious and efficient contrivances he had ever met with for accomplishing its purpose by the most simple means. Previously to its use, the tiles were cut off by a wire without measurement; the consequence of which was, that they were not only of unequal length, but injured by the pressure of the hands on their sides on being conveyed away from the machine. It consists of a wooden roller, secured firmly by a screw at one end to a plate of iron; to this iron plate an iron bar is secured, which runs parallel three or four inches above the roller, and serves the purpose of a handle for the boy, as well as a support for the cutting-wire, which moves in a frame and socket up and down in front of the roller. The boy takes the apparatus by the handle, and inserts the roller inside the pipe-tiling up to its hilt at the iron plate; he then draws the cutting-wire, when the pipe-tile is perfectly severed, and remains loose on the roller, from which he at once allows it to glide off into its proper place, without injury or loss of time. Mr. Cottam stated that the cost of the machine complete would be 25*l.*; and for the inspection of such members of the Society as felt an interest in the subject, he had made arrangements at his manufactory in Winsley-street (opposite the Pantheon, in Oxford-street), to have the machine at work daily from 12 to 3 o'clock. Assuming one man, one youth, and two boys to be employed at the machine (including pug work), with one man at the kiln, and the price of coals to be 25*s.* per ton, the following results would be obtained by calculation from the data laid by Mr. Cottam before the Council on this occasion:—

Diameter of Tiles.	Number that can be made in a day of 10 hours.	Cost per Thousand.
1 inch.	11,000	4*s.* 6*d.*
1½ inch.	8,000	5*s.* 6*d.*
1¾ inch.	5,800	6*s.* 0*d.*
2 inches.	4,000	7*s.* 3*d.*
2½ inches.	3,200	8*s.* 6*d.*

Mr. Denison, M.P., remarked that when it was taken into consideration how many points there were in the new system of tile-making which this machine would affect in reference to the cost of production, it could not be doubted that in the progress of the experience to be gained it would be found, that in the less amount of clay required, the consequent reduction in fuel for burning, and the local advantage of coals to be obtained in so many parts of the kingdom at a less rate than that of 25*s.*, as assumed in the present inquiry, there would be every reason to believe that tiles might be made by means of this machine at a still lower cost even than that which was at present deducible from the facts laid before the Council.

Mr. Denison then proceeded to give the Council an interesting narrative of the history of the ingenious inventor of the present tile-machine; and as he had liberally given up (at the patriotic suggestion of his patron, Mr. Law Hodges) all patent right in reference to its manufacture—a privilege probably equivalent to a premium of no

less than 3000*l.*—he trusted that all members of the Society who intended to purchase the machine would obtain it at head-quarters, of the inventor's accredited agents, Messrs. Cottam and Hallen, both in reference to his own peculiar claims on the consideration of the promoters of agricultural improvement, and to the desirableness that no parties should experience disappointment by the purchase and employment of an inferior machine: he thought such a choice in their selection would not only be fair to the inventor, but a slight return to him in remuneration for the benefits he will have conferred on those persons who are so unfortunate as to have land which requires draining.

The Duke of Richmond then proposed the best thanks of the Council to be given to Mr. Cottam for his kindness in explaining to the members the construction of this machine; which were carried unanimously.

Southampton Meeting.—The Mayor of Southampton has communicated to the Society the rates at which it has been determined to limit the prices for lodgings at Southampton during the ensuing meeting: on which occasion no beds would be charged more than half-a-guinea per night under any circumstances, while others would range at prices considerably lower according to situation and condition. Every facility would be given to promote the comfort of the numerous visitors expected on that occasion.

(To be continued.)

HIGHLAND AND AGRICULTURAL SOCIETY.

The half-yearly meeting was held on Tuesday last; the Earl of Leven in the chair. After electing 110 new members, the secretary gave in the Report on the premiums offered by the Directors for this year from the funds left to their disposal by the general meeting in January. Among the new premiums, 100*l.* is offered for experiments with special manures, separately, or mixed in certain proportions, and on the effect of such manures on the succeeding crops of the rotation; for reports of experiments on various descriptions of food—as Carrot, Beet, Potatoes, Beans, Oats, Barley, and Oil-cake, afforded to grazing and fattening stock and to dairy cows—50*l.* for an analytical examination of the grain of Oat, as affected or modified by soil, manure, climate, or variety of seed, intended as a commencement of a series of premiums for analyses of the cultivated grains of the country; 50*l.* for an illustration, by chemical analysis, of sound and healthy plants of different varieties of the Potato, of the cause of the disease which has of late years affected that valuable root.—Sir John Hope reported on the Veterinary College, which he said had been most successful, and, as a proof, in last April, 41 students had qualified and passed their examinations. Besides those in Scotland many students had come from different parts of England and Ireland. The Professor had lately told him that since the commencement of the College upwards of 700 students had attended his lectures.—Sir John Graham Dalyell reported from the committee on machinery, that at their last meeting they had awarded three medals—two silver medals for improvements in the internal economy of farm-yards, and a gold medal to Lord James Hay, for the great trouble and expense incurred by him in devising the manufacture of his concrete drain tiles, and laying the plan before the Society.—Mr. Miller, Forrest, moved that the Society should use its influence to have the markets for grain throughout the country reported in a uniform manner; almost every market at present reported their sales by different measures, which rendered it a matter of extreme difficulty to strike an average among them.—Thanks were voted to the Earl of Leven and Melville; after which the meeting adjourned.—*Edinburgh Paper.*

AGRICULTURAL CHEMISTRY ASSOCIATION.

The usual half-yearly general meeting of the subscribers to the Agricultural Chemistry Association was held on Monday in the Museum of the Highland and Agricultural Society. Lord Dunfermline in the chair. The Secretary, Mr. Coventry, read the half-yearly Report, extracts from which we shall publish next week.

CIRENCESTER AGRICULTURAL COLLEGE.

On Monday last a meeting of those interested in this institution was held at Cirencester, Earl Bathurst in the chair, to report the progress of the committee in the establishment of the College. The Report will be found in another column, and will be read with lively satisfaction by the friends of the undertaking. The Society has now resolved itself into a tangible shape, and will immediately commence operations. Port Farm, within one mile of Cirencester, the property of the Right Hon. Earl Bathurst, and in the present occupation of Mr. Stevens, has been fixed upon as the site for the example farm. Mr. Sotheron, in proposing the first resolution, observed, that about six months ago he first heard of this college, and he then thought it of so speculative a nature that it would never have been carried into effect. He had, however, been now entirely brought to the opinion that it was likely to be practically useful to all classes of agriculturists. The main point in this undertaking was to obtain a good system of management by gentlemen who would not go through their duties in a hurried manner, but would allow no detail to be carried out without their sanction, by rules and meetings. He had ventured to make these remarks, as he had lately taken some part in the formation of an institution, which resembled the present in many respects—the Marlborough Proprietary College. He had there seen what errors they might have fallen into during the last years, had they not had a gentleman to conduct it who was well conversant with his duties, and by whose exertions they had been enabled to keep their expenditure within the limits of their income. This had convinced him of the necessity of a good system, which could only be achieved by placing men of business at the head of their affairs.—Mr. A. Fewster, in moving the fourth resolution, said that it would hardly have been deemed possible that any person could have been found to oppose so desirable an object as this, though experience proved the contrary. One objection he had heard was that it would train up young persons to be sort of dandy farmers, whom landlords would not be very much inclined to have as tenants, and indeed if they did, they would get no rent out of them. Another thought the establishment of this college a dangerous matter, as tradesmen's sons and other young persons would be so well instructed as to drive "us old codgers out of the market." These two objections he thought entirely destroyed each other. It was preposterous to believe that a person should be unable to cultivate the soil because his mind was cultivated. He was acquainted with the projectors of this college, and knew their object to be to establish, not a theoretical institution, but one based on a sound practical foundation. He gave agriculturists credit, as a class, for being fully as industrious as any class of the community, though at the same time he must own there was a great lack of intelligence amongst them. And why should not agriculturists receive as good education as any other class of the community? It would be productive of advantage to the higher classes, because the landlord would reap the benefit of a skilful application of a larger amount of capital on his land. The farmer, however, will be a greater gainer still by the college—it would be the means of imparting a purer and more healthy tone of moral feeling amongst his children. It was gratifying to notice what a change had taken place in this respect since he had first attended market, a period of 30 years. Formerly the conversation at the market ordinaries was calculated to produce anything but a good effect in the minds of those who partook in it. At present, however, the conversation turns on the improvement of stock, and the better cultivation of their farms, to advance which latter object was the intent of this Society. Farmers would thereby be brought into more immediate contact than they generally are, and would be enabled to combine science with practice. The moral advantages, too, would not be confined to this class alone, but would also extend to the industrious labouring classes. The improvements in the cultivation of the farms produced by this College, with the means resulting therefrom, would be such that there would be a very large increase in the number of labourers employed in the cultivation of the soil at the present time; and what effect would this produce on the manufacturers and the home market!

FARMERS' CLUBS.

Debenham.—The subject of discussion on June 28th, 1844, was the Drainage of Arable Pasture Lands. The member who introduced it said he would merely state to the Club the manner in which he drained his farm, which has a flat surface, and a subsoil which he might call a clay, only he could not dig a rod without either meeting with a vein of sand or gravel. He preferred drawing the drains obliquely instead of in the direction of the furrows. He found eight or nine yards from drain to drain sufficiently close; he opened the drains with the plough as deep as possible, then followed with the broad and draining spades, to the depth of 22 inches; he thought ling the best material to put in the drain, but on account of its distance he is obliged to use straw, haulm, bushes, &c. Where straw is used he would put it into the drain loose, not twisted; he would, of course prefer tiles, but they ought to be found by the landlord. For pasture land he had tried the mole or draining-plough, but on his description of land he found it perfectly useless. He had also ploughed out a deep furrow with the common plough, and then used the narrow or draining-spade only; this he did not approve of; he thought it best to pursue the same plan for pasture as he did for arable land, excepting that he made his drains at distances of 11 yards, which laid his pastures sufficiently dry.—Another member said he considered draining in this district of the greatest importance; it was almost useless to manure the land unless it was first thoroughly and efficiently drained. He occupies a farm with a very stiff subsoil, and therefore opens his drains only six yards apart; he also prefers his drains in an oblique direction, instead of following the track of the ridges; thinks the drain cannot well be made too deep; it ought not to be of less depth than 32 or 34 inches. He has purchased Furze for filling in the drains; finds four score faggots sufficient for one acre, costing on the heath 2*s.* per score. He has also used the plashings of borders, ditches, &c., for filling in the drains; considers there are several objects gained by so doing;—First, employ is found for an extra labourer, straw or haulm, which would otherwise be used, is saved for manure, and the borders, banks, &c., are freed from Brambles, rubbish, &c. He is of opinion that great attention should be paid to the filling in of the earth turned out of the drain; the clay drawn by the narrow or draining-spade should be carefully placed upon the shoulders and well stamped down before the other mould is put into the drain; he lays a pipe about 12 inches long, and compressed at one end, in the eye of each drain, to keep out rats, rabbits, &c. His pastures having also a strong subsoil, he has drained the greater part at distances of five yards, and one piece which immediately abuts upon his homestead, every four yards, with the mole or draining-plough, at a depth of 24 inches.—A third member, whose farm was different from the two preceding members', his land being much more hilly, the subsoil on the hills being very stiff, while towards the bottom it was much lighter, thinks five yards apart quite sufficient on strong lands; thinks ling better than Furze; next to draining-tiles would use picked stones, could sufficient be obtained; drains ought to be 32 inches deep; draws his drains obliquely across the slope of the lands. For pasture land, if drained by hand, thinks nine yards from drain to drain sufficiently near.—It was ultimately resolved, that in draining arable land the spade is decidedly preferable to the mole-plough; that the nature of the subsoil must determine the distance between the drains; that while on stiff or strong clay lands five to six yards may be a sufficient distance, on loose-bottomed *gaulty* soils there may be a distance of seven or eight yards from drain to drain; that 30 or 32 inches is the proper depth for a drain. Tile-draining is most desirable on tender or springy soils, but it being a permanent improvement the tiles should be furnished by the landlord. That the mole or draining-plough is the best for pasture land.—*W. G., Hon. Sec.*

Reviews.

The History, Structure, Economy, and Diseases of the Sheep. By W. C. Spooner, V. S., &c. Cradock and Co., 48, Paternoster Row. 8vo. Pp. 456.

[Our readers will recognise this title, as that of a volume from which we have already been permitted to make several instructive extracts. See pp. 322, 416, *Ag. Gazette.*]

"This work is divided into three Parts. The first, which embraces the history or description of the breeds of sheep, is arranged somewhat according to the plan adopted by Professor Low in his large work on the Breeds of Cattle and Sheep; and the author has availed himself of this work in the account of the various races of sheep found in the northern part of the Island; whilst he has relied principally on his own knowledge for the description of the more southern breeds. The most important portion of the anatomical division of the work has been the result of careful dissection; and for the section on Feeding, Fatting, and Breeding, the author alone is responsible. In the third Part, on the Diseases of Sheep, free use has been made of the various papers contributed to the 'Veterinarian,' &c."

The above, extracted from its Preface, is accurately descriptive of this work. The name of Mr. Spooner, who is a distinguished member of his profession, is a sufficient guarantee for the accuracy and usefulness of its contents. Let us extract from the chapters on Feeding and Fatting, which he informs us are more particularly his own, the following, as a specimen of the style in which this section of the work has been executed:—

"The various points in the form of a sheep, connected with the aptitude to fatten, have received the utmost attention from practical and sagacious breeders, although some of these points are still matters of dispute. The superiority of particular improved breeds is now generally acknowledged, and may indeed be considered to be established on certain principles, though in arriving at these principles it must be confessed that we are little indebted to science, but to the long and attentive observation and correct reasoning of sagacious and practical men. It is, indeed, only very lately that anything like a correct explanation could be offered for the various phenomena that attend the fattening of animals, or why one description of food should be more suitable for the purpose than another. It had, indeed, been laid down as a fact, that a large capacious chest and lungs were necessary for the production of fat, and that its secretion depended in a great degree on the quantity of air that could be respired; whilst the researches of modern chemists have shown that nothing could be further from the truth. And now that the fallacy has been exposed by chemistry it can also be readily shown by anatomy, for we find that whilst the horse and the camel have eighteen ribs, the ox and the sheep have only thirteen. The absence of these five pair of ribs must of course materially diminish the cavity of the chest, and its greater breadth (necessary for another purpose) does not by any means compensate for its diminished length. Animals of speed have rarely a propensity to fatten, but in greyhounds, hares, foxes, deer, &c. we find the chest is long and deep, though not wide, whilst in pigs, sheep, and oxen we notice an opposite conformation. The fact is, in proportion to the activity of the animal is its respiration and its demand for oxygen, and in proportion to the consumption of oxygen is the wear and tear of the system and the consumption of the elements of the food. If the exertions are therefore excessive, that portion of the food that would have increased the weight of the body is called for to support respiration.

"In animals having a propensity to fatten, we find the chest of a circular form; the ribs spring from the spine more horizontally than in others, almost at right angles: this is observed in the ox, compared with the horse, and still more so in the sheep. The effect of this conformation is certainly in one respect to increase the width of the chest, but another important effect is to increase very considerably the size of the abdomen; for in order to obtain the greatest possible nutriment from the food, it is essential that the organs of digestion should be capacious, which cannot be the case unless the cavity in which they are situated is large."

This is a book which Farmers' Clubs ought to add to their libraries, and as a work of reference, it ought to be in the possession of all sheep-farmers. The first Part contains a great deal of very interesting reading, and, as well as the second and third Parts, which are likely to form the more *useful* portion of the volume, it is illustrated by good engravings.

Lectures on Agricultural Chemistry and Geology. By James F. W. Johnston, M.A., F.R.SS. L. & E. Reader in Chemistry and Mineralogy in the University of Durham, &c. William Blackwood and Sons, Edinburgh.

To enable one to write usefully on the subject of these Lectures, it is evident that the most intimate knowledge of chemical or geological science is not all that is necessary; an acquaintance with the practical details of farming is required by any one who would apply the doctrines of chemistry in the improvement of agriculture; and Professor Johnston, in his capacity of Chemist to the Agricultural Chemistry Association of Scotland, has enjoyed opportunities of becoming acquainted with correct agricultural management, better than perhaps ever before fell to the lot of any scientific man. The consequence is, that while his writings will doubtless for a long time to come be an authoritative standard to which all questions about the bearings of chemistry on agriculture will be referred, both they and his Lectures have a practical and most useful tendency.

In Scotland the efforts of Professor Johnston during the past year, in diffusing a knowledge of the relations of chemical science to the practice of the farmer, have been extraordinarily successful. Some of the immediate results of his agency on behalf of the Agricultural Chemistry Association will be found in the Report in another column, of the late half-yearly meeting of that Society; but perhaps as much benefit will ultimately arise from the spirit which he has aroused in agricultural districts, by which the connexion of science and farming being duly appreciated, a desire for scientific information has been excited. The existence of this desire is proved by the establishment of no fewer than seven or eight agricultural periodicals in Scotland within the last year.

We mention all these as the effects of Professor Johnston's teaching in Scotland, to show the value to agriculture generally, of a systematic work on Agricultural Chemistry and Geology, by one so thoroughly qualified to write on these subjects. But we must also select for this purpose some extracts from these Lectures.

The following remarks are on the action of lime as manure:—

"The changes, therefore, which lime and organic matter, supposed to be free from nitrogen, respectively undergo, and their mutual action in the soil, may be summed up as follows:—

"1. The organic matter, under the influence of air and moisture, spontaneously decomposes, and besides carbonic acid which escapes, forms also other acid substances which linger in the soil.

"2. With these acids the quick-lime combines, and either by its union with them or with carbonic acid from the air, soon (comparatively) loses its caustic state.

"3. The production of acid substances by the oxidation of the organic matter goes on more rapidly under the disposing influence of the lime, whether caustic or carbonated. These acids combine with the lime, liberating from it, when in the state of carbonate, a slow but constant current of carbonic acid, upon which plants at least partly live.

"4. The organic acid matter which thus unites with the lime continues itself to be acted upon by the air and water, aided by heat and light—itself passes through a succession of stages of decomposition, at each of which it gives off water or carbonic acid, retaining still its hold of the lime, till at last, being wholly decomposed, it leaves the lime again in the state of carbonate ready to begin anew the same round of change.

"During this series of progressive decompositions, certain more soluble compounds of lime are formed, by which plants are in part at least supplied with this earth, and which with the aid of the rains carry off both lime and organic matter from the soil. And again, the more rapid the production of the acid substances which result from the union of the organic matter with oxygen, the more abundant in general also the production of those gaseous and volatile compounds which they form by uniting with hydrogen, so that, in promoting the formation of the one class of bodies, lime also favours the evolution of the other in greater abundance, and thus in a double measure contributes to the exhaustion of the soil.

"The disposing action of lime to this twin form of decomposition few varieties of organic matter can resist, and hence arises the well-known efficacy of lime in resolving and rendering useful the apparently inert vegetable substances that not unfrequently exist in the soil.

"*Of the Comparative Utility of Burned and Unburned Lime.*—Is there no advantage, then, you may ask, in using caustic or burned rather than carbonate or unburned lime? If the ultimate effects of both upon the land be the same, why be at the expense of burning? Among other benefits may be enumerated the following:—

"1. By burning and slaking, the lime is reduced to the state of an impalpable powder, finer than could be obtained by any available method of crushing. It can in consequence be diffused more uniformly through the soil, and hence a smaller quantity will produce an equal effect. This minute state of division also promotes in a wonderful degree the chemical action of the lime. In all cases chemical action takes place between exceedingly minute particles of matter, and among solid substances the more rapidly, the finer the powder to which they can be reduced. Thus a mass of iron or lead slowly rusts or tarnishes in the air; but if the mass of either metal be reduced to the state of an impalpable powder—which can be done by certain chemical means—it will take fire when simply exposed to the air at the ordinary temperature, and will burn till it is entirely converted into oxide. By mere mechanical division the apparent action of the oxygen of the air upon metals is augmented and hastened in this extraordinary degree, and a similar result follows when lime in an impalpable state is brought into contact with the vegetable matter upon which it is intended to act.

"2. The effect of burned lime is more powerful and more immediate than that of unburned lime in the form of chalk, marl, or shell sand. Hence it sooner neutralises the acids which exist in the soil, and sooner causes that decomposition of vegetable matter of every kind to commence, upon which its efficacy, in a great degree, depends. Hence, when it can easily be procured, it is better fitted for sour Grass or arable lands, for such as contain an excess of vegetable matter, and especially for such as abound in that dead or inert form of organic matter which requires a stronger stimulus—the presence of more powerful chemical affinities, that is—to bring it into active decomposition. In such cases, the lime has already done much good before it has been brought into the mild state, and remaining afterwards in this state in the soil, it still serves, in a great measure, the same slower after-purposes, as the original addition of carbonate would have done.

"3. Besides, if any portion of it, after the lapse of two or three years, still linger in the caustic state it will continue to provoke more rapid changes among the organic substances in the soil, than mild lime alone could have done.

"4. Further, quick-lime is soluble in water, and hence every shower that falls and sinks into the soil carries with it a portion of lime, so long as any of it remains in the caustic state. It thus reaches acid matters that lie beneath the surface, and alters and ameliorates even the subsoil itself.

"5. It is not a small additional recommendation of quick-lime, that by burning it loses about 44 per cent. of its weight, thus enabling nearly twice the quantity to be conveyed from place to place at the same cost of transport. This not only causes a direct saving of money—as when the burned chalk of Antrim is carried by sea to the Ayrshire coasts—but an additional saving of labour also upon the farm, where the number of hands and horses is often barely sufficient for the necessary work."

The remark in the last paragraph of this extract from Prof. Johnston's Lectures, demonstrates that attention to the practical bearings of his subject, of which we have been speaking, no less than the other portions of it evidence his scientific ability. We shall return more than once to the consideration of selections from this work, which must for many years be a text-book on the subjects of which it treats.

Miscellaneous.

Statistics of Tile-draining in Ayrshire.—Tile draining as a system was commenced in this county about twenty years ago. At that period a great many farmers were very averse to it; so much so, that otherwise intelligent men would not consent to give it a fair trial. One great objection regarded the durability of the tile, and the improbability of the water getting down to the drain; all hesitation on these scores, if properly manufactured and judiciously laid, have been completely set aside: and to show how thoroughly the agricultural interest have become persuaded of the immense advantage of the system, it need only be stated that there are beyond fifty Tile-works in Ayrshire alone! These will produce on an average thirty millions of tiles yearly—a quantity capable of draining not less than 12,396 imperial acres, allowing a distance of eighteen feet between the drains, and the tiles one foot long. The number of acres in Ayrshire is 793,600, and suppose one fourth to be incapable of amelioration, there will still remain 595,200 of improvable land. At the present rate of tile-making, taking it for granted that the whole will be used, and deducting 150 millions as the manufacture of previous years, it would require nearly 43 years to complete the drainage of the county. The price of thirty millions of tiles, at 25*s.* per 1000, would be 37,500*l.* The quantity of coal consumed will be about 15,000 tons, and the number of men and boys employed in making them not less than 1200. Thirty millions of tiles, one foot in length, will lay 1,621,621 falls of drains, 18½ feet to the fall, or nearly 6000 miles. Supposing the average cost of cutting, laying, and filling the drains to be 4*d.* per fall, the total would amount to 27,027*l.*, and calculating a labourer's wages at 10*s.* per week, for sixteen weeks in the year, the usual period of draining in this county, it follows that employment is given to 3378 men—a matter of no small moment, especially at a season when other out-door work is not to be had. Granting that 150,000,000 of tiles have been laid prior to this date, 61,980 imperial acres will necessarily have been drained. Take the produce before the land is subjected to this process at six bolls, and now at ten, per acre—a medium average—the increase over former years will be 247,920 bolls, or 123,960 quarters. Carrying the calculation a little farther, suppose that equal enterprise is displayed during the next ten years—and there is every probability that it will far exceed it, should no political shock affect the encouragement of home agriculture—the stimulus given to the productive capabilities of the soil will be still more strikingly apparent. Ten years' draining at 12,396 acres yearly, will give a total of 123,960, or an increase at the previous average of 247,920 quarters of grain, thus showing an augmentation in the means of existence of 66 per cent., while it is well known that the gross increase of the population in any previous period of ten years has not much exceeded 15 per cent. The above calculation of produce, &c., is of course limited to the county of Ayr; and, great as the benefits are which it exhibits, how much greater would they be in a national point of view were the naturally rich lands of England and Ireland subjected to a similar process!—*R. Boyle, Esq., in Ayrshire Agriculturist.*

Laughable Mistake.—A carrier, in the neighbourhood of Bolton, recently had to convey a barrel of Roman cement to a gentleman, and a barrel of guano to a farmer, each of which he delivered to the wrong party. A plasterer commenced preparing the guano, which was given to him as Roman cement; and, after much difficulty, owing to the bad smell, he succeeded in plastering a few yards of the gentleman's house; but, the stench becoming past his endurance, he called out to the gentleman, and said, "I am very sorry, but I must beg of you to get some other person to finish this job, for I never met with such Roman cement before. I am quite sick, and the smell will poison me if I go on; besides, did you ever see Roman cement so yellow?" The gentleman said there must be some mistake, for it evidently was not cement, and accompanied the plasterer to the carrier's, where they found the farmer complaining about the barrel of stuff he had got. It was like sand; but when mixed with water it turned into stone, and would flag his field instead of making the Grass grow almost as quick as winking, as he was told this new manure would do. His man had mixed water with some of it, and spread it out; and, on returning a short time afterwards, he found the stuff as hard as a flag, and came to him in breathless haste, saying, "Mestur, I nevvur seed sitch stuff i aw my loife as yon, for I mixt sum on't wi weytur, un its turned into a flag."—"O!" exclaimed the plasterer, "that must be the Roman cement, and I have been mixing up your guano instead of it."—*Bolton Free Press.*

Notices to Correspondents.

ADHESIVE LAND.—*Villager.*—You may safely use the sand, of which you sent a specimen, in the manner you propose. With respect to your light land, pond mud and clay, previously mixed with lime, are likely to be beneficial applications.

ALPACA.—*E. R.*—Thanks for your correction; the passage was quoted from another paper. The ordinary route from Peru is, of course, round Cape Horn.

BRAN.—*F. S.*—Thank you. You will see in our Home Correspondence that your information has been anticipated.

COMMON MELILOT.—*A. B.*—Your specimen is Trefolium melilotus officinalis. It is useful as food for horses, sheep, &c., but is inferior in this respect to another species of the same plant, the Sicilian Melilot, or long-rooted Clover. See Hort. Gram. Woburnensis.

DAIRY VESSELS.—*M. Q.*—We have made inquiries on the subject of your question, and shall soon be able to give you the result.

FAILURE IN CLOVER.—*W. C.*—This may be remedied if the weather and soil be suitable, by sowing Italian Rye-grass over the bare spots immediately after harvest. It would be too late, we think, for Clover.

GRASS.—*Landlord.*—Your specimen is Anthoxanthum odoratum, or sweet-scented vernal Grass, of which Mr. Sinclair gives the following character in his Hort. Gram. Woburnensis:—"This Grass constitutes a part of the herbage of pasture on almost every kind of soil, though it only attains to perfection in those that are deep and moist. The chief property that gives merit to this Grass is its early growth. It is a true permanent pasture Grass. It does not appear to be particularly liked by cattle." The latter math is more valuable for grazing than the first crop. It is said to give new-mown hay its odour.

HIGHWAYS—GATES.—*A Constant Reader.*—Such gates as those mentioned by our correspondent are usually falgates, which are so hung as to shut of themselves; and we think that persons wilfully leaving them open would be answerable for damage thereby occasioned. They appear to be, in fact, the fences of the parties by or for whom they were erected, subject to the easement enjoyed by the public of passing through them, and the public must so use the right as not to injure other parties.—*W.*

HOPS.—*A. R. C.*—Sow the seed in March in a south border; keep them for a year in the seed-bed, and then prick them out a foot apart. They require protection for the first winter, as they are tender when young. The seed should be obtained from a female which has been purposely intertwined with a male, so that the flowers may come in contact. We have sent your note to *Ruricola.*

SAWDUST.—*Serra.*—See Mr. Parke's communication on the manufacture of peat charcoal, in a previous Number of this Paper. His suggestions there may be useful to you.

SULPHURIC ACID.—*Carl.*—You will find that the rest of your letter was inserted and answered amongst the Home Correspondence of last week. Use acid diluted with five weights of water; sprinkle it over each layer of manure in the heap, at the rate of 30 lbs. of acid to 5 cwt. of *excrement*, with whatever quantity of litter you may consider that to be mixed in your manure.

VALUE OF ROOTS.—*Querist.*—For the ordinary purposes of feeding sheep and oxen, we consider 20 tons of Swedes, 19 tons of Carrots, and 24 tons of Mangold Wurzel, each at the period when it is best as food, to be equal in value. For particular purposes, however, they differ in value. Thus Mangold Wurzel given to cows does not taint their milk—Swedes do; Carrots, again, are peculiarly valuable as food for horses. Ferns may be destroyed by perseverance in cutting them off as soon as they appear. Their existence in Grass indicates light, sandy, soft land.

***As usual, many communications have been received too late.

Markets.

HOPS, FRIDAY, July 12.

THE accounts from the blighted districts continues to come daily worse, and many Planters say they are past recovery in many places. Midd. Kent continues free from vermin, but mould is on the increase. The market is more active, and speculators buying freely.

PATTENDEN & SMITH, Hop-Factors.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, July 12.

Prime Meadow Hay	90s	to 98s	Clover -	100s to 130s	Straw - 28s to 34s
Inferior ,,	80	85			

JOHN COOPER, Salesman.

CUMBERLAND MARKET, July 11.

Superior Old Hay	100s	to 105s	Superior Clover	120s	to 128s	Straw 30s to 36s
Inferior -	88	94	Inferior ,,	100	110	
New Hay -	75	90	New Clover	90	100	

JOSHUA BAKER, Hay Salesman.

WHITECHAPEL, July 12.

Old Hay -	80s	to 98s	Old Clover	110s	130s	Straw - 30s to 36s
New Hay -	75	80	New Clover	80	100	

Trade very dull at the above prices.

SMITHFIELD, Monday, July 8.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s	10 to 4s 0
Best Short Horns	3	6	3	8	Best Long-wools	3	8 3 10
Second quality Beasts	3	0	3	4	Ewes and second quality	3	4 3 8
Calves	3	8	4	2	Lambs	4	0 4 8
Pigs	3	4	4	0			

Beasts, 2940; Sheep and Lambs, 31,930; Calves, 174; Pigs, 375.

We have to-day a larger supply of Beasts, but a very great many are of inferior quality; in consequence, the best are readily bought, and do not suffer much abatement in price from last Monday, although the numbers have some effect upon it; some of the most selling Scots, &c., have made 4s 2d, and Short horns 4s 0d, but the greater part of good quality realise very little, if any, over 4s for the former description, and 3s 8d the latter; the middling qualities are a very heavy sale, and several remain unsold. Our numbers of Sheep and Lambs continue large, but we notice good Sheep are not very plentiful; the best qualities are little dearer; there is also rather more demand for the middling qualities since the late rains; 4s 2d for Downs, &c., 4s for Longwools, although realised in some instances, cannot be quoted as general prices. The best Lamb is making a little more money, but a large proportion of the supply of this article is also very inferior, and very difficult to dispose of. Veal-trade is rather brisker. In Pork, no alteration.

Friday, July 12.

The Beef-trade to-day is very dull, at a little less money; the top prices for best Scots, &c., being 4s, and Short-horns, 3s 8d. The Mutton-trade is rather heavy, at the same prices as on Monday; Downs, &c. 4s, and Longwools 3s 10d, Ewes, &c. 3s 4d to 3s 8d. There is a slight improvement in the Lamb-trade, some of the most selling qualities have made 5s, but the general price of good Lamb is from 4s 4d to 4s 8d. Veal-trade is a little better, prices ranging from 3s 8d to 4s 4d. Pork, 3s 4d to 4s. Although there is a shorter market generally, there is fully sufficient to meet the demand.

Beasts, 630; Sheep and Lambs, 10,010; Calves, 451; Pigs, 320.

41, West Smithfield.

WOOL.—British, Friday, July 12.

	per lb.				per lb.		
Long-wooled Wethers	11½d	to 1s	0½	Southdown Hoggitts	1s 0½	to 1s	2½
Do. Hoggitts	1s 1	1	3	Kent Fleeces	1	1	1 2
Southdown Fleeces	11½	1	1½				

James Perrin, Wool Broker.

COVENT GARDEN, July 13.—The market has been well supplied with Fruit during the week, but Vegetables have been scarce, and generally inferior in quality. Trade remains nearly the same. Pine-apples are equally good and plentiful as they were last week, as are also Peaches and Nectarines, both of which are excellent in quality. Among the former we remarked some particularly fine specimens of Royal George, which are offered at nearly the same prices as last week. Grapes are sufficient for the demand. Some fine Melons are likewise in the market, at about the same prices as last week. Cherries are very abundant, and are a little reduced in price since our last report. Of Strawberries there are plenty, excellent in quality; the chief varieties are Keen's Seedling and Myatt's British Queen. There are also abundance of ripe Gooseberries and Currants, which have not altered in price since our last report. Vegetables are, for the most part, offered at nearly the same prices as last week, except Cauliflowers, which are a little dearer. Cabbages remain about the same, as do likewise Peas, Turnips, Carrots, &c., but French Beans are a little dearer. Potatoes are good and plentiful. Asparagus is nearly over for a season; a few bundles, however, are still in the market. Vegetable Marrow is nearly the same as last week; and no alteration has taken place in the price of Leeks. Lettuces and other salading are plentiful. Cut Flowers chiefly consist of Erica ampullacea, Erythrina crista galli, Ceanothus azureus, Carnations and Picotees, Verbenas, Heliotropes, Pelargoniums, Gardenias, Fuchsias, Lilies, Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb., 4s to 8s
Hothouse Grapes, per lb., 2s to 6s
Melons, each, 3s to 6s
Peaches, per dozen, 6s to 12s
Cherries, Wall, per lb., 1s to 2s
— Standards, per doz., 1s to 3s
Currants, per half-sieve, 2s to 5s
Strawberries, per gallon, 6d to 2s
Gooseberries, per hf.-sieve, 1s to 3s
Walnuts, pickling, per bsh., 3s 6d to 5s
Oranges, per dozen, 1s to 2s 6d
— per 100, 6s to 16s
Lemons, per dozen, 1s to 2s
— per 100, 6s to 14s
Almonds, per peck, 6s to 7s
Sweet Almonds, per lb., 2s 6d to 3s
Nuts, Barcelona, 20s to 24s
— Cob, 14s

VEGETABLES.

Cabbages, per dozen, 6d to 1s 6d
Cauliflowers, per doz., 2s to 5s
Sorrel, per hf.-sieve, 6d to 9d
Artichokes, per doz., 2s to 4s
French Beans, per hf.-sieve, 2s to 3s
Potatoes, old, per ton, 50s to 80s
— per cwt., 2s 6d to 4s
— per bushel, 1s 6d to 3s
— Kidney, p. bush., 2s 6d
— New, per cwt., 3s to 8s
— per half-sieve, 1s 6d to 5s
New Turnips, per bunch, 3d to 6d
Peas, per bushel sieve, 1s 6d to 3s 6d
Red Beet, per doz., 1s to 6s
New Carrots, 4d to 1s
Basil, per bunch, 4d to 6d
Horse Radish, per bundle, 2s to 3s
Savory, per bunch, 3d to 6d
Cucumbers, each, 4d to 1s 6d
Vegetable Marrow, per doz., 1s to 2s
Spinach, per sieve, 1s 6d to 3s
Leeks, per doz. bun., 3s to 4s
Garlic, per lb., 6d to 8d
Onions, per bunch, 2d to 10d
— large, per bushel, 1s to 3s
Shallots, per lb., 4d to 8d
— Green, per bunch, 3d to 4d
Lettuce, per score, 6d to 2s
Celery, per bunch, 6d to 1s 3d
Mushrooms, per pottle, 2s to 3s 6d
Small Salads, per punnet, 2d to 3d
Watercress, p. 12 sm. bun. 3d to 6d
Parsley, per hf.-sieve, 1s to 1s 6d
Tarragon, Green, per bunch, 3d to 4d
Green Mint, per bunch, 2d to 4d
Marjoram, per bunch, 4d to 6d
Chervil, per punnet, 2d to 3d

MARK-LANE, Monday, July 8.

We had a fair supply of English Wheat at Market this morning, which met a slow sale at a decline of fully 1s. per qr. from this day se'nnight; the transactions in Free Foreign were very limited, and the few retail sales effected brought last week's prices.—The Barley is exceedingly heavy, and must be noted 1s. lower.—Beans and Peas have each declined 1s. per qr.—There is a large show of Oats on the Market, and to effect sales, a reduction of 1s per qr. must be submitted to.

Friday, July 12.

The arrivals of Wheat, both English and Foreign, since Monday, have been moderate, and the trade continues dull at that day's quotations.—There is scarcely any business in Barley, Beans, or Peas, and their value is nominally the same.—Having a large supply of Oats, the Dealers are disposed to refrain from buying for the present, and sales can only be effected to a limited extent, at a further reduction.

Kingsford and Lay.

Patronised and sanctioned by HER MAJESTY THE QUEEN, H.R.H. Prince Albert, the Royal Family, and the several Sovereigns and Courts of Europe.

ROWLAND'S MACASSAR OIL, for the Growth and for Preserving and Beautifying the Human Hair. Price 3s. 6d.; 7s.; Family Bottles (equal to four small), 10s. 6d., and double that size, 21s.

Caution.—The words "Rowland's Macassar Oil" are engraved on the Wrapper of each genuine bottle; and on the back of the Wrapper 1500 times, containing 29,028 letters. Without this "None are genuine."

Rowland's Kalydor for Improving and Beautifying the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle, duty included.

Rowland's Odonto, or Pearl Dentifrice renders the Teeth beautifully white, and preserves the Gums. Price 2s. 9d. per box, duty included.

Caution.—Spurious imitations are frequently offered for sale as the Real Articles. It is therefore necessary on purchasing to see that the word "ROWLAND'S" is on the Wrapper of each. For the protection of the Public from fraud and imposition, the Honourable Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus—

A. ROWLAND & SON, 20, HATTON GARDEN; which is affixed on the KALYDOR and ODONTO. Sold by them and by all Chemists and Perfumers.

*** All others are FRAUDULENT COUNTERFEITS!!!

A LUXURY FOR WARM OR WET WEATHER.

BERDOE'S SUPERIOR LIGHT SUMMER FROCKS, Waterproof. A variety of the above, in new and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with true economy, and ultimate satisfaction.—W. Berdoe, Tailor, Waterproofer, &c., 69, Cornhill (north side).

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe's Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars-road, is still making the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, at 5s. 6d. each, or 3l. per dozen. Early in July A. P. will make the Milk-Pans of green glass of excellent quality, at 42s. per dozen.

PARR'S LIFE PILLS,

THE BEST MEDICINE IN THE WORLD, are now established as the only *certain* cure of disease in the human frame. Sufficient has already been advertised in the public prints to convince any reasonable person that the efficacy of this Medicine is unbounded, and that every disease will soon vanish from the effects of this popular remedy. Already the Proprietors have received and published 26 different sheets of Testimonials; and, besides, have received some thousands of letters confirming all the statements published, and proving the immense benefit derived by all classes by taking Parr's Life Pills. Testimonials are received daily, and it would be impossible in a newspaper to publish one-half received; and the following are selected as people well known in their respective neighbourhoods, and whose testimony is unquestionable. Further sheets of Testimonials may be had, gratis, of all Agents.

IMPORTANT TESTIMONY of an old man in his 77th year, received by Messrs. Mottershead and Co., Manchester, and forwarded to the Proprietors of Parr's Life Pills.

I, THOMAS BARLOW, gratefully testify to the great benefit I have derived by taking Parr's Life Pills. I had been out of health for many years; sometimes unable to work, and on the sick club. I had a bad complaint at the stomach, with a violent cough, and at various times was under different medical men, including the noted Dr. Newbold of the Choriton Dispensary; but my case seemed hopeless, as they none of them could cure, or give me much relief, and I had no hopes left of being better on this side the grave; however, quite unexpected, the deliverer came at last (Old Parr's Recipe). I got a box of his Pills, and found immediate benefit from the first box, and continued them for several months with increased good until this time, and now I feel myself wonderfully well, and am strong in body, have a good appetite, and though in my 77th year, I am able to get my own living, in the employ of Mr. Mee, farmer, Withington (as a farm labourer). I am satisfied that my recovery is to be ascribed entirely to the restorative qualities of Parr's Life Pills; and as a proof of my great age, subjoined is a copy of my baptismal register.

BAPTISM, 1767.—Thomas, son of James and Martha Barlow, of Hale, Cheshire, was Baptised the 27th day of November, in the year of our Lord 1767.
From the Parish Register—F. BOWDON.
Signed—JOHN BALDWIN, Vicar.

CAUTION TO THE PUBLIC.

*** Beware of Spurious Imitations of the above Medicine. None are genuine unless the words "Parr's Life Pills," are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the facsimile of the signature of the Proprietors, "T. ROBERTS and Co., Crane Court, Fleet-street, London," on the directions. Sold in boxes, at 1s. 1½d., 2s. 9d., and family packets, 11s. each.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES OF EUCLID, with Enunciations. Price 1s. 6d.

London: Whittaker and Co.: sold by all Booksellers.

PRINTED FOR
TAYLOR AND WALTON,
Booksellers and Publishers to University College,
UPPER GOWER-STREET.

DARLEY'S
SCIENTIFIC LIBRARY,
FOR THE USE OF
SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A New Edition (being the fifth) *is now in the Press,*

A SYSTEM
OF
POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

By GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

II.

New Edition (just published),

COMPANION
TO THE
POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

By GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

III.

Third Edition,

A SYSTEM
OF
POPULAR ALGEBRA;

WITH
A Section on PROPORTIONS and PROGRESSIONS.

By GEORGE DARLEY, A.B.

Price 4s. 6d.

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

Second Edition,

A SYSTEM
OF
POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

By GEORGE DARLEY, A.B.

Price 3s. 6d., cloth.

V.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B.

With Engravings.—12mo, 4s., cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

WORKS PRINTED FOR

TAYLOR AND WALTON,

28, UPPER GOWER STREET.

LIEBIG'S CHEMICAL LETTERS.

Second Edition, fcp. 8vo, 4s. 6d. cloth,

FAMILIAR LETTERS ON CHEMISTRY: AND ITS RELATIONS TO COMMERCE, PHYSIOLOGY, AND AGRICULTURE. By JUSTUS LIEBIG, M. D., Professor of Chemistry in the University of Giessen. Edited by JOHN GARDNER, M. D, Member of the Chemical Society.

"That the public will discover its merits, and that it will find its way into the drawing-room as well as the library, and be equally prized by the advanced man of science and the student, we venture to say is certain; and it must increase the respect entertained for Chemistry wherever it is read."—*Chemical Gaz.*

LIEBIG'S AGRICULTURAL CHEMISTRY.

Third Edition, considerably enlarged and improved. 8vo. 10s. 6d., cloth,

CHEMISTRY IN ITS APPLICATIONS TO AGRICULTURE AND PHYSIOLOGY. By JUSTUS LIEBIG, M.D., PH. D., F.R.S., Professor of Chemistry in the University of Giessen. Edited, from the Manuscript of the Author, by Lyon Playfair, Ph. D.

"— a book infinitely superior to its predecessors, and, to a very considerable extent, unlike them."—*Gardeners' Chronicle.*

LIEBIG'S ANIMAL CHEMISTRY.

Second Edition, 1 vol., 8vo, 9s. 6d., cloth,

ANIMAL CHEMISTRY, OR CHEMISTRY IN ITS APPLICATIONS TO PHYSIOLOGY AND PATHOLOGY. By JUSTUS LIEBIG, M.D, Ph. D., Professor of Chemistry in the University of Giessen. Edited, from the Author's Manuscript, by William Gregory, M. D., Professor of Chemistry in the University of Edinburgh.

"While we have given but a very imperfect sketch of this original and profound work, we have endeavoured to convey to the reader some notion of the rich store of interesting matter which it contains. The chemist, the physiologist, the medical man, and the agriculturist, will all find in this volume many new ideas and many useful practical remarks. It is the first specimen of what modern Organic Chemistry is capable of doing for Physiology; and we have no doubt that from its appearance, Physiology will date a new era in her advance."—*Quarterly Review*, No. 139.

TURNER'S CHEMISTRY, by LIEBIG & GREGORY.

One Volume, 8vo, 11. 8s.

TURNER'S ELEMENTS OF CHEMISTRY. Seventh Edition. Edited by JUSTUS LIEBIG, M.D., Ph.D., F.R.S., &c. Professor of Chemistry in the University of Giessen; and WILLIAM GREGORY, M. D., Professor of Chemistry in the University of Edinburgh.

"— as a compendium of the present state of Chemistry, and a text-book for all beginners, we consider it as unequalled by any in the English language, and we even doubt whether there are any of the foreign manuals of an equal size which can venture to compete with it."—*Chemical Gazette*, Dec. 1, 1842.

PORTRAIT OF PROFESSOR LIEBIC,

OF GIESSEN. A fine Engraving by Rauch, after a Drawing by Trautschold. Price 7s. 6d.

"This is an admirable likeness of Professor Liebig."—*Lancet.*

CHEMISTRY APPLIED TO THE ARTS.

Now Publishing,

APPLIED CHEMISTRY; IN MANUFACTURES, ARTS, & DOMESTIC ECONOMY. Edited by E. A. PARNELL, Author of "Elements of Chemical Analysis." With numerous Wood Engravings and other Illustrations.

The First Volume, bound in cloth, price 13s., contains INTRODUCTION, GAS ILLUMINATION, PRESERVATION OF WOOD, DYEING and CALICO PRINTING. The Article on Dyeing and Calico Printing is illustrated by specimens of printed Cottons.

Part 6—MANUFACTURE OF GLASS, Part 7—GLASS and STARCH. Part 8—TANNING. Part 9—TANNING, CAOUTCHOUC, BORAX, and SOAP.—Part 10. SOAP, SULPHUR, and SULPHURIC ACID.

*** *Parts VI. to X. each 2s.*

CHEMICAL ANALYSIS.

One Volume, 8vo, with Numerous Diagrams, 10s. 6d., cloth.

ELEMENTS OF CHEMICAL ANALYSIS, INORGANIC and ORGANIC. By EDWARD ANDREW PARNELL, late Chemical Assistant in University College, London.

"As an adjunct to the exertions of the teacher, but by no means superseding the necessity of oral and practical instruction, the work of Mr. Parnell appears likely to be in the highest degree useful; it will serve to convey to the attentive student a correct notion of the general routine of operations proper to each of the different classes of analytical research, and the principles upon which such modes of proceeding have been devised, besides affording him a fund of practical detail, an easy reference to which will certainly lighten his labours and accelerate his progress."—*Chemical Gazette*, Nov. 1, 1842.

NEW WORK ON ALKALIMETRY, &c.

In One Volume, 12mo, price 4s.

NEW METHODS OF ALKALIMETRY, AND OF DETERMINING THE COMMERCIAL VALUE OF ACIDS AND MANGANESE. By Drs. FRESENIUS and WILL, Chemical Assistants in the University of Giessen. Edited by J. Lloyd Bullock, late of the Giessen and Paris Laboratories.

This little work will prove of the highest importance to Calico Printers, Bleachers, Dyers, Manufacturers of Soap, Paper, and Prussiate of Potash; also to Chemists, and to Dealers in Alkalies, Acids, &c.

APPLICATION OF LIEBIG'S PHYSIOLOGY.

In 8vo, 6s.

AN APPLICATION OF PROFESSOR LIEBIG'S PHYSIOLOGY TO THE PREVENTION AND CURE OF GRAVEL, CALCULUS, and GOUT. By H. BENCE JONES, M.D., Cantab; Licentiate of the Royal College of Physicians, London; and Fellow of the Chemical Society.

LINDLEY'S ELEMENTS OF BOTANY.

8vo, with many hundred figures on wood, 10s. 6d.

ELEMENTS OF BOTANY, STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, and MEDICAL; being a Fourth Edition of the Outline of the first principles of Botany. By JOHN LINDLEY, Ph. D., Professor of Botany in University College, London.

"This work is indeed what the author intended it to be, 'A Complete Botanical Note Book, wherein all the principal topics which the teachers of Botany introduce into their lectures, are arranged methodically.' The necessity for such works, as pegs for fixing facts in the memory, and giving them their full value on their application to reasoning processes, is undeniable; and between the skill of the author and that of the engraver, it is scarcely possible to present elementary notices on a simpler and more available plan. One consequence of this is, the impossibility of further analysis. Our readers must therefore rest contented with a reference to the work itself."—*Athenæum.*

KNIGHT'S WEEKLY VOLUME.

This day,

THE ENGLISHWOMAN IN EGYPT; Letters written during a Residence in Cairo, in 1843 and 1844, with E. W. Lane, Esq., Author of "The Modern Egyptians." By his Sister. Volume One.

London: CHARLES KNIGHT and Co., 22, Ludgate-street.

Price Sixpence, free by post.

The Railway Chronicle

Of SATURDAY last, JULY 6, contains

THE GOVERNMENT BILL.—PROCEEDINGS of the DEPUTATIONS, with the Resolutions—On COMPULSORY REGULATIONS for the CONVEYANCE of THIRD-CLASS PASSENGERS—NEW STANDING ORDERS—GOVERNMENT APPROPRIATION.

REPORTS OF RAILWAY MEETINGS—Lancaster and Carlisle—Guildford Junction.

PROJECTED LINES—Leeds and Dewsbury—Fen Railways.

NEW LINES—Ashton and Stalybridge and Sheffield and Manchester.

FRENCH RAILWAYS—Report of Proceedings in the Chamber of Deputies.

CORRESPONDENCE—Scarborough Line—Entrance to London from the North—Great Northern Lines—Great Southern and Western Irish—Amiens and Boulogne—Mr. Stephenson and Mr. Wilkinson.

PARLIAMENTARY AND LEGAL PROCEEDINGS.

VALUE OF SHARES.—Returns from London, Liverpool, Manchester, Leeds, York, Hull, Glasgow, and Paris, with Comments on the respective Markets.

MECHANICAL IMPROVEMENTS—Railway Springs (*with four Engravings*).

RAILWAY LITERATURE.—Memorandum on Railway Fares.

Order The Railway Chronicle of any Newsvender.

CONTENTS of the NUMBER for SATURDAY last, JULY 6, OF

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.

Twenty-four Large Quarto Pages, PRICE FOURPENCE,

Or Stamped, to go free by post, 5d.

REVIEWS OF, WITH EXTRACTS FROM—

Correspondence of the Right. Hon. E. Burke, edited by the Earl Fitzwilliam and General Sir R. Bourke.

Poetry of Common Life, with a Preface by the late Dr. Arnold.

Memoirs of a Babylonian Princess.

The Dark Ages, by the Rev. S. R. Maitland.

Memoir of the Conquistador Bernal Diaz, being an account of the Conquest of Mexico.

The Industrial Resources of Ireland, by Dr. Kane.

ORIGINAL PAPERS.—The Song of Summer, by Frances Browne—Poets' Corner and Poets' Funerals, Interment of Thomas Campbell.

OUR WEEKLY GOSSIP.—Dr. Wolff's Progress—Sir Percy Shelley and Mr. Leigh Hunt—Mr. Kemble's Readings—New Panorama, Ruins of Baalbec—Horticultural Fête—Miniature of Milton—The Statue of the Duke of Wellington—Picture of Gaudenzio Ferrari—Musical Gossip.

SOCIETIES.—Reports of Geological—Astronomical (Telescopic appearance of the moon).

FINE ARTS.—Exhibition at Westminster Hall, the Frescoes and Sculptures.

MUSIC AND DRAMA.—Her Majesty's Theatre (Moriani—Zelie)—Concerts, Exeter Hall (St. Paul)—Royal Academy of Music, the appointment of a Professor of Declamation—M. Döhler's Concert—Princess's Theatre (Miss Austin)—Sadler's Wells.

MISCELLANEA.—Paris Academy of Sciences—The Moa or gigantic Bird of New Zealand—Rock Tombs—Volcanic v. Lunar Theory.

Order The Athenæum of any Bookseller or Newsman.

WITH THE APPROVAL OF THE LORDS COMMISSIONERS OF HER MAJESTY'S TREASURY.

COMPLETION OF THE ZOOLOGY OF THE BEAGLE.

Just Completed in 5 Vols., bound in cloth, or in half Morocco or Russia, at a small addition to the Price,

THE ZOOLOGY OF THE VOYAGE OF H.M.S. BEAGLE, under the Command of Captain FitzRoy, R.N., during the years 1832 to 1836. Edited and Superintended by CHARLES DARWIN, M.A.F.R.S. V.P.G.S., Naturalist to the Expedition. Comprising highly-finished representations of the most novel and interesting objects in Natural History, collected during the Voyage of the Beagle, with descriptive Letterpress, and an account of the habits and ranges.

Contents of the Volumes.—FOSSIL MAMMALIA, by Richard Owen, Esq., F.R.S. Plain Plates, 1*l.* 14*s.* MAMMALIA, by R. Waterhouse, Esq. Coloured, 2*l.* 2*s.* BIRDS, by John Gould, Esq., F.L.S. Coloured, 3*l.* FISH, by the Rev. Leonard Jenyns, M.A., F.R.S. Plain Plates, 1*l.* 18*s.* REPTILES, by Thomas Bell, Esq., F.R.S., F.L.S. Plain Plates, 1*l.* 2*s.* Each Volume is complete in itself, and may be had separately.

GEOLOGICAL OBSERVATIONS made during the Voyage of the Beagle, in Three Parts. By CHARLES DARWIN, M.A. F.R.S. V.P.G.S.

Just Published in 1 Vol. 8vo., Price 15*s.* cloth,

PART I.—ON THE STRUCTURE AND DISTRIBUTION OF CORAL REEFS.

PART II.—ON THE VOLCANIC ISLANDS OF THE ATLANTIC AND PACIFIC OCEANS.

(Together with a brief Notice of the Geology of the Cape of Good Hope and of Part of Australia.)

Preparing for Publication,

PART III.—ON THE GEOLOGY OF SOUTH AMERICA.

London: SMITH, ELDER and Co., 65, Cornhill.

MARTIN CHUZZLEWIT COMPLETE.

On the 16th inst., in One Volume Octavo, price, bound in cloth, 21*s.*; half-bound, morocco, 1*l.* 4*s.* 6*d.*; whole-bound, morocco gilt, 1*l.* 6*s.* 6*d.*

THE LIFE and ADVENTURES of MARTIN CHUZZLEWIT. By CHARLES DICKENS. With 40 Illustrations by "Phiz."

CHAPMAN and HALL, 186, Strand.

FOR OUT-OF-DOORS NATURALISTS.

Just Published, price 1*s.*, No. 19, of

THE ZOOLOGIST: a Popular Monthly Journal of Natural History, conducted by EDWARD NEWMAN, F.L.S. and Z.S., containing facts and anecdotes of animals, (after the manner of 'White's Selborne.') The following distinguished naturalists have already enriched 'The Zoologist' with their contributions:—Sir Oswald Mosley, Bart., Professor Bell, Rev. W. T. Bree, and Messrs. Couch, Doubleday, Gosse, Gray, Salmon, Stephens, Waterton, Waterhouse, and Yarrell.

JOHN VAN VOORST, 1, Paternoster Row.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, (Instituted in 1805), New Bridge-street, Blackfriars.

BONUS every THREE Years. Eighty per cent. or Four-fifths of the Profits returned on Policies effected after the 1st of May, 1844.

The new Prospectus, containing a full detail of the highly advantageous Terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

EDWIN CHARLTON, Secretary.

FELIX SUMMERLY'S

Home Treasury of Books, Pictures, Toys, &c., purposed to Cultivate the Affections, Fancy, Imagination, and Taste of Children.

WORKS ALREADY PUBLISHED.

Name of the Work.	*No. of Pictures.*	*Plain.* s. d.	*Coloured.* s. d.

11. ALPHABET OF QUADRUPEDS, selected from the Works of Paul Potter, Karl du Jardin, Stoop, Teniers, Rembrandt, &c., drawn from Nature, with descriptions, *7s. 6d.*
12. LITTLE PAINTER'S PORTFOLIO; 14 Pictures by Giotto, S. del Piombo, Holbein, and Modern Artists, *7s. 6d.* clrd.
13. THE LITTLE PAINTER'S COLOUR-BOX, with Ten best Colours (including Cobalt, Lake, Indian Yellow), Slab, Brushes, Directions, and Specimens of Mixed Tints. *6s. 6d.*
14. TESSELLATED PASTIME, with a Book of Patterns. Single box, *6s.*; double box, *7s. 6d.*

*** 9, 10, 11 just published.

Works nearly ready.

15. ALBERT DURER'S BIBLE EVENTS. 3d Series	6	3 0	4 6
16. CINDERELLA (new edition, revised)	4	2 6	4 6

17. A CENTURY OF FABLES, from Æsop, Pilpay, Gay, La Fontaine, &c.; illustrated by the Old Masters.
18. BOX OF REAL TERRA COTTA BRICKS, Geometrically proportioned, with Plans and Elevations.

JOSEPH CUNDALL, 12, Old Bond-street.

ILLUSTRATED WORK ON BRITISH FERNS.

Just Published, in One Volume, 8vo., price 25*s.*, cloth lettered, (or in Three Parts, stitched, price 8*s.* each, for the convenience of those who prefer a different binding),

A HISTORY OF BRITISH FERNS, & ALLIED PLANTS, by EDWARD NEWMAN, Fellow of the Linnean and Botanical Societies.

This work is illustrated by 158 Engravings, which are carefully executed by some of our first artists, from the author's own drawings on the wood, and consist of studiously accurate figures of every species and variety of Fern found in Great Britain, together with magnified details of venation, fructification, &c., and sketches of the romantic scenery among which the author has found some of the rarer species. The letter-press describes with great care, but in a popular manner, the characteristics of each species; gives long lists of localities of all the rarer kinds; explains the synonyms used by continental and British authors; records the medical and other properties which Ferns are supposed to possess; and contains full particulars respecting the cultivation of these beautiful plants, both in the open air and in Mr. Ward's closely-glazed cases. The work is the result of many years of unremitting labour, and frequent journeys on foot in various parts of England, Wales, Scotland and Ireland, undertaken by the author with the view of observing in their natural stations, the plants he has described.

The Equisetaceæ, Lycopodiaceæ, &c. are included.

JOHN VAN VOORST, 1, Paternoster-row.

Now Publishing, Second Edition,

A PRACTICAL ESSAY and Rules for the Application of Guano, as a Manure for all Soils and Crops; its important use and results in the Greenhouse and Kitchen-Garden; the new mode of applying the same to Wheat-sowing, a great saving in seed and labour, crop earlier at maturity, an increase of grain and straw, at one-third less cost than bones or farm-yard manure. To be had of the Author only, by letters prepaid, inclosing 1*s.*; if to be posted and prepaid, 1*s.* 4*d.*, by letters post-paid, addressed J. H. SHEPPARD, Land Surveyor, City of Chester.

N.B. Also, by the same Author, price 8*d.* posted prepaid, a small TREATISE on LIQUID GUANO, GYPSUM, &c., for Raising and Transplanting of Swedes, with a certainty of a crop in dry seasons, and accompanied by extra produce of superior quality.—City of Chester, July 11, 1844.

12mo, price 9*s.* cloth,

A MANUAL OF BRITISH BOTANY; containing the Flowering Plants and Ferns, arranged according to the Natural Orders. By CHARLES C. BABINGTON, M.A., F.L.S., F.G.S.

"Mr. Babington's is a very valuable contribution to our knowledge of British plants, full of original observation and good critical remarks. It has also an excellent feature in marking in Italics those points in the specific characters to which attention is particularly demanded."—*Gardeners' Chronicle.*

JOHN VAN VOORST, 1, Paternoster-row.

Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

News of the Week.

THE Morocco War, which our Ministry a fortnight since were disposed to treat with something like indifference, has now assumed so important a character, that a squadron of line-of-battle ships has been ordered to assemble on the coast of Morocco, under the command of Sir Edward Owen, in order to watch the movements of the French fleet under the Prince de Joinville. The Danish, Swedish, and Norwegian Governments have also sent ships of war to the same quarter, and the Spanish Ministry are said to be contemplating an attack on Tangiers. The French, in the meantime, are pouring large bodies of troops into Algeria, and making immense preparations for a decisive struggle, if events should render it necessary to resort to extreme measures. The Emperor, according to the last accounts from Paris, has shown a disposition to comply with the demands of France, and has already dismissed or imprisoned the Moorish officers who had first ordered the violation of French territory. This fact is considered favourable, and it is hoped that the other demands of France, viz., that no collection of troops shall take place on the frontier, and that Abd-el-Kader shall be sent away from the country, will ultimately be granted. The French Government distinctly disavow all intention of extending their possessions in Africa, and repeat the assurance that their sole object is to obtain a just reparation and the security of their African territory.—From Spain we have further rumours of conspiracies in different parts of the country, but it is strongly suspected that they are caused by political hostility and with the view of exciting the people against the Progresista party. The prisons are filled with political prisoners, belonging chiefly to that party; and many of the provinces are in a state of great alarm, and apprehensive of approaching disturbances.—From Italy we learn that the insurgents who recently landed on the coast of Calabria have all been taken by the Neapolitan troops, and that the two sons of Admiral Bandiera, who had deserted the Austrian service and become the leaders of the movement, are among the number of the captured.—From the United States we learn that Congress has dissolved without coming to any decision on the Texas question, but an important announcement has been made by the Mexican Government to the effect that they will resist the project of annexation by every means in their power. No doubt is entertained at New York, that if the Senate had accepted President Tyler's proposals in regard to Texas, war would already have commenced between Mexico and the United States.

At home, the Revenue Returns, which were published on Saturday, present the same favourable results which have marked the Returns of several quarters past. The Customs have increased 835,349*l.* for the year, and 312,029*l.* for the quarter; the Excise have increased 420,073*l.* for the year, and 85,479*l.* for the quarter; while the Property-tax, though exhibiting a slight decrease on the quarter, gives an increase on the year of not less than 1,929,666*l.* The increase on the Post-office is still satisfactory, because it is certain and progressive; the increase on this branch for the year is 34,000*l.*, and for the quarter, 10,000*l.*—In Parliament, various important measures have been advanced with a rapidity characteristic of the late period of the Session. The Poor Law Amendment Bill has been under discussion in the Commons, but it has not excited so much interest as the Government Bill for the management of Railways, which will doubtless pass without modification, notwithstanding the powerful opposition it has met with from the railway companies. The Sudbury Disfranchisement Bill has also passed, together with the Bill for extending the *Qui-tam* Act, which is already so well known in sporting circles. Mr. Cowper's Bill for legalising the formation of Field Gardens in rural districts was read a second time on Wednesday, and was favourably received by both sides of the House.—The arguments in the Writ of Error, in the case of Mr. O'Connell and others, were brought to a close on Wednesday, and certain questions were submitted to the Judges on the points of law raised on behalf of the appellants. It was generally expected that judgment would have been given on Thursday, but the departure of the judges on their respective circuits, as soon as the arguments were concluded, rendered this impossible. Some days must elapse before their answers can be received, and the judgment of the House of Lords is consequently deferred for the present.

Home News.

COURT.—The Queen, accompanied by the Princess Royal, took an airing on Saturday afternoon in an open carriage, Prince Albert, and the equerries in waiting, accompanying Her Majesty on horseback. Her Majesty visited her Royal Highness the Princess Sophia at Kensington. The Queen and Prince Albert honoured the Italian Opera with their presence in the evening. On Sunday Her Majesty and the Prince attended divine service in the Chapel Royal of Buckingham Palace. On Monday the Queen and Prince Albert took their usual morning walk in the Palace Gardens, and in the afternoon Her Majesty took an airing in an open carriage and had a dinner party in the evening. On Tuesday the Queen and Prince took their usual walks in the Palace Gardens, and afterwards rode out in an open carriage. On Wednesday Her Majesty held a Privy Council, at which Lord Heytesbury was declared Lord Lieutenant of Ireland. In the afternoon of the same day Her Majesty and Prince Albert left Buckingham Palace for Windsor by the Great Western Railway. On Thursday the Queen and Prince took an airing in a pony phaeton.—The negotiations for the purchase of Norris Castle for Her Majesty are entirely broken off, and as Osborne House, from the confined nature of its accommodations, will be inadequate for Her Majesty to entertain the King of the French, who is expected to arrive in England in September, orders have been issued that the Pavilion at Brighton shall undergo the necessary preparations for the reception of the Court at that period.

The Duchess of Kent, attended by Lady A. M. Dawson and Sir G. Couper, embarked from Ostend on Wednesday in the Princess Alice steam-vessel, and arrived at Woolwich at half past 4 P.M., performing the passage in the short space of ten hours. Her Royal Highness appeared in excellent health. Sir F. Collier immediately proceeded on board the Princess Alice, and the Duchess of Kent and her attendants were landed from the barge of the William and Mary yacht. Her Royal Highness proceeded direct to the Paddington terminus of the Great Western Railway, and reached Windsor about half-past eight.

The King of Saxony.—On Sunday the King of Saxony, attended by his usual suite, visited Bristol, and proceeded to the Bath Hotel, Clifton. His Majesty, after attending divine service, proceeded to view the beauties of Clifton and St. Vincent's rocks. On Monday morning he inspected the steam-ship Great Britain, on board which his Majesty was received by the Mayor, Captain Claxton, R.N., &c., by whom his Majesty was conducted through every portion of the ship. The King expressed repeatedly his astonishment at her stupendous size, and the massive machinery with which she was fitted. His Majesty then proceeded to Leigh Court, the seat of Mr. P. J. Miles, which has been so often visited by royalty, where he viewed the gallery of paintings, and partook of a *déjeûner*. On Monday evening his Majesty left for Beachley and Tinterne Abbey, on his way to Wales, to view the Dowlais Ironworks, the property of Sir J. Guest.

The Revenue.—The returns of the Revenue for the year and quarter ending the 5th inst., were published on Saturday. The total income of the year is 50,220,678*l.*, the income of the quarter, 13,362,981*l.* On the year there has been an increase of 2,440,336*l.* The Customs show an increase of 835,349*l.*; Excise, 420,073*l.*; Stamps, 72,693*l.*; Taxes, 6387*l.*; Property Tax, 1,929,666*l.*; Post Office, 34,000*l.*; Crown Lands, 25,000*l.*; to which must be added Repayment of Advances, 386,120*l.*, making a total of 3,709,288*l.* There is a decrease of 1,154,401*l.* in Miscellaneous (caused chiefly by the absence of the remittances from China, which formerly swelled this item), and in Imprest and other Moneys, 114,551*l.*, making a total decrease of 1,268,952*l.* which being deducted from the total increase, gives, as above, an increase on the year of 2,440,336*l.*—On the *Quarter*, there is a decrease of 276,299*l.* The increase in the Customs is 312,029*l.*; Excise, 85,479*l.*; Stamps, 46,023*l.*; Taxes, 5043*l.*; Post Office, 10,000*l.*; to which must be added Repayments of Advances, 36,350*l.*; making a total increase of 494,924*l.* There is a decrease in Property Tax of 109,224*l.*; Crown Lands, 2500*l.*; Miscellaneous, 641,337*l.*; to which must be added Imprest and other Moneys, 18,162*l.*, making a total decrease of 761,223*l.*, from which, by deducting the increase of 494,924*l.*, we have, as above, a decrease on the quarter of 276,299*l.*

Parliamentary Movements.—There are three candi-

dates for the representation of Birmingham, vacant by the death of Mr. Scholefield :—the son of the deceased gentleman and Mr. Joseph Sturge having come forward on the Liberal interest, and Mr. Spooner on the Conservative interest.—Mr. Kelly, a pledged Repealer, has been elected member for the city of Limerick, vacant by the resignation of Sir D. Roche.

Legal Appointments.—The Queen has been pleased to appoint the following gentlemen to be of Her Majesty's counsel learned in the law—viz. Mr. J. Hodgson, Mr. C. S. Whitehurst, Mr. W. J. Alexander, Mr. R. C. Hildyard, and Mr. J. Parker. The following gentlemen have been appointed Serjeants-at-law :—Mr. E. Balfour, Mr. J. A. Kinslake, of the Western circuit, and Mr. C. Chadwick Jones, of the Home circuit.

Foreign.

FRANCE.—The differences between France and Morocco are daily assuming more importance, and from the immense preparations making in the French ports, it is impossible to predict the result. Large bodies of troops are pouring into Algeria, and the whole Opposition press are urging upon the Ministry that France ought to push her conquests into Morocco, and thereby lay a foundation for the destruction of British influence in the Mediterranean. The latest accounts from Algiers state that since the action of the 15th no encounter has taken place between the French troops and those of Morocco, and Abd-el-Kader and the Moorish Chiefs have retired with their troops several days' march beyond Ouchda. The Paris papers continue to publish every scrap of news from Africa likely to raise a feeling against England. The *Patrie* gives an undated letter from Tlemcen, in which it is stated, that at the moment when the French army was advancing from Mascara to Morocco, Abd-el-Kader received from Sidi Mahomed, the son of the Emperor of Morocco, a supply of 6000 English muskets, with instructions in Arabic and English how to use them. The letter adds that it is through the Emperor's son that intercourse between Abd-el-Kader and the English is carried on. Considering the well-known commercial intercourse between England and Morocco, in which the supply of fire-arms is freely acknowledged to be an important article, it is not difficult to account for the supply of English muskets, with instructions in English for their use. But it is evident that the Paris papers would leave it to be implied that the muskets were supplied to Abd-el-Kader by the English Government, which secretly encouraged the enmity of that celebrated Chief to France. On Friday and on Monday, in the Chamber of Deputies, explanations were demanded from the Government. On the subject of the war, M. Guizot expressed his anxiety to give every explanation. He declared that no cause of war rested between France and Morocco, but that Abd-el-Kader had taken refuge in the Moorish territory, where he recruited adherents against the wish of the Emperor, who was unable to give France the satisfaction required—namely, the expulsion of Abd-el-Kader. He further stated that France had no design on Morocco. It had no intention of extending its possessions in Africa. He considered that it would be madness to think of further conquest while Algeria was in a state of disorganisation. All that the Government demanded of Morocco was the disbanding of the corps formed on the frontiers, and the recal and punishment of the persons engaged in the attack upon the French. They asked, besides, that Abd-el-Kader should be either expelled from Morocco, or sent to the shores of the Atlantic. Their policy had no mystery ; nothing that could not be avowed and proclaimed before their allies and friends, as before the Chambers themselves. England no doubt was attentive to passing events in Morocco ; she had important interests at stake in that country. The Government had acted towards her on this occasion as every loyal, enlightened, and serious Government always acts. They made known to her in a general and perfectly correct manner their views and intentions ; they made them known to her, as they communicated them now, with less details than he had given to the Chamber, but they laid before her the whole truth, and assured her that their sole object was to obtain a just reparation and the security of their African possessions. It was their right, and they would enforce it. In the course of the debate, and in answer to a question addressed to him by M. Mauguin, Marshal Soult declared that France had not applied for the mediation of England to adjust her difference with Morocco, because she did not stand in need of that mediation ; and M. Guizot said, that whenever England should have occasion to appoint another Consul to Algiers, she must ask an *exequatur* from France. The Journals are, of course, fully occupied with the Morocco war. Those on the Ministerial side anticipate full success for France in the objects stated by M. Guizot to be those only which she has in view. The Opposition papers doubt a favourable termination of the affair, and accuse M. Guizot of unwarranted boasting. It is, however, the opinion of moderate persons in Paris that the Government will come out of the affair triumphantly : 1st, by obtaining satisfaction for the attack made upon the French troops on the frontier ; 2dly, by the sacrifice of Abd-el-Kader ; and 3dly, by having with great adroitness obtained of England, by committing her as a mediatrix, a full recognition of the right of France to the territory of Algeria. It appears that a little fleet of Swedish, Norwegian, and Danish vessels, consisting of the Danish frigates Gefien and Thetis, with the steamer Hecla, the Swedish frigate Josephine, and the Norwegian frigate Freya, is about to sail for Morocco. The Prince Royal Frederic of Denmark embarks on board the Hecla. The English Government are also concentrating a fleet of line-of-battle ships at Gibraltar, under Adm. Sir E. Owen.—The controversy which the memorable article of the *Moniteur*, relative to the "dotations," has kindled, is kept up with great spirit by the Opposition prints. It is likely to survive the present session, if, as the *Siècle* affirms, the author of the "unfortunate article, whoever he may be, has in store a number of complimentary articles which he intends to publish, notwithstanding the reception universally given to the first part of his demonstration." By the *National*, the electors of France are vehemently exhorted not to let the Deputies return to the capital without instructions to vote against any Bill that may be connected with a Royal dotation.—The Chamber of Deputies last week passed the Paris and Strasburg Railway Bill by a majority of 191 to 52, and the Chamber of Peers passed the Orleans and Bordeaux Railway Bill, having previously rejected the article added by the Deputies to the Bill, whereby no Members of either Chamber were to contract for or be directors of any railroad company receiving concessions from the state. The Ministry had demanded the rejection of this clause far more vigorously than they had opposed it in the Deputies. The Chamber adopted on the same day the Bill for changing the locks of the muskets of the infantry into percussion locks.—M. Chas. Lafitte, despite his repeated repulses from the Chamber of Deputies, has again been returned at Louviers by an immense majority, having had 331 votes while his opponent had only six. Since the last election M. Lafitte has withdrawn his offer for the branch railway to Louviers ; but it is supposed that some opposition will be made to his taking his seat in the Chamber.—The Chamber of Deputies was proceeding rapidly with the discussion of the budget, of which it has agreed to the principal chapters almost without debate.

SPAIN.—Accounts from Barcelona, of the 30th, state that General Narvaez is to take the department of Foreign Affairs, which is vacated by the retirement of the Marquis of Viluma. General Mazzaredo has been appointed successor to General Narvaez, as Minister of War. The Government papers continue to fill their columns with rumours of conspiracies, of which they say the Cabinet has information, in different parts of the country. The *Heraldo* describes these conspiracies as most extensive in Gallicia. The *Globe* says that the principal seats of the conspiracy are the cities of Barcelona, Saragossa, and Madrid. Private advices also dwell on this extensive plot, and on the critical situation of Galicia, where terror is said to prevail, and the prisons of Corunna, Santiago, Vigo, and Orenza, are crowded with political prisoners. Several of the journals publish articles or letters relative to the difference with Morocco, and represent the quarrel as becoming more and more serious, the Emperor exhibiting greater arrogance because he believes that Spain has solicited the mediation of England. The Cabinet are stated to have ordered 6000 men to proceed to Ceuta, under the command of General Villalonga, who has just distinguished himself in the Maestrasgo by shooting a large number of prisoners. It would also seem, by an article of the Ministerial print, that the Government are thinking of seizing upon no less a place than Tangiers.

PORTUGAL.—We have accounts from Lisbon this week, but politically speaking, they are unimportant. The Duke de Terceira, in addition to his duties as Minister at War, had been charged with the temporary performance of those appertaining to Senhor Costa Cabral, the Premier, and to S. Azevedo, the Minister of Justice : the one being incapacitated by ill health, and the other having resigned his office. The financial condition of Portugal was still lamentably bad. Even the allowance to the Queen for the Royal household had only been paid in part for the month of May ; and the whole of June was unprovided for up to the 2d of July.

ITALY.—The *Augsburgh Gazette* of the 3d instant publishes the following extract of a letter, dated from the frontiers of Italy :—"The intention of the Italian refugees was well known at Corfu. Every transaction was public, and the different Governments received notice of everything that was passing. The Austrian, Neapolitan, and Roman Consuls, made the most pressing representations on the subject to the British Government, but nothing could persuade it that the refugees had any serious object in view. When they actually sailed the governor refused to comply with the request of the Italian Consuls to send a steam-boat in chase of them. The Consuls then informed their respective Governments of what had occurred, and that so quickly, that the Governments were prepared to receive the Italian refugees on their landing." All the insurgents have now been captured, including the two sons of Admiral Bandiera. A letter from Florence of the 26th June informs us that Prince Jerome Bonaparte has precipitately left that city, after long occupying one of the finest palaces of Florence, where he formerly held a sort of court. The ex-King of Westphalia took up his residence in the country after the death of his wife, the Princess of Wurtemburg. It was at that period that he married his daughter, the Princess Mathilda, to M. Demidoff. He then sold his country house, and again lived retired at Florence, in the house of the Marchioness Bartolini, to whom, as is generally believed, he is secretly married. The Prince's sudden departure is ascribed to financial embarrassment which it is impossible for him to overcome at this moment. The Marchioness has not accompanied him.

GREECE.—Letters from Athens confirm the report that the Emperor of Russia having recognised the constitutional government of Greece, diplomatic relations are to be renewed with that state. M. Persiani, on the part of Russia, has communicated the fact to the corps diplomatique. It is reported that M. Daschkow, the consul-general in Moldavia, will go to Athens as Russian Ambassador, and that M. Persiani is recalled.

TURKEY AND SYRIA.—Letters from Constantinople of the 19th ult., state that the departure of her Majesty's steam frigate Devastation, having on board Mr. Allison, first attaché of the British Embassy, for the coast of Syria, has led to the general belief that the long agitated Syrian question, supposed to have been settled about 18 months ago, is about to be revived, and that another attempt will be made to arrange the differences of the Maronites and Druses.—A short time since a stone fell from the temple at Jerusalem. Each of the Christian sects inhabiting the Holy City was anxious to have the honour of restoring it to its place. As they could not agree amongst themselves which should repair the breach, Essed Pacha was appealed to, but he referred the disputants to Nabi Effendi, the superintendent of the Holy Sepulchre. Nabi, anxious, it is said, to please Russia, decided in favour of the Greeks, which so displeased the Catholics that they forwarded a complaint to the French ambassador at Constantinople, who immediately addressed a note to the Porte condemning the conduct of Nabi Effendi, and asserting that France alone had a right to watch over the preservation of the Holy City.—The Turkish government has given an order to forbid the building of the Protestant church at Jerusalem. The Porte had merely tolerated the construction of that edifice, but it had never granted a firman authorising the establishment of a Protestant church in the Holy City. Mr. Allison, it is said, has received instructions to inquire into the state of the English see at Jerusalem. —Petronowitch and Wutsitsch, who, since the last revolution in Servia, had been in exile at Sistiow, were lately to have received permission from the Porte to return to their homes, but Russia has so effectually employed her influence as to change the intention of the Turkish government.

WEST INDIES.—The mail steamer Thames has arrived, with accounts from Jamaica to the 9th ult., and from the other islands to corresponding dates. The Jamaica journals of the 8th are extremely indignant at the ministerial plans for the reduction of the duties on foreign sugar and coffee. The proposed reduction has created considerable alarm in the colony, and various meetings have been held and memorials prepared, deprecatory of so ill-advised and ruinous a measure.—Serious disturbances had taken place in Dominica, from the black population opposing the census which was ordered to be taken on the 3d June, and which they imagined to be a preliminary step to re-establishing slavery. The negroes in considerable numbers assaulted the enumerators and commissioners, and beat the magistrates who hastened to their assistance. The riot was suppressed, and about 100 persons were in gaol, waiting their trial. The Governor of the Leeward Islands, Sir C. Fitzroy, had arrived in H.M.S. Inconstant. About eight of the insurgents were killed and wounded. 200 men of the Royals were dispatched from Barbadoes, under the command of Lt.-Col. Archer, on the intelligence reaching that island. —From Mexico we learn that the 5th June was fixed for the extraordinary meeting of Congress, and at that meeting it was said that Santa Anna would demand additional powers, to enable him to act towards the United States on the subject of the annexation of Texas, which had created great excitement in Mexico. Much excitement prevailed among the English at Mexico, in consequence of an English gentleman, named Lloyd, having been shot through the arm by one of the sentinels at the Palace, for walking on the pavement before the Palace, a walk not prohibited to the Mexicans. Our minister, Mr. Bankhead, had immediately interfered, and the soldier, as well as the officer on guard, had been placed in arrest. —In Cuba, it is said, affairs are in a most disordered state. The prisoners in the jails at Matanzas and elsewhere amount to many hundreds. Several more had been shot, and certain English and Americans were ordered by O'Donnel to be tried. The jealousy of the English, particularly those from Jamaica, is on the increase.

UNITED STATES.—By the packet-ship Rochester, which left New York on the 23d ult., we have accounts from New York to that date. Congress had adjourned on the appointed day, the 17th ult., without having transacted any business of importance. The Senate had confirmed the nomination of Mr. Cushing, as Minister to China, and also that of Dr. Clemens, son-in-law of Mr. Calhoun, as Chargé d'Affaires to Belgium. Colonel Thompson, the special messenger to Mexico, had returned to Washington ; but the reply of Santa Anna to President Tyler, in respect of annexation, had not been communicated to Congress, although it arrived prior to the adjournment. On the next day (the 18th) a messenger arrived with despatches from Senor Bocanegra, the Foreign Minister of Mexico, to General Almonte, the Mexican Minister to the United States. The Spanish journal published in New York gives the text of these despatches. Senor Bocanegra informs the General, in the most emphatic terms, that Mexico will never assent to the annexation ; that the Government and the nation are immovably determined to resist the project and reject all proposals for its consummation, whether accompanied or not by offers of compensation ; and General Almonte is authorised and instructed to contradict, in the most formal manner, any assertion or intimation of a different character. The despatch is

dated May 20. The New York papers observe upon this, that it is now perfectly clear, and must be so even to those who have hitherto doubted, that if the Senate of the United States had not resisted and defeated the project of "immediate annexation," the United States would have been at this moment at war with Mexico.—Mr. Macready, the tragedian, is to return to England in September, after a most lucrative career in different states of the Union.

Parliament.

HOUSE OF LORDS.

Friday.—After the discussion on Morocco noticed in our last, the Bank Charter Bill, on the motion of the Duke of WELLINGTON, was read a first time.—Lord CAMPBELL, in a speech pointing out the present state of the law on the subject, and the necessity for improvement, moved the third reading of his Law of Libel Bill.—The LORD CHANCELLOR opposed it, contending that it would lead to great inconvenience, without any countervailing advantage.—Lord BROUGHAM supported the Bill.—Lord DENMAN thought that the subject had not received that due and sufficient consideration which would warrant them in legislating. Public opinion had effected a great change in the practice as relating to prosecutions for alleged libels on a Government. Attorney-Generals, judges, and juries, would shrink from prosecuting or convicting defendants for comments on public men or public acts, which half a century ago would have insured punishment. As to private libels, the Bill afforded to defendants, under the guise of proving the truth, a licence which might be abused to an alarming extent, in the propagation of slanderous accusations, under which innocent men might be subjected to a torture greater than any verdict could deliver them from.—Lord CAMPBELL replied; and the Bill was rejected, on a division, by 33 to 3.—The Presbyterian Marriages Bill went through committee.

Monday.—On the motion of the Duke of WELLINGTON, Lord Colborne was substituted for the Earl of Burlington, to serve on the Post-office secret committee.—Lord WHARNCLIFFE gave notice, that on Friday he would move the second reading of the Charitable Donations and Bequests (Ireland) Bill.—The Bishop of EXETER stated his decided objection to the Bill, on account of the 11th and 17th clauses, which recognised "Roman Catholic ministers duly appointed according to the laws and constitution of the Roman Catholic Church"—which was, in fact, recognising the jurisdiction and supremacy of the Pope within this realm.—Lord WHARNCLIFFE promised to consider the subject.—Lord WODEHOUSE complained of statements made in the *Times* newspaper connecting the incendiarism in Norfolk and Suffolk with the administration of the Poor Laws. In rather a warm manner, he invited the "gentlemen of the press" then present to visit with him the poor-houses in his county, when he promised to convince them of the falsehood of the statements.—On the motion of the Marquess of NORMANBY, a return of the number, age, and sex of the persons committed for trial at the last assizes in Norfolk and Suffolk, on the charge of incendiarism, with the result of the trials, was ordered.

Tuesday.—On the motion of Lord WHARNCLIFFE, the Union of Parishes (Scotland) Bill was read a third time and passed.—The Bank Charter Bill was read a second time without any discussion, and its committal fixed for Monday.—The Bishop of EXETER moved the third reading of his Brothels Suppression Bill.—Lord Foley opposed it, and moved its third reading that day six months.—The Duke of WELLINGTON advised the Right Rev. Prelate not to press his measure this session, but to leave it for consideration in another year. With respect to the feelings of Government on the subject, he was bound to say that, while Government earnestly desired to mitigate the evils resulting from these establishments, they entertained a strong feeling that, from the nature of the difficulties, it would be impossible to carry the provisions of the measure into execution. It appeared to them that this was a somewhat stringent measure, and that without additional regulations and arrangements, neither the Government nor the magistrates could carry it into execution.—The Bishop of EXETER, upon this, withdrew his Bill.—A great many petitions, chiefly against the Dissenters' Chapels Bill, were presented.

Thursday.—A great number of petitions were presented against the Dissenters' Chapels Bill, one of which gave rise to a discussion on the point of "order," in which Lords CAMPBELL, BROUGHAM, CLANRICARDE, MOUNTCASHEL, KENYON, and WICKLOW took part.—The Earl of RODEN gave notice that he should do everything in his power to defeat what he considered one of the most iniquitous and dangerous measures that ever was proposed to Parliament.—The Earl of POWIS stated the course he proposed to take upon the Bangor and St. Asaph's Bishoprics Bill, in consequence of the report of the committee on precedents, and of the intimation given by the Duke of Wellington that the Royal sanction was not likely to be given to the Bill. He said the only courses open to him were either to withdraw the Bill, or to press it forward with the chance of carrying it through its remaining stages in their Lordships' House, despite the report of the committee, but also with the risk of being beaten. After the best consideration he came to the determination not to risk the vantage-ground he had already obtained in having the Bill sanctioned by the majority of the House, and its passing only impeded by a technical interposition. He should therefore withdraw it, convinced that, sooner or later, further discussion must take place on it, as there were only thirty-seven Peers who voted against the principle of the measure. The noble Earl asked leave to withdraw the Bill.—The Bishop of SALISBURY answered at length the arguments adduced by the Duke of Wellington in opposition to the Bill on a former night, and concluded by expressing his hope that the Government would consent to re-consider the matter, and if they did not feel at liberty to bring it forward themselves in a future session, that they would at least allow it to be proceeded with in the ordinary way, and without further objection.—The Earl of MOUNT EDGCUMBE acknowledged that he had voted against the second reading of this Bill contrary to his convictions, and solely on the ground that he thought it was for the public weal to give a Government of which he approved an unvacillating and consistent support. He looked upon it as a misfortune that the majority of their lordships should be overborne by the Government on this question; and strongly recommended Ministers to reconsider the subject and give facilities for its being brought forward next session.—The Duke of WELLINGTON replied to the Bishop of Salisbury's arguments on the general principles and effect of the Bill, and denied the undue use of the prerogative of the Crown. It was the duty of the Ministers of the Crown, when a measure which they considered injurious instead of being useful, and likely to affect the prerogative of the Crown, was introduced into Parliament, not to advise the Crown to consent to the discussion of such a measure.—Lord LYTTLETON maintained that the use made of the prerogative of the Crown was, in this instance, at least unusual. He would not say with the Duke of Newcastle, that it was "a State trick—an unworthy manœuvre," but he would assert, that the course resorted to was an unfair mode of getting rid of this measure.—Lord BROUGHAM said, that as a constitutional lawyer, it was his opinion that the House was not debarred from passing the Bill, if they chose, without any consent from the Crown. He, however, recommended the withdrawal of the Bill.—The Marquess of CLANRICARDE asserted that the reason why the necessity of the Royal consent had been so unexpectedly discovered was in order to avoid the scandal of seeing the President of the Board of Trade and the Chancellor of the Exchequer voting in its favour, and in opposition to their colleagues, should the Bill have gone down to the House of Commons.—Lord WHARNCLIFFE deemed that either Mr. Gladstone or Mr. Goulburn were favourable to the Bill, although the latter gentleman's constituents certainly were.—The Bishop of BANGOR approved of the withdrawal of the Bill under the circumstances.—The Bill was finally withdrawn.—Lord MONTEAGLE moved an address to Her Majesty, stating that the accommodation for the pauper lunatics in Ireland was utterly insufficient, and praying Her Majesty to be graciously pleased to take into her immediate consideration the means necessary for their better accommodation.—Lord WHARNCLIFFE assured the noble Lord that the Government were most anxious on the subject, and had taken steps to carry their intentions into effect.—The motion was negatived without a division.—The Charitable Loans Societies Bill was read a second time.

Friday.—The Duke of RICHMOND stated that the committee on *Qui Tam* Actions had authorised him to state that the evidence of Mr. Russell should be communicated to the individual in the other House (Mr. Christie who had brought forward the subject.—The Earl of RADNOR thought it was improper to publish parts of evidence of a sitting committee.—The Marquis of NORMANBY called attention to the speech of Mr. Christie, made on Thursday night in the other House, in which the hon. member said, there was presumptive evidence of a conspiracy between certain members of that House and the Chairman of the Lords' committee on *Qui Tam* Actions. He was sure that his Noble Friend (the Duke of Richmond) was beyond all suspicions of the sort.—The Earl of RADNOR also defended the Noble Duke.—The Duke of RICHMOND said he did not feel the least annoyed at the statements made elsewhere, as regarded himself; he stood upon his own character; only he thought that gentlemen, especially if young Members of Parliament, ought to be cautious in imputing improper motives to any one.—Lord MONTEAGLE defended the conduct of Mr. Christie, who would not willingly do a wrong.—Lord CAMPBELL said there was no ground for casting imputations on the Noble Duke; he confessed, however, that the Members of the other House might have had some cause for the views some of them had taken.—The Earl of RADNOR presented another petition from Mr. Mazzini, complaining of his letters being surreptitiously broken open.—The Marquis of NORMANBY postponed until Tuesday week his motion respecting the sanatory condition of towns.—[Left sitting.]

HOUSE OF COMMONS.

Friday.—After the withdrawal of Col. Sibthorp's motion for the abolition of the Poor-Law Commission, the House proceeded with the different clauses of the Poor-Law Amendment Bill. The first clause having passed, Sir J. GRAHAM proposed, on the 2d clause, that 12 months should be allowed instead of six, for the mother's application against the father to obtain maintenance for the illegitimate child. It was equally necessary for the purposes of justice that there should be some limitation of time, and that the time so limited should not be too short. After some discussion, Sir J. GRAHAM proposed, with the general assent, to allow that the father should be liable to a summons at any time, on proof that he had paid money for the child's maintenance within twelve months from its birth.—On the 4th clause, Mr. BECKETT DENISON objected to the enactment giving to the putative father the power of appeal. The woman would never have the means of meeting such a process. It would be better that the adjudication should be by three justices instead of two, and that their decision should be final. Several members concurred in the objection to the appeal, especially as it was given only to the man, and not to the woman.—Sir J. GRAHAM feared that the question was one upon which no further consideration would enable the House to form a better judgment. He thought that the power of two justices in petty sessions to charge a poor man with the payment of a weekly sum for 13 years was a large and dangerous authority, if left without appeal. It was, however, a matter upon which he had not a very strong opinion, and which he must leave to the decision of the committee.—Mr. WAKLEY pressed urgently for reconsideration, with a view to the extension of the appeal to the woman. The distress of women, chargeable with the maintenance of their illegitimate children was the cause of weekly and daily infanticide.—The committee, after some discussion, went to a division, the result of which was, that the appeal was left to the man; and to the woman the right of renewing her application.—On the 11th clause, empowering the commissioners to regulate the apprenticing of poor children, Sir C. NAPIER and others contended, that this direction was better left with the guardians, who had personal knowledge of the circumstances of each case.—Several members concurred in this view, and the clause was modified to meet their objections.—On the 13th clause, touching the constituency for the election of guardians, Mr T. DUNCOMBE proposed that no more than one vote should be allowed to one person.—Sir J. GRAHAM justified the clause as it stood; and, on a division, it was sustained in its original shape.—Discussions followed on other clauses of no general interest, and after numerous amendments and divisions the clauses, down to 19 inclusive, were agreed to.

Monday.—In reply to Mr. SHEIL, Sir R. PEEL stated that our Consul at Algiers was not there under an *exequatur* from the French Government. In fact the Consul was appointed in 1827, under the authority of the Turkish and Algerine Governments. In 1830 the expedition of France was undertaken, and Algiers was occupied. The Duke of Wellington's Government was succeeded by that of Lord Grey, and during the whole period of that noble Lord's Government the question was not stirred, nor was there any acquiescence. The question stands now precisely as it did in 1830, and during the whole period that Mr. Sheil and his friends were in office.—In reply to further questions put by Sir C. NAPIER, the PREMIER stated that there never was a period when the power of this country to make a great naval demonstration was greater than at present, although the number of ships actually commissioned is small. He also announced that our Consul-General at Tangiers is at present with the Emperor of Morocco, and that therefore the report is untrue that the Emperor had refused our mediation.—After an unavailing attempt on the part of Mr. C. WOOD, Lord PALMERSTON, and Lord HOWICK to extract further information on the subject, the matter dropped.—On the order of the day for the second reading of the Railway Bill, Mr. GISBORNE moved as an amendment that the order be discharged. It was impossible, he said, if the measure should be hastily passed, that, opposed as it was by the whole railway boards, and carried as it must be in haste, it could work well. They required therefore time till the next session to mature the Bill.—Mr. C. RUSSELL seconded the amendment. The railway companies complained that they had not been fairly heard; they had been kept in ignorance of the scheme of the Board of Trade, until it appeared in the specific shape of the Bill before the House; but its appearance was the signal for universal alarm. On behalf of interests involving upwards of one hundred millions of invested capital, he besought a postponement till next session, and trusted that the House would not refuse so reasonable a request.—Mr. GLADSTONE said that it would absolutely preclude them from going into the merits of the Bill, which was wholly misunderstood out of doors. Let them go into its discussion, and then any amendment for postponement could be fitly introduced.—Sir R. PEEL said that the railway companies, presuming on their reputed strength, instead of acting on the ancient maxim, "Strike, but hear," were determined not even to permit an Executive Government to state its views on a measure introduced for the public interest. Now was the time to legislate; a spirit of railway speculation was abroad; 62 Bills had been applied for this session, and next session would witness many more. He begged the House to recollect that class of the community which had hitherto received no benefit from railways, and for whom the Bill provided, by requiring the establishment of third-class trains.—Mr. HAWES, Mr. LABOUCHERE, Mr. WALLACE, and others made a few observations; and Mr. GISBORNE, seeing the feeling of the House in favour of a discussion, withdrew his amendment.—A number of petitions were then presented, chiefly against the Bill; after which Mr. GLADSTONE rose to make the Government statement on behalf of the Bill. Several remarkable instances had recently occurred of Bills misrepresented and misunderstood, but in no case had there been more formidable organisation against a measure, or grosser perversion of its real nature. So solicitous were the Government to protect railway interests, that they were accused of having "packed" the committee, which, constituted as it was, had come substantially to an opinion, if not in favour of this precise measure, at least in approbation of an interference to a similar extent. He was surprised by the allegation that the evidence was *exparte*; if it were so at all, it was on the side of the railway companies, as he showed by reading the names of influential individuals connected with their management who were examined as witnesses. Running over the clauses of the Bill, affirming that the portion of it which provided for the humbler classes conveyance at a penny a mile, in carriages sheltered from exposure to the weather, constituted a national question of some importance, he came to what he considered the essence of the Bill, the power of "option." On this point great delusion prevailed; it was assumed that the Bill gave to the Executive Government the option of purchasing for the State existing or future railways, or of revising their tolls at discretion. This he strongly denied, and said, if it were so, he would himself vote against the Bill. The Executive would have no power under it of purchasing without coming to Parliament in each specific case. Railways constituted a new element in our social state; it was impossible to foresee in what position we might be placed by them ten or fifteen years hence; and all that the Bill proposed was, not to violate public faith by giving to the Executive a present option of purchase, but simply to "reserve" to the Legislature at some future period the right to do so without being barred by the plea of "vested interest," if it should then be deemed politic and expedient. An Executive could not purchase a railway without money, nor obtain money without coming to Parliament, and showing good ground for the demand. If it were feared that the Bill would enable the Executive to tie up the discretion of the Legislature, let them devise any proviso which would prevent it, and it should have his approbation. There was a difference of two-thirds between the fares of our railways and those of Belgium; and although it was said that this was a much richer country, we paid no more, rather less, for our cotton goods. Seeing that the public were interested to the extent of fifteen millions annually, and that under the present system of rival companies, and anxiety to realise large dividends, no general experiment of cheap communication could be tried, it was wise to reserve a right to the Legislature of purchase, if future circumstances might render it an object of national policy. It might be asked—Why not be content with a naked reservation? That would prove a mere *brutum fulmen*, like a former resolution of the House; and it was desirable that the limits should be clearly defined, on the faith of which capital might be invested. The old railway companies urged that the Bill would submit them to ruinous conditions hereafter. Really, after the rather unprecedented attempt to suppress discussion on a Bill based on the report of a select committee, they were too bashful in asserting either their power or their pretensions. Even at that moment he was addressing a majority of railway proprietors; his own family were as largely interested as any other; and it was ludicrous to imagine that these powerful combinations could not protect their interests at any future period. Time was asked for the consideration of the Bill. But it was not a measure of definitive legislation, being simply one of precaution, so far as its leading provisions were involved; and the allegation of being surprised by the Bill was contradicted by the fact, that the recommendations of the committee, on which it rested, had been before the public three months. They were tempted to postpone the Bill, by bland promises of consideration next session. But delay would render these powerful companies only stronger and more arrogant; and it would not be his fault if Parliament let slip the present favourable opportunity for legislating. They were urged to leave railways, like anything else, to the natural operation of competition; but he would as soon hear the Gracchi speak on sedition, as railway proprietors on competition. Illustrating this by anecdotes, and extracts from evidence, he showed the high ground taken by the advocates of the inviolability of railway property, and attributed the entire opposition to the Bill to the active agency of railway agents and solicitors, who knew well the arts of raising it, whether by private canvass or public misstatement—such as fastening on the fifth, and discreetly overlooking the third report of the committee, or forgetting such evidence as Mr. Glynn's, recommending that if they legislated it should be immediate. They were told of "a shock to railway property;" but the Bill had not been exposed to a dull day in the money market. Since the publication of the third report fifteen new railways had been projected, and, since the appearance of the Bill, railway shares had risen! On Monday week a lugubrious body of men—railway directors in front—solicitors and agents in the rear—waited on Sir R. Peel and himself, to ask for a postponement of the Bill; and when they were told that the Government were resolved to press it, they retired with doleful predictions of injustice, interference, and ruin; yet since that event the shares of the Great Western have risen 5*l.*! The opposition to the Bill had but strengthened his determination to proceed with a measure, moderate in its claims, and precautionary in its nature; and he did not think that the railway companies had mounted so high, or the House of Commons sunk so low, as to cause its rejection, the second reading of which he concluded by moving.—Mr. ENTWISLE, as one of the "lugubrious deputation" that had waited on the Government, commented on the Bill, which he contended was unjust to the railway companies, while the clamour for third class trains was supported by gentlemen who were as desirous of availing themselves of them as the poor man, for whose cause they clamoured. He moved the second reading of the Bill that day six months.—Colonel SIBTHORP disclaimed what had been attributed to him in the public papers, that he had lost confidence in the Government. Comparing it with the late one, of whose ten years' tenure of office he knew no good, he considered it his highest duty to prefer it, even though occasionally differing with it. But, though not always approving of the measures of the President of the Board of Trade, on this occasion he warmly approved of the Bill; he possessed no railway shares, and he hated the very name of railroads, all of which he considered dangerous, delusive, gambling, and unsatisfactory speculations. Private property must succumb to public good. Delays were dangerous, and the Government must beware of man-traps and spring-guns.—Mr. LABOUCHERE, Lord SANDON, and Mr. CARDWELL spoke in favour of the second reading; and Mr. M. PHILIPS and Mr. PARKER against it.—Mr. SHEIL asked if the Dublin and Cashel Railway would be affected by the Bill?—Mr. GLADSTONE said it would affect all future railways.—Mr. SHEIL then said that the shareholders had subscribed their money without any cognisance of the intentions of the Board of Trade. If it passed, it would check railway enterprise in Ireland. There were two thousand miles of constructed railways in England, which would be exempted from the operation of the Bill; in Ireland only five, the Dublin and Kingstown; and they would therefore cover the face of the country with anomalies. He was afraid of augmenting the patronage of the Government; the Board of Trade was very near the Treasury.—Mr. CARDWELL was concerned with the Dublin and Cashel Railway, the Bill for which was not yet carried through Parliament, and therefore its promoters would have no injustice to complain of. In ordinary cases trade was best left free; but this did not apply to railways, and he called upon the public to watch monopoly with jealousy. He therefore hoped that no indiscriminate opposition would be offered to the Bill, which, without

GARDNER'S CHRONICLE

injustice to railway proprietors, was calculated to be eminently beneficial to that great portion of the community who have not yet enjoyed their benefits.—Mr. F. BARING did think that at this late period of the session so important a measure should be postponed. They were not justified, except on actual necessity, in interfering with private speculations; but when the necessity existed, it would justify interference with existing as well as future railways. But the Bill would not prevent the evils it professed to be intended to cure.—It being past twelve o'clock an adjournment of the debate was moved, which, being opposed, a division took place, when it was rejected by 175 to 53.—Mr. HINDLEY then addressed the House against the Bill, when the adjournment was again moved.—Sir R. PEEL regretted that the minority did not defer to so large a majority, and come to a decision on the second reading of the Bill. However, after some conversation, the adjournment was agreed to.

Tuesday.—The House met at 12 o'clock, and the SOLICITOR-GENERAL moved the second reading of the Sudbury Disfranchisement Bill. A petition was presented from the Mayor, Aldermen, and Burgesses of the borough, praying to be heard by counsel against the Bill, which, on the motion of Mr. BLACKSTONE, was conceded.—Mr. HILL, Q.C., having then addressed the House, the SOLICITOR-GENERAL contended, despite what had been advanced by Counsel, that the majority of the electors of Sudbury had been proved to be tainted with bribery, and that no grounds had been shown to warrant the House in arresting the progress of the Bill.—Mr. BLACKSTONE said, although he would not oppose the second reading, that when the House went into committee on the Bill, it was his intention to move that, instead of disfranchising Sudbury, the right of voting should be extended to the adjacent hundred. This had been the course pursued with respect to East Retford, to which the hundred of Bassetlaw had been added. If he should be unsuccessful in this, it was his intention to take the sense of the House on the principle of the Bill, upon the third reading. —Mr. D. BROWNE thought that there were other boroughs, besides Sudbury, which ought to be disfranchised; and that, when the franchise was taken from a corrupt place, it ought to be given to some populous town, in order to maintain the balance of representation.—Mr. W. WYNN recollected no borough which had exhibited more systematic bribery and corruption than Sudbury. The Bill was then read a second time, and the House at three o'clock adjourned till five.—At the five o'clock meeting Mr. CHRISTIE brought on the subject of the Danish claims, and was supported by Mr. HUME, Colonel SIBTHORP, Mr. HAWES, Sir C. NAPIER, and Mr. MUNTZ.—The CHANCELLOR of the EXCHEQUER and Sir R. PEEL both contended against the validity of the claims, and expressed the determination of the Government, backed as they were by legal opinion, to resist them.—On a division Mr. Christie's motion was rejected by 72 to 68.—Mr. LIDDELL moved for a select committee to inquire into the practice of dog-stealing, and into the best means of checking the evil. He stated that in the last and present years the money paid in this metropolis for the restoration of stolen dogs under a compromise amounted to 970*l.*, collected by an organised gang of dog-stealers.—Sir J. GRAHAM admitted that the crime of dog-stealing was very prevalent, and ought to be checked, and he should not therefore resist the motion, especially considering that we were in the month of July.—The appointment of the committee was agreed to.—Mr. HUME moved for an address to the Crown, praying that the Royal Academy may be rendered more conducive to the advancement of the Fine Arts, better suited to the spirit and circumstances of the present age, and more consonant with the original intention of its royal founder, George III.—While he was speaking the House was counted out.

Wednesday.—The House met at twelve o'clock, and, in addition to the routine business, devoted till five o'clock to the consideration in committee of the two Joint-Stock Companies Bills.—Some desultory conversation took place on the counting out of the House on the previous night, and on the arrangements for securing judgment in the House of Lords, in the O'Connell Writ of Error, during the present session. The CHANCELLOR of the EXCHEQUER said, that Government would offer no impediment to the immediate delivery of judgment.—Mr. COWPER moved the second reading of the Field Gardens Bill, the object of which was to afford employment and amusement to the working classes; to give them the means of innocent recreation, of which, in some sort, all men stood in need. He was in hopes, too, that such allotments as he proposed would be the means of identifying the owner of the soil in interest with the occupier. The hon. gentleman read portions of the evidence taken before the allotment committee, to show the change of sentiment worked in the minds of the operatives by becoming possessed of land, and their consequent contentment; that the Chartist no longer speculated on the visionary scheme of having the whole land cut up into small parcels, when under this system he enjoyed the very advantages held out *in prospectu*, and that with a moderate rent the owner was often able to clear 5*l.* a year on a quarter of an acre. This evidence fully proved that great advantages must accrue from the adoption of this system, and that there were no countervailing disadvantages. This Bill enacted that all the powers heretofore conferred on churchwardens and overseers should be transferred to a new board called the Garden Board, and their power of purchasing land was alone excepted. There was a limit placed to the amount of land to be appropriated —the average would be about a quarter of an acre for each individual. The adoption of this body by any locality was quite discretionary. It was intended that the benefits of the system should be conferred on those only who were rated below 10*l.* a year. The board was to consist of five persons: two elected by those rated above 10*l.*, two by those rated below 10*l.*, and the officiating clergymen. Those who were to be benefited by the Bill had thus a direct control over the acting body, and it was to be hoped they would elect such persons as would take a strong interest in its proceedings. The period of their election was for three years. They were authorised to take from the poor-rate the necessary amount for rating land, there being inserted in the Bill a compulsory clause for repayment. They were entitled also to get leases from the commissioners, who had the controlling power over commons. He should not care how much his Bill was changed, provided it reached its object—the giving of a piece of land to those able and desirous of cultivating it. His only object was the benefit of the poorer classes, whose interests, in proportion as they were represented in that House, should be the more carefully looked after. The legislation of the present session held out no prospect of any measure being passed for their benefit, when it was known they were suffering from great poverty. The increase of population, and the competition in every department of labour, tended to diminish profits, and to lower wages, but if things were left to their own course, the poverty of the poor must become greater in proportion as the wealth of the country became more extended. Poverty was the great cause of the suffering of the labouring poor. This Bill tended to diminish it, as it increased the actual income of the poor man. Though the evils attendant on the present condition of the poor might be mitigated by our present prosperous state of trade, yet that discontent was rankling beneath the surface was proved by the fires in the eastern counties, and by the opinions broached by the poorer classes through many parts of the country. He hoped he should be allowed to read his Bill a second time. —Mr. S. CRAWFORD seconded the motion, and expressed his cordial approval of the Bill, in which he recognised the means of carrying out the recommendations of a committee on the allotment system, whose report, although made in 1839, had until now been a dead letter. There were two essentials to the proper working of the proposed system—one that the rents should be moderate, and the other, that the labour applied should be as skilful as possible. The unhappy condition of the small holders in Ireland illustrated this. Schools should be established for teaching proper modes of cultivation, such as that established by a benevolent lady at Eastbourne, in the county of Sussex. The land of England was not half cultivated; if it were, it would give food and employment to the whole population. He highly approved of the general object of the Bill. He did not understand, however, why there should be a limitation of 1-20th as to the newly-inclosed lands for the purposes of this Bill. His view was, that not a particle of common rights should be given up, except for the purpose of providing the poor with land. He did not think it desirable that the land allotted should be limited to a quarter of an acre. He did not think that less than an acre was desirable. He was still, however, willing to accept a smaller portion, provided the employment was ample. If the Corn-laws were repealed to-morrow, continuous employment in manufactures was impossible. It was absolutely necessary, therefore, that both the agricultural and manufacturing poor should be allotted some small portion of land, to save them from destitution.—Mr. FERRAND thanked Mr. Cowper for his Bill. The system was carried into effect to some extent in the north, and to render it more efficient, it was only requisite to appoint some such responsible body as that proposed. He hoped Government would allow the Bill to become the law of the land.—Mr. ESCOTT was of opinion that the present allotment system, which was voluntary in its nature, had worked well, and to this conclusion the evidence taken before the committee on allotments led. He was alarmed at the consequences which might follow from giving a compulsory power of taking land, and would prefer an extension of the present system under proper regulations.—Mr. HUME doubted that the provisions of the present Bill would have a very salutary or beneficial operation, though it was a very great evil that the labourer should have so scanty an interest in the soil. —Sir J. GRAHAM said it was not his intention to oppose the second reading of the Bill, as there appeared to be no wish in any quarter to obstruct it, and he thought the House and the country were indebted to the honourable member for the attention he had bestowed on this subject. With respect to the preamble of the Bill, which was to the effect that small allotments of land are conducive to the comfort and well-being of the labouring classes in the rural districts, he was not disposed to suggest any doubt, but he agreed with the two honourable members who had last addressed the House, that the prosperity of the system mainly depended on the voluntary countenance and support given by the landed proprietors, and that it was a question whether legislative interference might not be prejudicial to it. With all deference to Mr. Crawford, who seconded the motion, whose philanthropy was beyond suspicion, he must say he was surprised, looking to the experience which the hon. gentleman must have had of the effects of a somewhat similar system in his own country, that the hon. gentlemen should have expressed himself so decidedly in its favour. He understood him to say, that the occupation of a small portion of land, cultivated by spade husbandry, was a certain security for the independence, comfort, and happiness of the peasantry. He (Sir J. Graham) thought no small portion of the distress prevalent in Ireland was to be traced to the minute portions into which the land was divided. The way in which he thought the system of giving small allotments of land might be made most valuable, was not by making them sufficiently large to afford full employment to the labourer, but by giving him enough to occupy his leisure hours. That was the real use of the allotment system, and he must say he thought an acre of land appeared to be too large a quantity. He did not wish to enter into the details of the measure, relative to which he should have some observations to offer hereafter. The hon. gentleman said that there was great unwillingness on the part of the landlords to let land in this way. The present Bill, however, would afford ample protection and security to the landlords, inasmuch as the poor-rates would be made chargeable, under its provisions, with the payment of the rent. He apprehended, however, that in several points the machinery of the Bill would be found to require material alteration. He entertained great doubt as to the construction of the trusts for management, and he thought the provision, as to charging the rent of the land on the poor-rates, liable to the dangers of abuse, as well as to the creation of jealousy and ill-will in the parishes. He was not disposed, however, to enter into a critical examination of the details of the measure. He was afraid that the compulsory clauses would not be found conducive to its success; but, regarding the subject as one of great importance, and seeing that it had been recommended by a committee of the House, he did not think he should be acting consistently with the principles which guided the course taken by Government with reference to the working-classes, if he opposed the second reading.—Mr. CHILDERS concurred generally in the object of the Bill. It was true there was too much apathy on the subject, but still it was to be hoped there were in every parish some philanthropic individuals who would interest themselves in carrying the measure into operation.—Lord WORSLEY thought field-gardens might be very useful, but care must be taken not to discourage cottage gardens. The cottager ought to look to them not for subsistence, but for assistance.—The Bill was then read a second time.—The second reading of the Court of Arches Bill was opposed, and on a division rejected by 30 to 17.—The Bill introduced by Lord PALMERSTON, as chairman of the committee on gaming, and the object of which is to extend the previous Qui Tam Act, so as to stay actions until the report of the committee has been embodied into a general legislative measure, stood for consideration in committee; and on the order of the day being read, Mr. CHRISTIE moved that Mr. Russell, in whose name the actions were brought, should be heard by counsel at the bar. Upon a division, the motion was negatived by 30 to 14, and Mr. CHRISTIE then moved that the Bill be committed that day three months, and complained in strong terms that he had not been fairly treated, having been led to believe that his previous motion would not have been resisted, relying upon which belief, Mr. Russell had gone to the expense of employing counsel.—The CHANCELLOR of the EXCHEQUER and Lord PALMERSTON respectively exonerated themselves from this charge, as did Lord STANLEY from the imputation thrown out by Mr. M. Gibson, that the Government had treated the question timidly and with vacillation.—Mr. V. SMITH, however, repeated it, and drew from Sir J. GRAHAM a further explanation of the course they had adopted. The original Bill for suspending the actions had not been introduced by them, and they had therefore declined to bring in a fresh one to continue its operation.—Capt. BERKELEY had originally opposed the Bill as a means of relieving persons from penalties they had incurred by transactions which had brought the turf into disgrace, but having heard, as a member of the Gaming Committee, the reasons which had induced the parties to bring the actions, he was reluctant that such characters should reap such immense profits. For himself, he would prefer that a son of his should go to the common hazard-table, rather than enter into the chicanery of "book-making," and the dirty work that was now inevitable in those who meddled in horse-racing. The excessive gambling on the turf had brought it into disrepute; and as long as it continued, he would assist in relieving no one from the liabilities he incurred.—Sir G. CLERK and Mr. CHRISTIE exchanged some explanations; and Col. PEEL then endeavoured to relieve himself from the imputation cast upon members of the turf generally by Mr. Baron Alderson during the recent trial of the "Running Rein" case, that they "associated with blackguards." He had never seen any one of the parties to that case until he met them in court; and it was because he and Lord G. Bentinck refused to associate with them, that they had been most unfairly attacked. He complained especially of Mr. M. Gibson's conduct in holding frequent communication with Russell, with the view of eliciting evidence in support of the Qui Tam actions.—Mr. GIBSON explained. His only object had been to elicit the truth.—Lord G. BENTINCK repeated the accusation, and mentioned several particulars in support of his charge. He denied that the Bill was a piece of class-legislation, or that it was, in any degree, indebted for the support it had met with to the high station of those in whose favour the former act had been passed. There were numberless precedents for such Bills; and it was hard that class-legislation was attributed to those who endeavoured only to frustrate the schemes of persons whose infamous character did not prevent Mr. Gibson from associating with them.—Mr. HUME supported Mr. Christie.—Mr. ESCOTT and Mr. HAYTER, who had been members of the Gaming Committee, vindicated Mr. Gibson's conduct.—A short discussion upon some strong expressions used by Lord G. Bentinck ensued; and the House then divided, negativing Mr. Christie's amendment by 45 to 9. —The Bill then passed through Committee.—Upon the order of the day for the committee upon the Sudbury Disfranchisement Bill being read, Mr. BLACKSTONE complained of the late period of the session at which the Bill was brought forward, and mentioned the cases of Harwich, Nottingham, &c., in which, he maintained, bribery as flagitious as that at Sudbury had been committed. He moved, that instead of disfranchising the borough, the right of voting should be extended to the adjacent hundreds.—Capt. BERESFORD seconded the amendment, and was supported by Mr. COCHRANE. In Nottingham no less than 12,000*l.* had been expended at one election, and yet upon proof that 250*l.* had been spent among 8000 electors in Mr. Walter's behalf, that gentleman had been unseated. This was a most monstrous case; and upon the grounds on which Mr. Walter had been deprived of his seat, every Member of the House might, he believed, be declared unduly elected.—The SOLICITOR-GENERAL defended the Bill; and the amendment having been negatived by 37 to 1, it went through committee, and the House was then counted out.

Thursday.—After some routine Bills were advanced, and a few unimportant questions put, the adjourned debate on the second reading of the Railways Bill was resumed by Mr. BRIGHT, who supported the amendment for reading it a second time that day six months.—Lord SEYMOUR could not see the slightest objection to the principle of the Bill, and believed that whatever was objectionable in its machinery might be amended in committee.—Mr. BERNAL and Mr. COLQUHOUN opposed the Bill. The latter said that, with respect to the power of the Government to purchase railways, it was quite clear that, under this Bill, the Government would have the power to purchase railways. Supposing that the Government came down to that House to ask for an estimate for the purchase of a particular railway, was it to be doubted that they would obtain that vote from the House, particularly if they stated that it was a question on which they were ready to stake their existence.—Mr. WALLACE and Mr. J. S. WORTLEY supported the Bill, and Mr. GISBORNE opposed it.—Mr. C. BULLER ridiculed the idea of making the Government the controller of speculations dependent for their vitality on individual enterprise, and urged that, at least delay was due to those who had embarked their capital in speculations so materially promotive of the public welfare.—Sir R. PEEL admitted that the greatest credit was due to those whose capital and enterprise had developed our admirable railway system. The time, however, had arrived, when it was requisite that our legislation should be based on specific principles; and the public interest required that a conclusion should be adopted in favour of the Bill, which gave to Parliament a right of interference under specific circumstances. The Bill was brought forward as a notice to the numerous railway projectors seeking the sanction of Parliament for their projects, that, after the lapse of a certain period, Parliament shall have the power to deal with their charters, and to determine whether any alterations will then be necessary for the public convenience. "We are about to deal with railways," he said, "in the same way as we deal with the Bank Charter. You have given them a charter by which they enjoy a monopoly, but you have given Parliament the power to deal with them, if they think fit, after the lapse of twenty years—so with the East India Company, you give a limited duration to their charter, and you give Parliament the power of reconsidering the compact you have made with them. It is the same thing with railways. We do not say that purchase is desirable, but we do not intend them to have a permanent monopoly against the public, but in after years they shall be brought under certain limits, if Parliament should think fit to interfere." To make the Bill conformable to the recommendations of the third report of the commission was his object, and he was ready to agree to such amendments in committee on the Bill as would conduce to that end.—Mr. WARD regarded the Bill as the first step in establishing a gigantic system of Government monopoly. —Mr. GLADSTONE disclaimed all wish, on the part of the Government, to dogmatise.—Mr. HAWES attacked the conduct of the supporters of the Railway Bill, which he considered subservient to the interests of monopoly.—Mr. MUNTZ was fearful that the Bill would operate unfavourably against existing railway speculations.—Mr. S. CRAWFORD expressed his approbation of the Bill, and thanked the Government for bringing it in.—On a division, the second reading was carried by 186 to 98; majority, 88.—Some further discussion ensued, during which Mr. GLADSTONE disclaimed all wish, on the part of the Government, of going beyond the recommendations of the third report of the committee on railways. The Bill was then read a second time.—The South Wales Turnpike Trusts Bill was read a second time.—The reports of the Actions for Gaming Discontinuance Bill, and of the Sudbury Disfranchisement Bill, were received.—The committee on Dog-stealing was nominated, after an unsuccessful division on a motion for adjournment.

Friday.—On the order of the day being read for the further consideration of the Great Southern and Western Irish Railway Bill on its third reading, Col. RAWDON moved that the 163d clause be omitted from the Bill.—Lord ELIOT opposed the motion, and defended the clause.—A discussion ensued, in which the SOLICITOR-GENERAL, Mr. AGLIONBY, Lord G. SOMERSET, Mr. FORSTER, and several others took part. After which the motion was withdrawn, and the Bill read a third time, and passed. —In answer to a question by Mr. M. GIBSON, respecting the Brazilian tariff, which had been published in the Liverpool newspapers, Sir R. PEEL said he had seen the publication to which the hon. member referred, and had inquired at the Foreign Office on the subject, and he was therefore able to state that her Majesty's Government had not up to the present time received any official intelligence on the subject.—The Sudbury Disfranchisement Bill and the Detached Parts of Counties Bill were read a third time and passed. On the motion of Sir J. GRAHAM, the House went into committee on the Poor Law Amendment Bill, Mr. GREENE in the chair. Clauses 20 and 21 were agreed to. A discussion ensued on the 22d clause.—Capt. BERNAL moved the following amendment on this clause:—"That mayors and justices of the peace acting under the authority of an Act to provide for the regulation of municipal corporations in England and Wales, shall be *ex officio* members of the board of guardians of the poor."—Sir J. GRAHAM opposed the amendment, which, after a short discussion, was withdrawn.—Mr. BORTHWICK moved another amendment, to the effect that every clergyman having the cure of souls within the parish should be an *ex officio* guardian.—Sir J. GRAHAM objected to the amendment, and after some discussion it was withdrawn, and the clause agreed to. [Left sitting.]

CITY.

Money Market, Friday.—Consols for the account closed at 99. Red. Three per Cents. 100, Three-and-

half per Cent. Red. 102⅝. New Three-and-half per Cent. 101¾. Bank Stock 199½. Exchequer Bills 76*s.* to 78*s.*

GAZETTE OF THE WEEK.—BANKRUPTS.—C. BEAVIS, Hampshire carpenter—A. PORTWAY, Braintree, Essex, tea-dealer—J. PAGE, Devonshire-terrace, Fulham-road, builder—H. M. SHAW, Newport, Hampshire, jeweller—A. POTTER, Kidderminster, carpet manufacturer—J. CROWDER and J. GREEN, jun., Macclesfield, Cheshire, trimming manufacturers—W. COWARD, Hartlepool, Durham, baker—J. WOOD and W. NORTON, Fenay Bridge, Yorkshire, fancy cloth manufacturers—C. B. REYNOLDS, Devizes, Wiltshire, tailor—G. FRYER, Alfred-street, City-road, grocer—W. R WOOD, Brighton, dentist—F. E. C. de la MARCOTELLE, Fenchurch-street, merchant—T. G. THORNE, Southampton, builder—S. SOUTHEY, Finsbury-market and Kingsland-road, cabinet manufacturer—H. WHITTAKER, Macclesfield, Cheshire, silk-throwster—W. WEIR, Carlisle, iron merchant—T. BIGGS, Bath, woollen draper—T. GRIFFITHS, Staffordshire, tailor—W. BOND, Liverpool, victualler—J. A. FORREST, Liverpool, glass merchant.

SCOTCH SEQUESTRATIONS.—T. WHITSON, late of Blairgowrie, writer—W. LYON, Dundee, hotel-keeper—J. LINDSAY, Glasgow, slater—R. M. and J. KENNEDY, Glasgow, chemists.

Metropolis and its Vicinity.

The Irish Society.—A meeting of Irish noblemen and gentlemen was held on Saturday, the Marquess of Clanricarde in the chair, for the purpose of forming a new Society, to be called the Irish Society, for the purpose of promoting social and intellectual intercourse amongst Irishmen, irrespective of religious and political differences. The meeting was very numerously attended. Lord Castlereagh, Mr. E. Tennent, Gen. Caulfield, Sir D. Norreys, Lord Trimleston, Capt. Taylor, M.P., Mr. Grogan, M.P., and the Hon. G. O'Callaghan, and other gentlemen, moved and seconded resolutions, excluding religious and political controversy, and appointing a committee of management (comprising noblemen and gentlemen of all shades of politics) to draw up the constitution of the Society; appointing Mr. J. Hartley Treasurer, and Messrs. E. Tennent, M.P., and M. J. O'Connell, M.P., Honorary Secretaries. Mr. Hartley announced that 136*l.* had been subscribed by the noblemen and gentlemen who planned the Society, and that the subscription for members would be 2*l.* a year each. The Marquess of Clanricarde having left the chair, Mr. M. J. O'Connell moved a vote of thanks to his Lordship for the deep interest he took in the welfare of Ireland, which was carried with applause. Among a long list of the noblemen and gentlemen who have promised to support the Society were Lords Rossmore, Eliot, Bloomfield, Farnham, Cremorne, and Blaney; the Right Hon. G. Dawson, Pigott, and Shaw; Colonel Torrens, Sir T. B. Leonard, Sir R. Palmer, Messrs. Reddington, Watson, and several other Members of Parliament. In the evening about 70 gentlemen dined together at Freemason's Tavern, the Marquess of Clanricarde in the chair, supported by Mr. Tennent, M.P., Mr. Grogan, M.P., Mr. Chapman, M.P., Lord Castlereagh, &c.

The Irish State Trials.—A meeting of the Catholics of London was held on Tuesday at the Music Hall, Store-street, for the purpose of adopting an address of sympathy to Mr. O'Connell and his fellow traversers. Mr. J. A. Cooke took the chair, supported by the Rev. Mr. Moore, Rev. Mr. Phillips, Rev. Mr. Chapman, and many lay gentlemen of the Catholic body. Resolutions in accordance with the object of the meeting were carried, and a deputation was appointed to go to Dublin and present the address to Mr. O'Connell.—The address adopted by the meeting in Covent Garden last week has also been adopted at Liverpool, where Mr. F. O'Connor has held a meeting for the purpose of effecting a union between the English Chartists and the Irish Repealers.

The Waverley Ball.—On Monday night a ball was given at Willis's Rooms, under very distinguished patronage, for the purpose of raising a fund to add to the general subscription for the completion of the Scott Monument in Edinburgh. The chief feature of this ball was the idea of embodying in a fancy ball the leading characters of Sir Walter Scott's novels and poems. The object, both in regard to the costumes and to the success of the experiment was fully gained, no less than 1438 tickets having been entered, so that upwards of 1000*l.* will be added to the Monument fund. The event of the evening was the "monster" quadrille, arranged by the Marchioness of Londonderry, in which no less than 42 couples danced in appropriate costume. The Duke and Duchess of Cambridge, the Duchess of Gloucester, the Hereditary Grand Duke of Mecklenburg Strelitz, and the Duke of Wellington, were among the numerous company.

Post Office.—The *Atlas* states that the description given by a Liverpool paper of the mode of opening the seals of letters by a plate of lead struck smartly by a machine is incorrect. The operation, it says, is much simpler; and by the process adopted at the Post-office a score of spurious seals can be produced in a few minutes, and with the utmost precision and certainty. The spurious seal by which it is intended to reseal the opened letters, is taken in plaster of Paris, and with so much accuracy as to defy detection. It appears that in the secret or inner bureau of the Post-office, the appropriate apparatus for casting is always in readiness. It simply consists of a small cylindrical, annular brass mould, about an inch in height, which opens and shuts like a bullet-mould. After the seal has been oiled, to prevent the plaster adhering, this mould is placed upon it, and the plaster of Paris, mixed in the usual way, is poured into it. In about five minutes it hardens, or *sets*, as it is technically called; and in about as many minutes more is fit for resealing the letter, which has been opened by the application of a hot iron to the seal. If a wafer has been used, a little hot water or steam is used to remove the obstruction.

The Loss of the Manchester.—By the arrival of the Duchess of Lonsdale with the Hamburgh mail, it is ascertained that the wreck of the Manchester, which was discovered lying at the extreme end of the Reissen Sands, north of the Elbe, in about 12 feet of water, has gradually disappeared. Two bodies, one a female and the other a male, have been cast on the beach, and are supposed to have been part of the unfortunate persons who perished with the vessel. Mrs. Smith, of Drogheda, her daughter, and the stewardess, were the only females that were on board at the time, and it is presumed that the body is one of them. It is said that there are considerable doubts whether the vessel was lost on the end of the Reissen Sands, where her wreck was seen, as her anchors and chain-cable, which, from their massive description, would not drift, were not found on the spot, and it is considered a singular circumstance that she was lying in 12 feet of water, the extent of her draught when laden. It is, however, regarded as certain, that the primary cause of the loss was her going too far north of the harbour.

Burning of the Madras Transport Ship.—On Monday morning, shortly after midnight, a fire broke out on board the East India ship Madras, 500 tons, lying at anchor in the river off Deptford Dockyard. The ship has recently been chartered by Government for the conveyance of stores and ammunition to Hong-Kong. She had partially received her cargo, and was moored alongside the Tory transport vessel, the only persons on board being the mate and boy. As soon as the fire was discovered, the floating engine was got into play, and the hatchways were torn up, when it was discovered that the fire was raging furiously in the hold, fore and aft, and the destruction of the vessel appeared inevitable. The engines having little or no effect upon the flames, the ship was cut away and hauled more into the centre of the river, where operations were forthwith commenced to scuttle her. Before that, however, could be accomplished, owing to the strength of the tide, she broke adrift and was carried athwart the fleet of steamers belonging to the General Steam Navigation Company, and a number of Dutch galliots. The confusion and alarm that immediately followed was very great, but ultimately the Madras was got clear and sunk in the middle of the river, the tide just sweeping her decks. The extent of mischief done to her, in addition to her stores being consumed, is very considerable. The vessel belonged to the captain, who is insured. She was to have received 400 puncheons of rum in the course of the day. In the course of a few days attempts will be made to weigh her by chain lighters. The Madras was built at Whitehaven, in 1827, and has recently returned from Swan River and Port Adelaide.

Loss of an Emigrant Ship.—Intelligence has been received from Sydney, Cape Breton, announcing the loss of the Sir George Prevost emigrant ship on a reef of rocks to the westward of Gaberus. But for the moderate state of the weather this wreck might have terminated in a fearful loss of human life, as there were upwards of 160 souls on board. The vessel, which was 690 tons burthen, left Newry, in Ireland, early in the present year, with emigrants and a miscellaneous cargo. The voyage across the Atlantic was as favourable as could be expected, but on nearing the coast off Gaberus on the 31st of May, it came on a dense fog, so that it was almost impossible to discern anything beyond the vessel. Instead of being brought to an anchor, the ship was allowed to continue her course, and about 9 o'clock she struck. Guns of distress were fired, and two vessels which were near the spot succeeded in saving all hands and conveyed them to Arichat. They were, however, in great distress, as all their property was on board, and the vessel soon became a total wreck.

New Royal Exchange.—The ground between the eastern front of the New Royal Exchange, at the rear of the houses in Finch-lane, is being now built upon by direction of the trustees of Magdalen College, to whom the property belongs. There will be a line of houses from Cornhill to Threadneedle-street, for which purpose the church of St. Benet Fink will be pulled down, the living of which it is said will be transferred to a church which will be erected on the site of what was formerly Cripplegate Workhouse, Moor-lane. In excavating for the foundation of the new houses, at a depth of about 12 feet, a large quantity of common Roman and of Roman tessellated pavement was found.

The Chinese Ransom.—On Friday, a special train on the South-Western Railway arrived at Nine Elms, containing nine tons and a half of Sycee silver, which had been brought from Portsmouth, under convoy of a detachment of the 47th Reg. This specie is part of the money agreed upon by the Chinese Government to be paid to this country for the ransom of Canton, and arrived at Portsmouth a few days ago, in H.M.S. Wanderer. The specie was conveyed in seven artillery vans to the Mint.

The National Gallery.—On Monday two pictures purchased on Saturday by Mr. Eastlake, R.A., the Curator, at a sale at Messrs. Christie and Manson's, for the National Gallery, were placed in that institution, and were greatly admired by the numerous visitors. They are numbered 193 and 194, and are placed in different rooms; the "Judgment of Paris" being in the second large room, and immediately facing Rubens's "Rape of the Sabines." This picture, it was stated at the sale on Saturday, was painted by Rubens for Cardinal Richelieu; and was subsequently in the Orleans Gallery, from which it was brought and sold to Lord Kinnaird, who gave 3000 guineas for it. It afterwards came into the possession of Mr. Penrice, of Great Yarmouth, at whose sale of pictures on Saturday it was bought for the Nation at 4000 guineas. The other picture, by Guido, of "Lot and his Daughters," is placed in the large room, in the north-east corner. This picture was formerly in the Lancilotti Palace, at Rome, and was brought from Rome by the second Marquess of Lansdowne. In addition to the above, the National Gallery has recently been enriched by three new pictures, purchased at the sale of the late Mr. Harman's collection. They are numbered 190, 191, and 192, and consist of the Portrait of a Jew, by Rembrandt; the "Infant Christ and St. John embracing," by Guido; and an exquisite little portrait of Gerard Dow, painted by himself.

The Duke of Sussex's Library.—On Thursday the sale of that portion of H. R. Highness's library which comprised the Bibles and Testaments was brought to a close. The number of lots disposed of amounted to 2074, and the number of Bibles to 1009; of these, 294 were English, 259 Latin, 79 French, 26 Greek, 80 German and Flemish, and 176 in various languages. The number of New Testaments disposed of was 610; of these 227 were Greek, English 73, French 61, Latin 51, and in various languages 198. The remainder of the lots disposed of consisted of Psalters and portions of the Scripture in almost every tongue. The sale of the "Theological" works of ancient and modern writers commenced yesterday, and will continue for 14 days, at the close of which the splendid collection of manuscripts, some dating as far back as the ninth century, will be sold.

University College.—At a session of the council on Saturday, the three undermentioned gentlemen, formerly students of the college, who had graduated with honours at the University of London, were admitted members of the corporate body of this college, under the title of "Fellows," and had shares conferred them, viz.:—F. W. Mackenzie, M.D.; J. G. Greenwood, B.A.; and C. J. Hargreave, B.L., Professor of Jurisprudence. We understand that Mr. John Ellerton Stocks, of Hull, has proved the fortunate gainer of the Assistant-Surgeoncy in India, placed by Martin Smith, Esq., at the disposal of the Council of this College, "as a reward for proficiency in the study of Medicine and Surgery." Mr. Stocks had previously gained the Silver Medals in Anatomy, and Physiology and Botany, in the College examinations, and the Gold Medal in Botany at Apothecaries' Hall.

The Exhibition in Westminster Hall.—The success which has attended the exhibition of the works of sculpture and specimens of fresco paintings recently opened in Westminster Hall, has far exceeded the most sanguine expectations of the commissioners, and affords satisfactory proof of growing taste for the Fine Arts among the people generally. During the first week of the exhibition, the weather was extremely unfavourable, notwithstanding which the hall was never so poorly filled as during the same period of the cartoon exhibition last year. The attendance since Monday last has been still more numerous, and the result altogether is satisfactory. On Wednesday Prince Albert presided, for the last time this season, at a meeting of the Commissioners at Gwydyr-house, on which occasion some important arrangements in connexion with the subject of Fine Arts were unanimously agreed to. Among these, it is said that the Commissioners have judged it right, after a careful examination of the specimens of fresco paintings sent in for exhibition by the various artists, to select six individuals from among the whole number, and to commission them to commence works on given subjects immediately. The Commissioners, however, unwilling to confine the practice of the art to a few hands, have agreed to invite the competition of other artists not included among the six selected individuals, under conditions which are not yet finally determined on. The names of the six artists have not yet transpired, but they will be no doubt made known in the course of a few days. The exhibition will be thrown open to the public gratuitously on Monday next.

The Convict Dalmas.—It is now stated that the reprieve in the case of Dalmas has been granted solely on the ground of insanity. The report of Doctors Monro and Sutherland, who were appointed to examine the state of the convict's mind was so positive on this point as to leave no alternative to Sir J. Graham.

The Wills Forgeries.—In consequence of the declarations of the convict Fletcher respecting the innocence of Barber, the convict ship was detained at Woolwich until the case could be thoroughly investigated. She sailed from the river on Monday, having both these convicts on board; and it is, therefore, presumed that the result of the inquiry was unfavourable. Barber, however, has since written a long letter to the *Times*, protesting his innocence, and expressing regret at the manner in which his counsel conducted the trial, as there was ample evidence, he says, to establish that he had no guilty knowledge of the forgeries of his clients. The convict Sanders, who is on board another convict ship, has made a declaration similar to that of Fletcher, which was forwarded to Sir J. Graham by Barber's solicitor on Thursday. He says:—"I am desirous of reiterating all my former statements of my firm belief and conviction of the complete innocence of William Henry Barber of any participation or guilty knowledge whatever of the late transactions in which I or my wife, Lydia Sanders, were concerned, or that he received one farthing more than his professional remuneration. William Henry Barber was an utter stranger to me until introduced to him by Joshua Fletcher, as Thomas Hunt, nor did I after see him, or have any subsequent communication with him, until my examination at the Mansion-house. I make this declaration from an unfeigned desire of doing all the justice that in my power lies to one whom I have been instrumental in placing in a position, of the horrors of which I am now too painfully acquainted."

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending July 6.—West Districts, 156; Northern, 165; Central, 160;

Eastern, 166; Southern, 224; Total, 871. Weekly average for the last five years, 946.

Provincial News.

Bedford.—Our readers are aware that in September last the Bedford coach was robbed on its way to London of a parcel containing 1100*l.* in bank notes and bills of exchange, which had been forwarded from Mr. Barnard's bank for Sir C. Price and Co., the London agents. For a a long time the affair remained undetected, but about six weeks back a man was found uttering some of the lost notes in Dunstable. He was apprehended, and on Wednesday was tried in the sessions court. He was found guilty, and sentenced to seven years' transportation.

Bolton.—The Jury at the Coroner's inquest on the persons killed by the late explosion at Alderman Brooks's mill, have returned a verdict that their death was caused by an explosion of the steam-boiler, caused by the pressure of steam being too great; that the engineer caused the explosion; and that due care had not been used in the general superintendence of the steam-engines and boilers. George Branscombe, the engineer, was thereupon committed to take his trial for manslaughter.

Frome.—The Hon. Caroline Boyle, niece to the Earl of Cork, and Maid of Honour to the Queen Dowager, had a narrow escape from drowning last week, at Allarston, the noble Earl's seat, near this town. It appears that Miss Boyle was on a pleasure excursion on the lake, and when pushing off among some willows she lost her footing, and fell from the boat, where the water was 16 feet deep. Miss Boyle clung to the boughs, and Miss Warburton, her companion, threw her the end of an oar. Miss Mary Boyle, who had been waiting the arrival of the boat at the further end of the lake, alone unmoored the boat, and, assisted by Miss Warburton, succeeded in dragging in Miss Boyle, just as her strength was giving way, and her hands were relaxing their hold.

Halsted.—The Chelmsford papers of yesterday contain accounts of the fall of the tower of Halsted new church, just erected by voluntary subscriptions, and which was to have been consecrated on the 31st inst. by the Bishop of London. It appears that on Wednesday afternoon the tower and steeple, which had been completed to a height of 115 feet, fell with a crash which must have been heard for miles round. The first impression was that all the labourers were beneath the ruins, and the shrieks and screams of the women and children were dreadful. Fortunately however this was not the case. It appears that Mr. Johnstone, the builder, saw the tower sinking, and immediately ordered the workmen off, when the tower fell; only two labourers were then upon the scaffold, one of whom is severely injured, the other is but slightly hurt. Archdeacon Burney and G. Sperling, Esq., had a narrow escape, as had also Mr. and Mrs. Arden, who were in the body of the church at the time of the accident, a portion of the ruins falling into that part of the structure. The church itself has received but little injury, and only such as may speedily be repaired.

Leeds.—The trial of the military and civilians concerned in the recent riots in this town appears to have been an extraordinary event. It occupied four days of the borough sessions, and twice as long as the other 36 cases put together. The speeches of counsel alone occupied about 12 hours. The Recorder was nearly 6 hours in summing up, and the Jury occupied three hours in the consideration of the verdict. Of the military, four were found guilty, and eight not guilty; of the civilians, four guilty, three not guilty. The sentences on the former were different periods of imprisonment; of the latter, one was fined 4*l.*, the others were sentenced to short periods of imprisonment.

Newcastle.—The pitmen's strike has now continued upwards of three months, and is yet without any certain indication of a speedy termination. The coal-owners are unanimously determined to resist the demands of their late workmen; and at a delegate meeting held in this town last week, it was resolved unanimously that the strike should be maintained "a little longer," in the vain hope that the coal-owners will at length give way. The owners are using great exertions to supply the places of their late workmen, by introducing other parties from a distance; and several hundred Welshmen have been imported into the district, and distributed among the various collieries, according to the extent of their workings. These men receive liberal wages, and great encouragement from their masters, so that there is every reason to believe they will be well satisfied with the change. The "turn-outs" are suffering the greatest hardships, and the pawnbrokers' shops in this and the neighbouring towns are daily resorted to in order to raise the means of alleviating actual starvation.—The local papers state that such is the competition with the steam-vessels between this port and London, that the fare has been reduced to 2*s.* 6*d.* for deck passengers, and some have actually been taken down for 1*s.*!

Portsmouth.—The report noticed in our last respecting the intention of Government to send a squadron to the coast of Morocco to watch the proceedings of the French squadron under the command of the Prince de Joinville, and to protect the British interests in that quarter, was confirmed on Friday evening by the statement of Lord Aberdeen in the House of Peers, in reply to Lord Minto. The Caledonia, 120, Capt. Milne, flag-ship at Plymouth; the Albion, 90, Capt. Lockyer, flag-ship at Cork; and the St. Vincent, 120, flag-ship at Portsmouth, have already been despatched. The Camperdown, Capt. Martin, 104, flag-ship at Sheerness, or the Queen, 120, late flag-ship at Malta, will follow in a few days should they be required. Despatches have been sent to Sir Edward Owen, Commander-in-Chief in the Mediterranean, to proceed in the Formidable, 84, to Gibraltar and the coast of Morocco. The Cyclops steam-frigate, Capt. Lapidge, at present in the Shannon, is under orders to hold itself in readiness to proceed to the coast of Morocco, and will be one of the first steamers despatched from the Irish squadron to that quarter, in the event of necessity.

Romford.—On Monday week the bankrupts, Messrs. Thomas and William Johnson and C. Mann, underwent a private examination before Mr. Commissioner Goulburn, that of Alderman Johnson occupying about two hours, and an adjournment then took place. The sheriff's gold chain, which cost 80 guineas, was given up to the assignees, who intend, it is said, to receive further proofs at the bank on the 24th inst. Four individuals in the neighbourhood of West Ham lose upwards of 7000*l.* by this failure.

Sheffield.—On the night of Saturday week, a stack of oats, supposed to contain about 50 qrs., the property of Lord Wharncliffe, was fired in five places in the stack-yard at Wortley-hall. It was the centre one of three stacks, having one of hay and one of wheat on either side of it, at about 20 yards' distance. The fire-engines from Sheffield, with a body of police, prevented the flames from communicating with the stacks adjoining. Every inquiry was made as to whether any strangers had been seen in the neighbourhood, but no clue whatever could be obtained towards the discovery of the incendiary. A strong suspicion exists in the neighbourhood that it was the act of some misguided collier, while others attribute it to political animosity. Lord Wharncliffe was insured.

Salford.—On Sunday night, a man named Thomas Stew, an excavator, murdered a respectable young woman named Alice Nolan, who was employed in a factory, by cutting her throat on Shaw's Brow, in this town, and afterwards attempted to commit suicide by cutting his own throat. The young woman had excited his revenge by persisting in her refusal to marry him. It is said that a case of a similar kind, in which a young girl to whom he had been paying his addresses disappeared in a mysterious manner some months ago, will be brought against the prisoner if he recovers from his wound.

Worcester.—Jabez Hooper, the man who recently murdered his nephew in this city and attempted to commit suicide, died about a week since from the effect of his wound. The Jury at the inquest returned a verdict of temporary insanity.

York.—York Minster was re-opened on Friday week last, after having undergone a complete restoration. Dr. Cockburn, the dean, preached on the occasion.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1585*l.*; Birmingham and Gloucester, 2925*l.*; Eastern Counties, 4529*l.*; Edinburgh and Glasgow, 2124*l.*; Great Western, 17,317*l.*; Grand Junction, 8751*l.*; Glasgow, Paisley, and Ayr, 1411*l.*; Great North of England, 1730*l.*; London and Birmingham, 18,140*l.*; South Western, 7277*l.*; Blackwall, 1413*l.*; Greenwich, 846*l.*; Brighton, 4000*l.*; Croydon, 527*l.*; Liverpool and Manchester, 5159*l.*; Manchester, Leeds, and Hull, associated, 6897*l.*; Midland Counties, 3141*l.*; Manchester and Birmingham, 3244*l.*; North Midland, 5205*l.*; Newcastle and Carlisle, 1901*l.*; South-Eastern and Dover, 4999*l.*; Sheffield and Manchester, 625*l.*; York and North Midland, 2054*l.* The fluctuations in railway shares must be of importance to all those who have selected that form of investment. In the large provincial towns, where this species of property is dealt in almost as regularly as it is in London, the brokers have adopted the plan of drawing out returns for six months past in a tabular form, exhibiting not only the variations in price, but also in traffic, dividends, &c., and giving at one view their entire history and present position. The following account of the fluctuations is taken from a list printed by Messrs. Collinson and Flint, of Hull:—

	July 1.	Jan. 1.
Birmingham and Derby	63 to 65	56 to 58
Birmingham and Gloucester	93 to 94	64 to 66
Edinburgh and Glasgow	62 to 64	58 to 59
Grand Junction	221 to 223	227 to 229
Great North of England	100 to 102	84 to 86
Great Western (half shares)	78 to 7[illegible]	69½ to 70½
Liverpool and Manchester	223 to 225	228 to 230
London and Birmingham	218 to 220	235 to 237
London and Brighton	46 to 46½	42 to 43½
London and South Western	82 to 84	75 to 76
Manchester and Birmingham	55 to 56	39 to 40
Midland Counties	93 to 95	86
Newcastle and Carlisle	90 to 92	75½ to 76½
York and North Midland	104 to 106	119 to 121

Thus it appears that the greatest advance, that of 29*l.* per share, has occurred on the Birmingham and Gloucester line, and that the greatest fall, that of 17*l.* per share, has occurred on the London and Birmingham line.—Deputations from the boards ofdirection of the London and Birmingham and Grand Junction Companies met at Birmingham on Wednesday week, for the purpose of arranging the difficulties which have recently arisen between them, and the chairman of the Liverpool Stock Exchange announced on Thursday, that the deputations had come to a complete and amicable understanding. The immediate effect was an increase in the value of the respective shares to the extent of 5*l.*, with the prospect of a further improvement.—On Friday the first meeting of the Guildford Junction Company was held at the Hall of Commerce, Mr. Mangles, M.P., in the chair. From the report of the directors it appeared that all the shares had been taken, the purchases of land requisite for the line had been made, and a contract entered into for its construction. The purchase of land had been within the estimate. The contract of Messrs. Tredwell had been accepted, who had agreed to complete the line and have it opened by the 1st May, 1845. It appeared from a conversation between the chairman and proprietors, that the quantity of 72 acres had been purchased at a cost of 5440*l.*, and that the total cost of the whole line of six miles from Guildford to Woking, would be only 55,000*l.*—The Bristol and Gloucester Railway was opened to the public on Monday.—Great excitement prevailed at the Brighton terminus on Monday, by the non-arrival of the last train from London, and after the lapse of about half an hour a pilot-engine was despatched up the line to ascertain the cause. It appears that when near Hayward's Heath Station, one of the tubes of the boiler burst, and the train was enveloped in steam. A messenger was despatched up the line for an engine, but before he returned the pilot from Brighton arrived, and propelled the train for the remainder of the journey, after a delay of an hour. No one was injured by the explosion.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday, in Conciliation-hall. Mr. Roche, M.P. for the county of Cork, having been called to the chair, proceeded to address the meeting at some length. He stated, that having been from early youth a steady and ardent Repealer, he could not but feel highly the honour conferred on him on that his first appearance among them, at a trying time, when the fate of Ireland was in the hands of the people. After praising the working of the committees of the Association, he called on the people to aid them in their exertions as regarded registration of voters, in order that when the opportunity arrived they might be able to return men to Parliament who would not be ashamed to serve their country and denounce her oppressors. He stated his disapproval of the proposition made to force the repeal pledge from those members who had been returned to Parliament unpledged. They understood the value of sincere conviction too much to interfere with those gentlemen until the next election, when they could return those only who would faithfully represent their principles and opinions, and this could alone be effected by paying strict attention to the registrations. Mr. O'Brien said, that he had received by post that morning upwards of 500*l.* from various localities, and proceeded to read the names of the contributors. Mr. M. O'Connell, M.P., handed in several sums of money from the London Repeal wards. He could bear testimony to the excellent organisation of these wards, for he had attended, on Tuesday night, a meeting of "the Liberator's" ward, in Rotherhithe, at which upwards of 2000 persons attended. They were nearly all teetotallers, and all of them were Irishmen—men who, for thews and sinews, would be remarkable among millions. They were men who would delight the eyes of a recruiting sergeant, most of them being six feet high, and many not far from six feet across the shoulders! They were composed of the labourers, the ballast-heavers, and coalwhippers of the metropolis—that industrious class of men who undertook and carried out the labour deemed too severe for the delicate citizens of London, and the tenderly-reared inhabitants of Scotland. There was but one heart and one mind among them, and that was for repeal. As an evidence of the improvement which had taken place in their habits he need only mention a fact which had come to his knowledge—namely, that on last Patrick's-day but one man was taken up for drunkenness in Rotherhithe, and that person was an Englishman. Mr. W. J. O'Connell followed in a speech which excited much laughter, as well from the extravagance of the sentiments as the rich brogue in which they were delivered. Dr. Nagle read a declaration from a person named Hudson, who had been refused medical aid in the Meath Hospital, Dublin, because he refused to remove a repeal button which he wore in his coat. Mr. O'Neill, of Eunowen Castle, moved, and Mr. H. Grattan, M.P., seconded a motion to the following effect:—"That we recommend Irishmen of all classes to meet in their respective parishes throughout Ireland, on the 30th day of each succeeding May, being the anniversary of the imprisonment of the most successful champion of civil and religious liberty throughout the world—O'Connell—and of his associates, all of whom are unconstitutionally charged with a conspiracy against the peace and welfare of their fellow-subjects, but who gloried in the true accusation that they had stimulated the people of Ireland to demand their rights, and to achieve peacefully the legislative independence of their native land." Mr. D. O'Connell, jun., read an address which his father had received from the priests of the college of "Bitche," in Moselle, from which the following is an extract:—"Courage, great O'Connell, we all envy you your prison. With the faith which characterises you, and which is the joy and pride of your friends, you will hurl the mountains into the sea. A cause so holy can never perish, and engages the sympathies not only of all Catholics, but of all the honest men in the world." Mr. W. S. O'Brien, M.P., read a report from the Parliamentary committee of the Association, stating their opinion that the renewal of the Party Processions Act ought to be opposed; that the Charitable Bequests Bill ought also to be opposed as unduly and insidiously interfering with the internal administration of the Catholic Church in Ireland. The report also recommended opposition to the re-enactment of the Acts relating to the removal from England of poor persons born in Ireland and Scotland; and that the Coroners' Bill and the Grand Jury Presentment Bill for the county of Dublin, should be postponed till next session.—Mr. M. O'Connell, M.P., handed in 31*l.* from Liverpool, and 68*l.* from Jersey city, United States, and brought forward a motion founded on the first clause of the preceding re-

port, calling on their friends in the House of Commons to oppose the renewal of the Party Processions Act, as being inoperative to produce the effect intended by its enactment, and to show the Orangemen of the north that the members of that Association were averse from any attempt to curtail what the Orangemen conceived to be their privileges. He called on Orangemen to reciprocate, and to join the Association in their efforts to oppose, not only Processions Acts, but every piece of legislation calculated to abridge the liberties of their common country. The motion was seconded by Capt. Seaver, of Newry, and adopted. Mr. D. O'Connell, jun., gave his usual weekly account from the prison, and he had again to announce that his father and fellow-prisoners were in the highest health and spirits. Indeed their health appeared to improve the longer they were confined. His father wished him to express to them his delight at the peaceable conduct of the people, and now that there was no danger of a breach of the peace he had nothing more to say to them than persevere, persevere. They were advancing nearer to Repeal every day, for England would soon want them, unless they wished to see France take possession of Morocco. When Irishmen were not wanted they were insulted and trampled on, but when their services were required they were addressed as "Good brave Pat, you are fond of fighting for fighting sake, and you must become again what you have ever been—the right arm of our power.' Would they grant that request if they ask them? (Cries of "Never.") Yes they would, but they should first get a little bribe in the shape of a domestic Legislature. They would then have something worth fighting for; but now they got all the kicks, while England pocketed the halfpence. The amount of rent was 2136*l*.

Miscellaneous.

Pilgrimage to the Tomb of John Ray.—The *Chelmsford Chronicle* of Friday last contains an interesting account of a pilgrimage made on Wednesday, the 3d inst., to the tomb of John Ray, the naturalist, at Black Notley, Essex, by the President and several Fellows of the Linnean Society. We regret that we have not room for the detailed account of the visit, but the following extracts will interest many of our readers. The party left town by the first railway train on Wednesday for Witham, consisting of the Bishop of Norwich, president of the Linnean Society; Professor Bell, of King's College; Professor Forbes, of King's College; Professor Ansted, of King's College; Robert Brown, Esq., F.R.S.; Edward Forster, Esq., F.L.S.; J. J. Bennett, Esq, F.L.S.; R. Kippist, Esq., F.L.S.; Dr. Lankester, F.L.S.; C. Harrison, Esq. (Private Secretary to Sir R. Peel); Richard Taylor, Esq., F.L.S.; J. E. Winterbottom, Esq., F.L.S., M.A.; R. H. Solly, Esq.; W. Yarrell, Esq., F.L.S.; A. White, Esq., F.L.S.; Joshua Milne, Esq., and J. Van Voorst, Esq. At Witham the party were joined by J. H. Pattisson, Esq., who being the proprietor of the house in which Ray spent his last days, invited these gentlemen to take luncheon beneath its roof. They were also joined by Thomas Luard, Esq., J. W. Tomkin, Esq., and by three gentlemen from Saffron Walden, Thomas Spurgin, Esq., and Joseph and Joshua Clark, Esqrs., the latter of whom, in conjunction with Mr. G. S. Gibson, has published in the pages of the "Phytologist" an account of a pleasing botanical trip to the same spot. Mrs. Pattisson and the Misses Luard were also present. Proceeding in carriages to Black Notley, about six miles distant from Witham, the party reached the village church about 12 o'clock. This edifice is an old plain tiled building, with rather a picturesque wooden spire, and stands in a delightfully rural situation. On the south side of the church rest the mortal remains of one of the greatest of British naturalists. The tomb is of a pyramidal form, from 10 to 12 feet high, and is inscribed with an elegant Latin epitaph from the pen of the Rev. W. Coyte, M.A. It is in good preservation, but the inscription is rather illegible, and we understand that the Linnean Society intend to restore that portion of it; and thus, like Old Mortality with his pious chisel, preserve it for future enthusiastic inquirers after the "lettered stone." This monument was of course the chief object of interest and attraction, and many lingered for a considerable time round it, several copying the inscription while Professor Forbes took a clever sketch of the scene. Many of the party visited the interior of the church in which Ray had been baptised—rambled about the village—or culled botanical specimens as an appropriate memento of their visit. The Bishop of Norwich appeared to take especial interest in the scene, but was obliged to leave early, and after visiting Ray's residence, and partaking of Mr. Pattisson's hospitality, he proceeded to Witham to take the train to London. About one o'clock the party assembled at Dewlands, the house from which Ray's pure spirit took its final flight in 1705. It is now a farm-house, occupied by Mr. Wakeling. Here they sat down to a cold collation, provided by Mr. Pattisson, and at which that worthy gentleman and his lady presided. Mr. Pattisson proposed that they should drink to the memory of John Ray, which was done in reverential silence. Mr. Forster then proposed the health of Mr. and Mrs. Pattisson, with many thanks to them for their kind hospitality. He alluded to the pleasure and satisfaction which he experienced at his present visit, entertaining, as he always had done, the highest veneration for John Ray, both as a scientific and a moral character. He said he could not better express his view of Ray's character than by repeating what he had remarked of him at the last anniversary of the Linnean Society—that he possessed piety with sincerity and without cant, and morality with consistency. When at Cambridge such was his goodness of disposition that he gained the respect of all parties. Several other toasts followed, including that of the Bishop of Norwich, as President of the Society. On their return to Witham the visitors and their friends sat down to dinner at the White Hart Inn, Edward Forster, Esq., V.P.L.S., in the chair, R. Taylor, Esq., acting as Vice-President; and after dinner returned to town by railway. We must not omit to mention that the party assembled at Dewlands, before they separated, recorded their signatures in a work belonging to Mr. Pattisson, "Derham's Life and Remains of Ray," which will doubtless be treasured by that gentleman as an interesting memento of the visit.

Piracy and Murder.—Accounts have been received by the Caledonia steamship from Halifax of the wreck and piracy of the barque Saladin, under very horrible circumstances. It appears that the Saladin, bound to London from Valparaiso, had been run on shore and wrecked near Country Harbour, on the coast of Halifax, under circumstances that gave strong grounds for suspicion that an act of piracy had been committed; and Admiral Sir C. Adam at once sent one of her Majesty's ships to take possession of the wreck, and apprehend the crew. The Admiral in his report states that "upon the examination of the prisoners (six in number), it was apparent that there were the strongest grounds of suspicion, and they have all since confessed that at the instigation of a man named Fielding, who was formerly master of a ship which had been seized at Valparaiso, and who was a passenger on board, the master, two mates, and three others of the crew were murdered. That Fielding and his son, a boy of 15, were afterwards put to death, in consequence of an attempt on his part to get rid of two men who had been the principal actors in the murder of the master and others, and that the ship was run on shore as already mentioned. It is intended to admit two of the six men who were not all engaged in the murder of the master and crew as witnesses, and bring the other four prisoners to trial." The confession of one of the crew details the whole proceeding at great length; but all the principal facts are given in the above extract from Sir C. Adam's letter. The vessel had on board a valuable cargo of copper in bars, 13 bars of silver, 10,000 dollars, and a quantity of guano.

The New Comet.—M. Arago announced, on Monday last, to the Academy of Sciences, that M. Mauvais had discovered in the constellation of Hercules a nebulosity which he suspected to be a comet. The observations made on Monday night fully confirmed that supposition, and the new comet had already been seen in two different positions. Its apparent position at midnight, at Paris, on the 9th inst., was A.R.=216° 47′ 8″.6 and Dec.=45° 55′ 59″.4; with a daily motion in A.R. of 1° 34′ 31″, and in Dec. of 0° 25′ 9″.

Law.

HOUSE OF LORDS.—*The Sussex Peerage.*—A Committee for Privileges assembled on Tuesday to hear the opinions of the Judges on the claim of Sir Augustus d'Este to the Peerage.—Lord Chief Justice Tindal said: My Lords, the question proposed by your Lordships to her Majesty's Judges is:—"Evidence was given of a marriage in Rome in the year 1793, performed by an English priest, according to the rites of the Church of England, between A B, a son of George III., and C D, an English subject, without the previous consent of his Majesty. Assuming such marriage to be sufficiently established so as to be a valid marriage, but for the provisions of the Royal Marriage Act, would it, notwithstanding this act, be sufficient in a suit by the son of A B to recover an estate in England as heir to his father?" In answer to that question, I have been requested by my brethren to inform your Lordships that it is the unanimous opinion of all the Judges that, assuming the evidence offered of a marriage solemnised at Rome in 1793, according to the rites of the Church of England, between a son of the late King and another British subject, without the previous consent of the King, it is not sufficient, having regard to that statute, to establish a valid marriage between those persons in a suit in which the eldest son of that marriage claims an estate in England by virtue of such marriage. The question turns upon the statute, and is shortly this, whether, bearing in mind the provisions of the statute, if a marriage should be contracted within the realm of England, and would be on account of such statute null and void to all intents and purposes, such statute would have the effect of annulling such marriage whether celebrated within this realm or without. It is hardly necessary to observe that, as your Lordships' question states, A B was the son of his late Majesty George III., and as the statute expressly applies to the descendants of the body of the late King George II., not being the issue of a princess married to a foreign prince, A B does, in our opinion, fall precisely within the class of persons expressly described in the statute, and therefore we must consider him in the same situation as if the act had been passed with regard to him individually. So that it seems to us as if it had been declared by the statute that A B should not marry except under certain circumstances; and again, that the marriage of A B not under those circumstances, that is, without the consent required by that statute to be obtained from the Crown, should be null and void to all intents and purposes. The rule of construction with regard to all statutes is, that there should be a construction according to the intent of the Parliament which passed the act. If the words of a statute are unambiguous, then we have nothing more to do than to take the words of the statute themselves, and construe them according to their ordinary and natural meaning. The words themselves declare the intention of the Legislature, but if doubt arises upon them, then we must call in aid the ground and circumstances of making the statute, and have recourse to the preamble, which, according to rules laid down both in Dyer and Plowden, is to be taken as the key to open the minds of those who had made the statute. Looking at all these means of interpretation, we think that they all concur in affording the construction which we feel bound to put upon this statute. But, in the first place, we must say that the words of the statute appear free from all ambiguity. The words of the statute are general, that no person therein described shall contract matrimony; and, again, that all matrimonial contracts made against the provisions of that statute shall be null and void. The effect of the act is not limited to any particular country or district, but is applied to contracts matrimonial in general, and in the abstract, and declares an incapacity to contract attaching to the person of A B wherever he goes. The incapacity to contract marriage at Rome is clearly within the provisions of the act, and is opposed to the provisions of the second section of the statute, which section declares that all marriages contracted in contravention of the provisions of the act shall be null and void. The words are general, or more properly speaking, universal, and they cannot be satisfied in any ordinary manner, unless they are held to apply to royal marriages in every part of the world in which they may be contracted. The words of the second section throw light upon, and confirm the interpretation given to the first section. [His lordship read the second section of the act.] The words simply in this section are the same as in the first; to contract marriage generally is the matter spoken of, without reference to the country in which that marriage is to be contracted. But as there is no doubt that the marriage took place without the due observance of the conditions imposed by the second section, we think that that marriage, whether contracted in Rome or in England, is a void contract. All the established rules of construction require that the words of the first and second section shall be read together, and the marriage at Rome will be valid under the second section of the statute, if it is not prohibited under the first. It is not conceivable that the Legislature should have interposed such machinery in order to enable the parties to marry under the second section without the consent to be obtained under the first, and should render such a marriage valid under any given set of circumstances if the party could have been able, by an easy journey, or by a voyage of a few hours, to render useless all the prohibitions of the first section of the statute. And it is not unworthy of remark that the exception from the prohibitory clause of the issue of those princesses who may marry into foreign families affords some proof that marriages abroad were not out of the view of the Legislature at the time of the passing of the act. Such marriages might, and, in all probability, would be celebrated out of England, and yet the Legislature thought of them and made them the subject of a special provision. It was contended at the bar, on the part of the claimant, that an act of Parliament was not generally of binding force beyond the realm of England; that even if meant to be so, it was not of force on the subjects of foreign states. It is clear that that argument is well founded; but it is equally clear that a statute will be of pending force on the subjects of this realm, both within and without it, if the Legislature has the intention to make it so, and clearly expresses such an intention. Indeed it was admitted by the counsel, in the course of argument, that if the words "within or without the realm," or any words of equipollent signification, had been inserted in the statute, the right to contract marriage, except as permitted by the statute, would have been taken away, and the marriage would have been null and void to all intents and purposes. But if the words are comprehensive enough to include all persons of a certain class, within and without the realm; and if the same restraining sense of these words in regard to a marriage had in England clearly applies to a marriage had out of England, then it follows that the construction must be the same, whether these words are in the statute or not. If the royal marriages could be contracted in Scotland or Ireland, or on the Continent, independently of this statute, then the statute would be virtually and substantially a dead letter, and would have been so from the day on which it was passed. We think it is not so. The object and purpose of the Legislature are clear, and the mischief to be provided against, and the means by which it is provided against, do not leave us a doubt upon this point. The statute was founded on the policy and expediency of not permitting marriages of the royal family which might be detrimental to the state. Such is stated in the preamble to be the object of the statute. The marriages of the royal family may be of the highest importance to the state. But this object might be frustrated, and the mischief intended to be guarded against might be rendered remediless, if the same marriages which, contracted within England, would be null and void to all intents and purposes, could become good and valid if they were contracted out of this country. It was then argued that this statute was merely directory—that the provision in the first section as to the signifying the consent under the great seal, and the entering it in the books of the Privy Council, showed it to be so, for that, as these provisions could only be complied with in this country, so the prohibition to marry, except under these conditions, must be confined to this country only, and could not extend to foreign countries. But the answer to that argument appears to us to be satisfactory: namely, that the only words which in this section are required to be complied with in order to render this marriage valid, are those which require the consent to be given, and that the words which follow are directory only, and not essential, and apply to those cases alone in which they can be applied properly—namely, to marriages celebrated here; for it would be impossible to contend, that if the marriage of A B at Rome was bad, with the previous consent of King George III., it would not have been good and valid, though such consent could not have been signified nor registered at Rome in the manner provided for by the statute. It was further contended that as, by the 3d section, all persons who assist at a marriage prohibited by the act should incur a *præmunire*, and as there was no provision for the taking or punishing of such an offender when the offence was committed out of the country, the necessary inference was, that the prohibition did not extend to marriages out of the realm of England. But we think that a mere deficiency in the statute, as to provision for the punishment of offenders against it, is not sufficient to justify us in holding the clear and express words of it to be useless and inoperative. We, therefore, think that the eldest son of A B, under the circumstances stated in your lordships' question, could not maintain the suit supposed, and make a good title to lands as heir to his father.—The Lord Chancellor: My lords, I think that we owe thanks to the learned judges for the care with which, amidst their other incessant and laborious occupations, they have considered and answered the question put by your lordships, and I have consulted with some other law lords, and we think that, under present circumstances, the decision of the committee had better be postponed.—Lord Brougham: I perfectly concur with my noble and learned friend, that we owe our thanks to the learned judges for their great attention, and particularly to the Lord Chief Justice, for the most lucid, and able, and convincing argument which we have just heard. I have but one doubt upon the proposition to postpone the decision, and that arises from the great expense to which the party will be thereby subjected. For myself, I am quite ready to give my opinion; I do not doubt about the question.—The Lord Chancellor: My Lords, I have no doubt whatever, from the language, the object, and the provisions of the second section, that the marriage is invalid under the act. The answer that has been given by the judges to the question propounded by your Lordships is decisive of the whole case.—Lord Cottenham: My Lords, I believe there is no difference of opinion among us that the marriage is invalid under the Statute.—The Lord Chancellor: Then, my Lords, I shall move that the committee shall declare that the claim has not been sustained.—Lord Brougham: My Lords, I agree to the motion of my noble and learned friend, on the grounds that the object of the act is clear, and the words of it are sufficient to carry that object into effect. If the words of this act had been, as were those of Lord Hardwicke's Act, insufficient to carry the object of the Legislature into effect, this marriage might have been valid. For in the General Marriage Act, which merely made marriages null, but created no incapacity to contract them, as in the case of minors, for instance, such persons by going to Scotland can defeat the purpose of the Act, and marry in spite of its provisions. If the words of the General Marriage Act had been like those of this Royal Marriage Act, we should never have heard of the case of Ilderton *v.* Ilderton. In this Act the parties are rendered incapable of marrying, and, for all British purposes whatever, their marriages are made null and void. I must say, my Lords, that I feel the deepest sorrow at being compelled to come

to this conclusion, for I do not doubt that a grievous wrong has been inflicted by the law on these parties. There cannot be any doubt among your Lordships, there cannot be any in this House or out of it, but that the feeling of every one must revolt at the consideration of this wrong. It appears to me to be of the highest justice, of the first claim, of the strictest discharge of public duty, that Parliament, which made such a law as this —which ought never to have been made—that that Parliament should give reparation to those who have been so deeply injured. —The Lord Chancellor: I have not the slightest doubt that there is sufficient evidence of a marriage in fact.—Lord Denman: The Noble and Learned Lord mistook me when he supposed that I wished this case to be postponed. I am quite ready to give my opinion upon it. I join in the thanks which have been given to the Judges for the clear and satisfactory opinion which they have laid before us, and I am happy to say that from the first my opinion agreed with that which they have now expressed, and that I have always thought that the operative words of the statute were sufficient to show that this was not a marriage valid by the law of this country.—Lord Campbell: I perfectly agree with the Noble and Learned Lord opposite, that as the evidence now stands there is a good marriage in fact, for the evidence of the Roman law satisfies me that a marriage of Protestants, according to the rites of the Protestant Church, would be valid at Rome, and would be so imagined all over the world. I own that I was surprised by such evidence; but as it stands now, it is sufficient to prove the validity of the marriage there. It was competent to the Legislature to make this act, and thus to affect the marriages of certain British subjects all over the world. I concur in the regret which has been expressed that such is the law. I think that it ought not to have been passed, and I agree that it ought now to undergo some modification.—The Lord Chancellor: When I said that I had no doubt there had been a marriage in fact, I meant that there was evidence that the two parties had been married at Rome, by a clergyman of the Church of England, and, according to the evidence as it at present stands as referred to by the Noble and Learned Lord opposite, there was a valid marriage according to the laws of Rome. Whether such a marriage would be valid in this country for any other purposes is another question.—Lord Cottenham: My Lords, I beg to say that my opinion is formed entirely on the Royal Marriage Act. That is the only part of the case which has been argued before us. I do not say whether a marriage valid according to the law of Rome would be valid in this country or not. My opinion is, on the Royal Marriage Act, against the claim.—The committee then resolved that the claim was not made out.

The Irish Trials.—Writ of Error.—On Saturday Mr. Hill, Q.C., concluded his address on that part of the case relating to the defective jury lists, and the right of challenge.—Mr. F. Kelly, Q.C., then addressed the House on behalf of Mr. O'Connell, Mr. Ray, and Dr. Gray, and contended that the Jury had found three offences, where only one was charged, and that the Court had sentenced the defendants according to that finding. It was clear that the traversers had been found guilty of a greater number of offences than the Grand Jury had directed them to be put upon their trial for. Here a man was convicted of two conspiracies as to which he had never been put upon his trial—as to which he had never pleaded—as to which the Jury had no power to give an opinion. With respect to the findings, they could not return one and reject another. They must stand together, or they must fall together. Each, taken respectively, was good as a count—all, taken together, were good as counts—but on them the parties were brought in guilty of too much. The House adjourned at this point of the argument, and on Monday Mr. Kelly resumed his address, contending that, if one count in the indictment were bad, the judgment must be reversed; and that the proposition to be contended for on the part of the Crown—viz., that if one count were good, the judgment must be affirmed—was unreasonable, unjust, unsound in law and principle, and unsupported by authority. He then adverted to the other points at issue, and concluded by expressing his full confidence that their Lordships would reverse the judgment of the inferior Court.—The Attorney-General (Sir W. Follett), then replied on behalf of the Crown. He said that the principal objection which had been taken on behalf of the defendants was one the rejection of which he conceived to be of great importance to the due and proper administration of criminal justice. It was utterly impossible that they could succeed in the argument which they had addressed to their Lordships, without calling on the House to overturn the recognised and established law of the land as it was laid down in the books; and he confidently appealed to any one of their Lordships, he appealed to the judges then present, he appealed to any lawyer in England, whether they had ever before heard such a doctrine mooted as that which the defendants by their counsel had endeavoured to press upon the approval of their Lordships. He appealed to the practice of every court in the country, and he stated, without fear of contradiction, that in no case had judgment been entered up in the mode which his learned friends had stated as the right one. No such thing, he believed, had ever been done; and he maintained that it was completely impossible to overturn the law in a manner by which hundreds and thousands of criminals now suffering punishment would be virtually declared to have suffered punishment unjustly. He then cited authorities in support of his case, and adduced arguments in support of his position that the findings were good, and that even if they did exceed the issue, which he denied, it would not furnish grounds for setting aside the judgment. On Tuesday, the Attorney-General concluded his address, and was followed by Mr. Smith, Attorney-General for Ireland, who spoke for about half an hour.—Sir Thomas Wilde then replied on behalf of the appellants, and dwelt with much force on the affair of the Jury list. The challenge asserted that some unknown person, and not the authorised officer had delivered the list; but the Jury was made up from the list given in by that unknown person, so that the fraudulent list was that upon which the basis, the challenge of array was made. The Learned Counsel went on to argue that the fraudulent list was in some way connected with the political animosity borne towards the prisoners.—Lord Campbell: Let us, for God's sake, confine ourselves to the record.—Sir T. Wilde went on to say that it was most important that all suspicion of unfair practice should be banished from a political prosecution like the present. In that case the sheriff appeared altogether without blame, but in point of law he must be considered in default. The only remedy was, that a new Jury-book should have been made out. There was not a doubt that the challenge, in point of law, ought to be overruled, and therefore that the judgment could not be sustained upon it.—Mr. Hill, Q.C., intended to confine himself to the challenge of the array. Whether or not the Recorder sent the list to the clerk of the peace, it was clear that the Jury was struck from a fraudulent one.—Lord Chancellor: There is no dispute about the fact that the Jury was taken from a fraudulent list. It is clear that the Recorder sent a list to the Clerk of the Peace, but what became of that list does not appear.—Mr. Hill: Exactly so. All he knew was, that the proper list was not that from which the Jury was struck; whether the fraudulent list contained the same names mattered not.—Lord Chancellor: I apprehend that the only question is, whether the ground of the challenge of the array is a good one. —Mr. Hill addressed himself to this point, and at the close of his argument, Mr. Kelly addressed the House, contending that where one misdemeanour was charged in several counts, and one count was held to be bad, a Court of Error on appeal should reverse the judgment. After speaking upon this point for some time he said he had numerous authorities to quote, and the House adjourned.—At the sitting of their Lordships on Wednesday Mr. Fitzroy Kelly resumed his argument, and concluded by stating that his clients felt satisfied that their Lordships' decision would be founded on justice.—The Attorney-General said he believed the Crown had the right of a final reply, but he would not press it on this occasion. He wished, however, that it should not be drawn into a precedent.—The Lord Chancellor then said, that in conjunction with his Learned and Noble Friends, he had prepared certain questions for the opinion of the Judges, which his Lordship handed to the Lord Chief Justice Tindal, but did not state the purport.—Lord Chief Justice Tindal, on the part of the Judges, asked time to consider the questions. —The Lord Chancellor: Most certainly, you must be allowed all reasonable time to consider your decision.

POLICE—BOW-STREET.—On Saturday the Hon. *William Ross Tuchet*, brother of Lord Audley, was charged with shooting Mr. Thomas Smith, a respectable gunsmith, at 288, High Holborn, with intent to murder him. Mr. Alfred Smith stated that he was assistant to his father. About noon on Saturday, the prisoner came into the shooting-gallery at the back of the shop, and inquired whether he could have a few shots with a pistol at the target. Witness's father replied that he could, and immediately proceeded to load a brace of pistols. He gave them to the prisoner, who, after the second shot, observed that the triggers pulled very hard. Witness's father said he could set the hair triggers if the prisoner wished, on which the latter said he did not want them to go off so easily as that, and would shoot with them as they were. On receiving a pistol for the third shot, the prisoner, without saying a word, turned round, and while Mr. Smith was loading another pistol with his back towards him, he fired the pistol at him, and wounded him in the loins. Witness's father immediately exclaimed, "Good God! I am shot through the back," and then turning to the prisoner, asked him what he did it for, but the latter made no answer. The prisoner smiled at the time he fired the shot. Mr. Smith contrived, with witness's assistance, to walk up stairs. On witness descending to the shooting-gallery, he found Mr. Tuchet in the custody of a policeman, who told witness that the prisoner had said he was tired of his life, and had shot Mr. Smith on purpose, as he wished to be hanged. The prisoner also repeated the same words to witness, adding, that he bore no animosity to his father. He was then removed in custody to the station-house, and Mr. Smith was conveyed to Bartholomew's Hospital, where it was discovered that the bullet had lodged in the right side of his back. Witness saw the prisoner about three months ago at his father's shooting-gallery, when he had some shots at the target. On being examined by the magistrate, Mr. Tuchet said that he did it on purpose because he wished to be hanged; there was no other reason for the act, he had enough money, had not been ill, and was 22 years of age, but was very unhappy, and tired of his life. The magistrate remanded him for a week, and ordered inquiries to be made respecting him. In the course of the afternoon, Lord Audley, accompanied by the constable who apprehended the prisoner, arrived at the court, evidently much affected at the account he had received of his brother's conduct. He entered into a long conversation with Mr. Twyford on the bench, the particulars of which did not transpire. His lordship then proceeded to Clerkenwell Prison for the purpose of visiting his brother. Upon being introduced to him, Lord Audley inquired what brought him to that place, to which Mr. Tuchet, who appeared quite unmoved at his position, replied, "I am sure I do not know." It will be observed that this observation is altogether at variance with the answers made to the questions put by the magistrate during the examination at an earlier period of the afternoon. It is said that letters written by him evince decided proofs of aberration of mind; but the members of his family had hoped it was but a temporary affliction which had long since passed away. Mr. Smith, the object of Mr. Tuchet's attack, is going on well, and hopes are entertained of a favourable termination of his case. Lord Audley is incessant in his attentions to Mr. Smith. Besides the hospital surgeons, his lordship's own medical men daily attend him, and his servants inquire after him twice and three times a day.

SPORTING.

The Running Rein Case.—At a general meeting of the Jockey Club, held on Saturday the 6th, it was resolved—"That it being now proved that Running Rein was three years old when he ran for the Two-year-old Plate at Newmarket, Crenoline must be considered the winner of that race, and that the Duke of Rutland is entitled to that plate. That the thanks of the Jockey Club are eminently due, and are hereby offered, to Lord George Bentinck, for the energy, perseverance, and skill which he has displayed, in detecting, exposing, and defeating the atrocious frauds which have been brought to light during the recent trial respecting the Derby Stakes. That it is the opinion of this meeting that no publication of the proceedings of the Jockey Club should be made without the sanction of the stewards." It is announced that the noblemen and gentlemen of the Club, several proprietors of race-horses, and others interested in the turf, intend to present Lord G. Bentinck with a piece of plate, to mark their sense of the service he has rendered to the racing community, by detecting and defeating the attempt at fraud exposed in the late trial in the Court of Exchequer. The subscription is to be confined to 25*l.*, and from the number of names already down, it is expected to be a very large one.

NEWMARKET JULY MEETING.—This meeting has proved a very dull affair, and the sport has been of a corresponding character. —TUESDAY.—*The July Stakes*, of 50 sovs each, 30 ft: for two-year-old colts, 8st 7lb; and fillies, 8st 5lb. New T.Y.C. The second to save his stake. 15 subs. Mr. John Day's Old England beat Lord Albemarle's Scarmentado; Colonel Peel's b f by Slane, out of Seakale, and Lord Exeter's Deodara. Won by a neck. Duke of Bedford's Glen Fishie, 8st 12lb, received from Lord Exeter's Petrowna, 6st 12lb. New T.Y.C. 100, h ft.—WEDNESDAY.—A miserable day's sport was preceded by the sale of the late Mr. Thornhill's two-year-olds and yearlings. The racing attracted but a small attendance, and may be described in half-a-dozen lines:—*Town Plate* of 50*l.*, for two-year-olds: colts, 8st 7lb; fillies, 8st 3lb. Last mile and a distance of B.C. Duke of Bedford's Glen Fishie beat Lord W. Powlett's Falconer and Lord Exeter's Crosby. Won easy by a length.—50*l. for three-year-olds*, 7st 2lb; four, 8st 7lb; five, 9st 1lb; six and aged, 9st 5lb. From the starting post of T.M.M. to the end of R.C. Mr. Boyce's Coranna, 5 yrs, beat Lord Lonsdale's Blackdrop, 4 yrs, and Lord Exeter's Wee Pet, 4 yrs. Won by five lengths.—THURSDAY.—*Handicap Sweeps* of 15 sovs each, 10 ft, for all ages except two-years-old; to start at the starting post of B.M., and run to the end of New T.Y.C. 3 Subs. Lord Exeter's Algernon, 3 yrs, 8st 5lb, beat Mr. Sare's Sir Diggory Diggle, 3 yrs, 8st 7lb; and Duke of Bedford's g by Liverpool, 3 yrs. Won by a length.—*Chesterfield Stakes* of 30 sovs each; for two-years-old colts, 8st 7lb; and fillies, 8st 4lb. 17 Subs. Last half of B.M. Lord Chesterfield's f by Hornsea, out of Dirce, beat Lord Albemarle's b f Tisiphone; Lord Lonsdale's Sister to Canadian; Colonel Peel's b f by Slane; Lord Exeter's ch f Deodara; Mr. King's b c Richard Crickett; and Mr. Wagstaff's Queen of Cyprus. Won by a head.—The Hon. Colonel Anson was appointed Steward on Wednesday, the Hon. G. Byng's three years having expired this meeting.

BIRTHS.—On the 7th inst., at Hatfield, Broadoak, Essex, the lady of the Rev. T. F. HALL, of a son—7th inst., at Gloucester-gate, Regent's Park, Mrs. W. DODSWORTH, of a son—7th inst., the lady of S. BRENT, Esq., of a daughter—7th inst., in Burton-street, the lady of T. H. GOLDEN, Esq., of a son—7th inst., Mrs. G. ASHLEY, of Brixton-hill, of a daughter, which survived only till 10th inst.—7th inst., at Newton St. Loe, near Bath, the lady of C. GUNNING, Esq., of a son—8th inst., at 146, Piccadilly, Mrs. G. F. LEWIS, of a son—8th inst., at Mount Pleasant, the lady of A. PLUNKETT, Esq., of a son—8th inst., at Houghton Hall, near Carlisle, the lady of J. R. GRANT, Esq., of a daughter—9th inst., at Chislehurst, Kent, Mrs. J. R. CUTHBERT, of a son—9th inst., in Devonport-street, the lady of J. WILLIAMS, Esq., barrister, of a daughter—10th inst., at Vauxhall, the lady of J. R. F. BURNETT, Esq., of a son.

MARRIAGES.—On the 27th ult., at Tiberton, Herefordshire, W. V. GUISE, Esq., eldest son of Lt.-Gen. Sir J. Guise, Bart., K.C.B., of Rendcomb-park and Elmore-lodge, county Gloucester, to MARGARET A. M. WARNER, eldest daughter of the Rev. D. H. Lee Warner, of Tiberton-court, Herefordshire, and Walsingham Abbey, Norfolk—3d inst., at Blackawton, Devon, V. HINE, Esq., of Dartmouth, (only son of the late Capt. John Hine, of the Hon. East India Company's Service), to ANNA TEMPLER, second daughter of the late G. Templer, Esq., of Sandford Orleigh—3d inst., at Walcot Church, Bath, S. SNEADE BROWN, Esq., of the Bengal Civil Service, to AMELIA WATSON, eldest daughter of Dr. James Watson, of the Circus—9th inst., at St. James's, Westminster, the Rev. E. H. GROVE, Vice-Principal of Brasenose College, to the Hon. HARRIET LISTER, one of Her Majesty's Maids of Honour.

DEATHS.—On the 23d ult., at Edinburgh, ANNE MURE, daughter of W. Mure, Esq., of Caldwell, one of the Barons of the Exchequer, aged 19—Recently, at her seat, Woodtown House, Dublin, H. JOY, sister of the late Lord Chief Baron Joy — 1st inst., at her residence, Cheltenham, the Hon. CAROLINE FLOWER, daughter to the late and sister to the present Visc. Ashbrook—3d inst., at Stockton-upon-Tees, R. PULMAN, Esq., of that place, solicitor—4th inst., very suddenly, at his residence, Clive, Somersetshire, T. HOOLE, Esq., late of the East India House—4th inst., ELIZ. ATTWOOD, wife of the Rev. William Hamilton Attwood, of Beddingfield, Suffolk, and youngest daughter of the late John Hodgkinson, Esq., of Stamford-street—5th inst., MARY F. PHILLIPS, eldest daughter of R. Phillips, Esq., of Angel-terrace, Pentonville, aged 5 years —5th inst., Capt. W. W. FOOTE, R.N., of the Royal Hospital, Greenwich, aged 77, 65 of which were spent in the service of his country—5th inst., at Denmark-hill, Surrey, C. WRENCH, Esq., aged 74—5th inst., at Kendal, Westmoreland, MARY BARROW, relict of the late J. Barrow, Esq., aged 72.

GLASS CHANDELIERS FOR DRAWING-ROOMS.—APSLEY PELLATT (late Pellatt and Green) Falcon Glass Works, Holland-street, Blackfriars, has recently constructed a NEW CHANDELIER (Registered), which surpasses in brilliant and refractive effects all former efforts, to which he invites inspection. Renaissance and other Glass Chandeliers as usual at low prices, which, when lighted, have a far more resplendent effect than buhl. TABLE CUT AND ENGRAVED GLASS at the Printed List of Prices, subject to an extra discount for Cash. The manufactory and steam-cutting works may be seen any Tuesday, Wednesday, or Thursday. Merchants' orders and outfits for Glass and China on the very lowest terms. No connexion with any house in the City.

PRESERVES and CONFECTIONERY.—The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home-made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18*s.* per Gallon, exclusive of the price of the Jar; and in Glass Bottles, at 20*s.* per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, JUN., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

WANT PLACES.—All Letters to be post-paid.

JAMES ROBERTS (Author of "A Comprehensive View, or a New Era in the Culture of the Vine under Glass"), being yet disengaged permanently, begs to say—from the many letters he has received from Gentlemen Amateurs on the Culture of the Vine, as to their failure and only partial fruitfulness, which tends to create great disappointment in the culture of this delicious fruit—that at present he is at liberty to wait upon any one professionally at a reasonable charge, when, from inspection and improved points of culture, they will be enabled to produce regular uniform crops of this long-neglected but most generous of all Exotic Fruits, the result of the general failure of which is a total misapplication of its unlimited powers. —All Letters addressed Hampsthwaite, near Harrogate, Yorkshire, shall be duly attended to.—July 1, 1844.

AS GARDENER.—A young Man, aged 28, who has a thorough practical knowledge of his business in all its branches, and whose character will bear the strictest scrutiny. Direct to William Thomson, Gardener to George Byng, Esq., M.P., Wrotham Park, Barnet, whom the Advertiser has served as Foreman for six years.

AS GARDENER.—THOMAS SMY, late Gardener to Col. ROLLESTON, M.P., Watnal Hall, Notts, is desirous of engaging with any Nobleman or Gentleman wanting a Gardener well acquainted with the various branches of his Profession, having previously lived 7 years in one of the first establishments in England as Foreman in the several departments. Can be confidently recommended. Terms moderate. Reference to Mr. Tillery, Gardener, Welbeck, near Worksop, Notts, and Mr. Mearns, Curator, Botanic Gardens, Leeds.—Direct to T. SMY, Botanic Gardens, Leeds, Yorkshire.

AS GARDENER.—A married Man, aged 31, who understands Kitchen and Flower-Gardening, also Forcing Cucumbers, Grapes, and other Fruits. Would have no objection to a Cow, or to take charge of Land. Can have two years' character.—Direct to A. B., Mr. Denyer, Nursery, Brixton.

AS GARDENER.—A single Man, who has had good practice in all the branches of Horticulture, and has lived 19 years in the situation he has just left, where he will refer for every information required.—Direct to J. W., Foster's Nursery, Stroud, Gloucestershire.

AS GARDENER.—A single Man, aged 30, who thoroughly understands his business in all its branches. Can be highly recommended by his present employer.—Direct to J. GOODHEW, J. B. Hankey, Esq., Fetcham Park, Leatherhead.

AS GARDENER, or as FOREMAN.—A steady, active young Man, who understands Gardening in general. The Advertiser has served under several good Gardeners, and has lived nearly two years in his present situation as Foreman, and will be at liberty on the 20th inst.—Direct G. W., Post-office, Harlow, Essex.

AS GARDENER.—A young Man, who understands his business in its various branches; also the management of Stock. Has had upwards of 13 years' practice in Gardening. No objection to live in the lodge if required. The most satisfactory references can be given.—Direct to J. C. at Fairbairn's Nursery, Clapham.

AS BAILIFF.—A single Man, aged 35, who has a practical knowledge of the East Lothian system of Farming, having been brought up to it from his youth; the Rearing and Feeding of Stock; and is quite conversant with the new system of Draining and Laying out Pasture-Lands—is desirous to engage with any Nobleman or Gentleman in the above capacity. Can produce the most unexceptionable references as to character and abilities.—Direct to R. M., Bartlet-field, near Bridge of Earne, Perthshire.

ROYAL SURREY ZOOLOGICAL GARDENS.
TUESDAY, JULY 23, 1844,

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY will hold their SECOND GRAND MISCELLANEOUS FLOWER SHOW, of Flowers, Fruits, and Vegetables, on which occasion Prizes of Gold and Silver Medals, Vases, &c., will be given for the best Specimens of Picotees, Carnations, Heartsease, Fuchsias, Cut-Flowers, Ericas, Cockscombs, Balsams, Pelargoniums, Carnations, Orchidaceæ, Fruit, Vegetables, and Miscellaneous Plants. And in addition, the beautiful and interesting MODEL OF VENICE. And at Dusk will be exhibited THE GREAT FIRE OF LONDON. Admittance, One Shilling.

THE ANNUAL MEETING of the MIDHURST HORTICULTURAL and FLORICULTURAL SOCIETY, will be held on Tuesday the 17th September, when Prizes will be given for Flowers, Fruits and Vegetables, Particulars of which may be had on or after the 10th August next, on Application being made to Mr. John Thorp, Jun., the Secretary.

YOUELL & CO.'S SPLENDID COLLECTION of FUCHSIAS is now in full bloom, and comprises all the new varieties of the present season. Admission gratis.
Great Yarmouth Nursery, July 18, 1844.

ARAUCARIA IMBRICATA.

SPLENDID NEW PINUS.—Fine healthy Plants about 9 inches high, can be had at Hurst and M'Mullen's Seed-shop, No. 6, Leadenhall-street, London, at 5*l.* per 100.—July 18, 1844.

PRINCESS ALICE MAUDE STRAWBERRY.—This very excellent kind, which has taken first Prizes at most of the Horticultural Shows this season, can be had at Hurst and M'Mullen's Seedshop, No. 6, Leadenhall-street, London, at 25*s.* per 100. It is the earliest known, and very fine flavoured. Also Myatt's British Queen ditto, at 6*s.* per 100. July 19th, 1844.

JESSOP'S NURSERY, Cheltenham, Established in 1815, from its extensive connection, offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm-bailiffs, of established skill and reputation. All communications promptly attended to.

RARE AND BEAUTIFUL COLUMBINE.—The Subscribers beg to intimate that they have saved Seeds of a superb variety of Aquilegia glandulosa. This splendid Columbine is a hardy Perennial, and forms one of the most gay border-plants in cultivation; it grows to the height of from 12 to 18 inches, abounding in two coloured blossoms—blue and white—of the size and shape of the common Passion-flower. Packages of about 150 Seeds are sent free at One Shilling per packet, or for stamps of that value.
John Gibson, and Co., Nurseries, Forres, N.B.

NEW THUNBERGIAS, &c.

JOSEPH FRYER begs respectfully to refer to his Advertisement in last week's *Chronicle*, for particulars of his two very desirable new varieties of Thunbergias—Alata superba, and Aurantiaca superba—which are pronounced by all who have seen them to be superior to anything of the sort ever produced. All orders will be executed in the rotation they are received, as far as the stock will allow.
J. F. likewise begs to offer, as below specified, small plants of which will be sent by post free, or larger carefully packed in hampers.

Fuchsias, all the new varieties sent out this year, each 1*s.* 6*d.* to	3 6
" The most esteemed varieties sent out last year (large plants), each	1 0
" A collection of older varieties (large plants) doz.	6 0
Petunias, the finest varieties sent out this year, doz.	10 0
or each	1 0
Verbenas, a collection of the finest varieties, doz. 4*s.* to	6 0
or each	1 0
Cryosanthemums, a collection of finest varieties, doz.	9 0
Pansies, a collection of finest varieties, doz. 6*s.* to	18 0

Leonotis leonurus, 6*s.* doz.; Lobelia splendens and fulgens, 6*s.* to 9*s.* doz.; Gaillardia picta, 6*s.* doz.; Achimenes longiflora, 6*s.* doz.; Thunbergia alata and aurantiaca, 9*s.* doz.; do. Erveria, 1*s.* 6*d.* to 2*s.* 6*d.* each; and every other desirable variety of plants for bedding out, &c., at moderate prices.
N.B.—A remittance is expected from unknown correspondents.—Clarendon Nursery, Camberwell, London, July 19, 1844.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL AND CO. are now sending to any part of the United Kingdom, the undermentioned highly-desirable Plants, full particulars of which will be found in their former Advertisements.

FUCHSIAS—per post free.
12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.

Britannia	Majestica (Smith's)
Prince of Wales (Bell's)	Rogersiana
Exoniensis	Gem iveris
Robusta	Eppsii
Fairy Queen (Bell's)	Brockmanni
Iveryana	Transparens
Hero	Magnificent (Bell's)
Laneii	Magician

Price 12*s.* per dozen, varieties selected by the purchaser; or 9*s.* per dozen, selected by G. N.
No charge for hamper. A remittance expected from unknown correspondents.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex.
VERBENA HUDSONII.

WM. WOOD AND SON, having purchased the entire stock of the above magnificent VERBENA, beg leave to solicit attention to Dr. Lindley's opinion of it in the *Gardeners' Chronicle*, July 6th, p. 448.

"*W. W.*—Hudsonii is a good variety, bright rosy purple, with a white eye, distinct in colour." To which description W. W. & S. may be allowed to add, that the flowers are large and very showy; it has been seen by several competent judges, who have pronounced it to be a variety of first-rate merit. Plants will be ready for sending out on the 20th August next, packed in tin cases and forwarded post-free, at 3*s.* 6*d.* each, with the usual allowance to the Trade when six plants or more are taken at once.
A remittance will be expected from unknown correspondents.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD SUSSEX.
SUPERB NEW FUCHSIAS, PETUNIAS, VERBENAS, &c.

WILLIAM WOOD AND SON have much pleasure in offering the following selection of the above, in fine condition for autumnal flowering, strong plants of which are now ready for sending out.

FUCHSIAS.

	each.—*s.*	*d.*		each.—*s.*	*d.*
Attractor (Standish)	7	6	King John (Hally)	3	0
Boydii (Hally)	3	6	Lindleyana (Youell)	5	0
Colossus (Standish)	7	6	London Rival (G. Smith)	5	0
Conductor (do.)	5	0	Marginata (Hally)	2	6
Coronet (Smith's)	5	0	Neptune (Smith)	5	0

Also the following fine varieties, at 9*s.* per dozen, the selection being left to the purchaser, or one plant of each for 12*s.*:—Amethystina, Barnsii, Beauty, Bishopii, Boule de feu, Bridesmaid, Burleyana, Fortune-teller, Harlequin, Howardiana, Joan of Arc, Laconii, Minstrel Boy, Renown, Rival King, Speciosa, Taglioni, White Perfection.
W. W. & Son have also on hand an extensive collection of Camellias, Miscellaneous Plants, &c., priced Catalogues of which may be had on application.
*** Agents by appointment for the sale of WHITNEY'S TRANSPARENT COMPOSITION, for covering Greenhouses, Frames, &c. Sold in bottles—pints 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each, with printed directions for use.

NEW PANSY-SEED

WILLIAM CLARK, 25, Bishopsgate-street Within, London, is now sending out SEED just gathered, warranted from the best flowers, and can confidently recommend the same, knowing the kinds collected from. In papers of 2*s.* 6*d.* and 5*s.* each. Also J. H. Cox, Esq.'s superb PICOTEE-SEED, 5*s.* per paper, may be had, on receipt of a Post-office order.

CLOTH OF GOLD NOISETTE ROSE.

H. CURTIS begs to inform the Nobility and Gentry he has a few Plants remaining of the above highly-desirable double yellow Autumnal Blooming Rose, which would yield several good buds for inserting this summer. Plants, 10*s.* 6*d.*, package and carriage to London included.—West of England Rose Nursery, Moorend, near Bristol.

SHILLING'S QUEEN CABBAGE.—This month and part of August being the time to sow Cabbage Seed for the Autumn and Spring Planting, J. & S. SHILLING having a little Seed left of the above very superior kind, which they highly recommend to those who have not already tried it—beg to offer it to the Public generally, in half oz. packets, postage free, at 2*s.* 6*d.* each, on the receipt of postage stamps or a Post-office order.—Northwarnbro' Nurseries, Odiham, Hants.

BENTALLS' IMPROVED PAPER FOR DRYING PLANTS.

W. AND T. BENTALL, in soliciting the attention of Botanists to the above Paper, beg to submit to their notice the following, as one of the numerous Testimonials with which they have been favoured:—

"Gentlemen,—Though my trial of your new Botanical Paper has been short, I think it may safely be pronounced the best combination of the qualities required in such paper that I have hitherto met with, after trying several kinds, both British made and Foreign.

"It seems probable that your Paper will prove more serviceable to the Botanical traveller than the thick grey Paper often sent with specimens from Germany, and much esteemed by English Botanists; but having the serious defect of extreme liability to tear, which does not appear in your Paper. It certainly ought to supersede the demy Grey recommended in the Instructions issued by the Botanical Society of Edinburgh."—*H. C. Watson, Esq., F.L.S., Vice-President of the Botanical Society of London.*

Professor Lindley, University College, London, & C. C. B. Babington, Esq., F.L.S., St. John's College, Cambridge, have also kindly allowed the use of their names as strongly recommending it.
May be had of the Manufacturers, Halstead, Essex; and of their agents, Mr. E. Newman, 9, Devonshire-street, Bishopsgate-street, London; and Mr. R. S. McIntosh, 12, Catharine-street, Edinburgh.
For Sizes & Prices, see *Gardeners' Chronicle*, June 8th & 15th.

LYNDON'S PATENT SPADE.—Sold by Green and Constable, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

CURTIS'S BUDDING KNIFE.—"This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved penknife, sharp, and turned up at the point, and is evidently extremely well contrived for the purpose it is intended."—Opinion of Professor LINDLEY, in the *Gardeners' Chronicle*, July 29, 1843.

GEORGE PLUM, Surgical Instrument Maker and Cutler, No. 262, Strand, London, and at No. 3, Dolphin street, Bristol, begs to call the attention of the public to the above new and desirable article, manufactured solely by him. Sent free to any part of the kingdom, on receipt of 38 postage stamps, or a post-office order for 3*s*. 2*d*.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith.*

"I write to describe the wonde ful efficacy of POTTER'S LIQUID GUANO; Peas, Onions, and Asparagus have been singularly improved by it. People came to admire the appearance of the garden."—See *Chronicle*, p. 406.

*** Beware of an inefficacious imitation. See *Chronicle*, p. 405—"Humphreys's Compound."

Sold by most Chemists and Seedsmen.

Factory, 28, Upper Fore-street, Lambeth.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in lenth.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

HORTICULTURAL SOCIETY of LONDON.—EXHIBITION AT THE GARDEN, July 13th, 1844.

INSTRUCTIONS TO THE JUDGES AS TO THEIR CONSIDERATION OF THE NOVELTY OF THE OBJECTS EXHIBITED.

IN forming your opinion of the subjects submitted to you for examination, you are requested to take into consideration whether they have been exhibited previously or not. The OBJECT of this regulation is to give specimens produced at the Society's Garden Meetings, for the first time, an advantage over others previously exhibited, although of equal merit; and to obstruct the system of exhibiting very fine plants repeatedly, to the disadvantage of others. The EFFECT of this regulation should be,—1. That if two collections should be nearly the same in point of merit otherwise, that in which no previously exhibited specimen shall be found, will be regarded as the better of the two. 2. That in all cases of doubt, the person who had not exhibited previously shall have the benefit of the doubt. 3. That when each of two competitors shall have introduced previously exhibited plants into his collection, that collection which contains the fewest of them shall be deemed the superior if they are otherwise nearly alike. It is not, however, wished that the previous exhibition of plants should depreciate their value so much as to place a superior collection below one very decidedly inferior. The APPLICATION of this regulation is left to your judicious consideration.

AWARD OF THE JUDGES.

LARGE GOLD MEDAL.

1 To Mr. Mylam, Gardener to Sigismund Rucker, Esq., jun., F.H.S., for a collection of Exotic Orchidaceæ

GOLD KNIGHTIAN MEDAL.

1 To Mr. Robertson, Gardener to Mrs. Lawrence, F.H.S., for a collection of 30 Stove and Greenhouse Plants
2 To Messrs. Rollisson, of Tooting, for a collection of Exotic Orchidaceæ

8 To Mr. Cuthill, F.H.S., for Lisianthus Russellianus
9 To Mr. Dawson, of Brixton, for Erica ampullacea major
10 To Mr. Hopgood, of Bayswater, for Sollya linearis
11 To Mr. Robertson, for Achimenes longiflora
12 To Messrs. Henderson, for Erica tetragona
13 To Mr. Robertson, for Erica eximia
14 To the same, for Erica tricolor elegans
15 To Mr. Gad, Gardener to T. Lenox, Esq., F.H.S., for Brugmansia floribunda
16 To Mr. T. Jackson, F.H.S., for the third best-named collection, (*one error in 20 plants*)
17 To Messrs. Fairbairn, for the fourth best-named collection, (*one error in 20 plants*)
18 To Mr Mylam, for the fifth best-named collection, (*two errors in 33 plants*)
19 To the Hon. and Rev. Robert Wilson, F.H.S., for Raspberries
20 To Messrs. Youell and Co., of Great Yarmouth, for Fastolf Raspberries

*** In consequence of CC. 2, CC. 9, CC. 4, CC. 10, having been exhibited as *new or rare* plants, instead of miscellaneous plants so far as the three first are concerned, and as a single specimen of Orchidaceæ in the case of CC. 10, the Judges have been obliged to pass them by, instead of assigning them the Medals which they would otherwise have received. They must also add that Brugmansia floribunda *scarcely* comes within the meaning of new or rare plants.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, July 20, 1844.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

THE COUNCIL
OF THE
Horticultural Society of London

Having ascertained that a very large number of the Exhibition Tickets of the present season have not been used, chiefly on account of the unfavourable weather of the 13th—the last day fixed for the Exhibitions; and

HIS GRACE THE DUKE OF DEVONSHIRE, the President of the Society, having most kindly offered again to throw open the grounds of Chiswick House,

NOTICE IS HEREBY GIVEN.

That there will be on WEDNESDAY, the 31st of July, a MUSICAL PROMENADE in the Society's Garden, at which the unused Tickets of the present season will be received. Other Tickets for the occasion will be issued till the 30th inst. at this Office, price 3*s.* 6*d.* each, or at the Garden on the 31st inst., at 5*s.* each; under the regulations already in force for governing admission to the Exhibitions at the Garden. The usual refreshments will be supplied by Messrs. Gunter.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, JULY 20, 1844.

MEETING FOR THE TWO FOLLOWING WEEKS.
TUESDAY, July 23 South London Floricultural . 1 P.M.

AT last, after 36 fine or nearly fine days spread over 12 years, the HORTICULTURAL SOCIETY have experienced a wet meeting, which was the more unfortunate, because his Grace the Duke of Devonshire, the noble President of the Society, had opened his beautiful park and gardens to the enjoyment of the visitors, and an unusual abundance of the most accomplished military musicians had been provided, to enliven the scene among the promenaders.* Nevertheless, 4278 persons thronged into the tents and grounds, as regardless of the pitiless rain as they were in May of the bitter wind.

The Exhibition was by far the best we ever saw in the Garden in July, and we incline to think it in some respects the finest of the present season. Of the Orchidaceæ, the single specimens, such excellent tests of cultivation, and, indeed, of the majority of the plants, it is impossible to speak in terms of too much praise. The fruit, however, was the great thing. Conceive 96 Pine-apples, 300 or 400 lbs. of Grapes, and endless dishes of all sorts of other kinds, capitally grown, packed in close order upon a very large circular table, tier above tier, and some notion may be formed of this extraordinary spectacle. We find that as many as 44 Medals were distributed among the competitors.

Although it is impossible on occasions of this kind for everybody to win Medals, yet we do think it due to the exhibitors to say, that we remember the time when the worst of those who showed last Saturday would have stood a fair chance for first-class Medals; so much has gardening advanced of late.

The system of offering rewards for correct labelling has of course produced its effect. It has not only caused the plants to be in almost all cases correctly and legibly named—a great convenience to the spectator—but it has turned the attention of the exhibitors to the importance of spelling the names of their plants with exactness. In the great collection exhibited last Saturday by Mr. Robertson, gr. to Mrs. Lawrence, there was not a single error which the critic could detect, and the writing of the labels was a beautiful specimen of penmanship. Some people may think this a point of no importance, and that it matters not at all whether a man writes and spells well or not, so that he is intelligible. Such persons will also think that it is all the same whether they grow their plants well or ill, so that they do it well enough to keep their places.

It is hopeless to expect that great meetings of this sort should always pass off without errors on the part of the various persons engaged in doing in six hours what ought to consume twenty-four—and in these we include exhibitors, judges, and the officials of the Garden. But if there is one source of error less excusable than another, it is that of mis-entries by the exhibitors. The Society gives the fullest explanation of the classes in which plants are shown; printed papers, explaining in ample detail all that it is necessary to know, are distributed by thousands, to say nothing of advertisements; and yet persons will bring their plants to the Exhibition without having once examined the regulations, and place them in classes to which they in no manner belong; the consequence of which is their being disqualified. It may be said that this signifies to nobody except the exhibitors, who are sufficiently punished for their negligence by the loss of their medals; but we cannot look at the matter exactly in that way. We never see without regret fine specimens, which must have cost the grower much care and solicitude, and which he has perhaps been nursing for weeks, in the laudable hope that they might at last gain for him some honourable distinction, passed by, merely because they are put into wrong classes. It is distressing that the error of a moment should thus nullify the labour of weeks. Yet this constantly occurs, and the Society can neither prevent nor remedy it. For example:—Last Saturday there were the following specimens, all of them well grown, and creditable to anybody, which experienced this disaster. One of the best plants we ever saw of Gloriosa superba, from Mr. Gad, gardener to Thomas Lenox, Esq., a capital Erica tricolor from Messrs. Henderson, Pine Apple Place, and a very nice Statice sinuata, from Mr. Thomas Jackson of Kingston, were all passed over because they were shown as single specimens of new or very rare ornamental plants, which was absurd. And in like manner, a fine Stanhopea oculata, the original variety, and one of the best, a plant introduced to our gardens above fifteen years ago, was also exhibited as a new plant, although there is a class expressly for single specimens of Orchidaceous plants. We do trust that in another year exhibitors will avoid these most unnecessary mistakes.

Now that the last of these great Horticultural meetings is over, we would beg all those who are interested in the success either of them or of gardening, now, when all the circumstances relating to them are fresh in their memory, to state by letter, addressed *To the Vice-Secretary*, 21, *Regent-street*, whatever they can suggest by way of improving the regulations. We can assure them that the Committee, to whom those letters will be submitted, will give them the fullest attention, and will adopt the recommendations wherever they feel that they would be justified in doing so. It is probable that the Committee will meet during this month, in order to settle the arrangements for next year.

WE stop the press to announce that the noble PRESIDENT of the HORTICULTURAL SOCIETY has, in the kindest manner, offered again to throw open the grounds of Chiswick House to the visitors to the Garden of the Horticultural Society, and that the Council have therefore just decided upon providing a large attendance of Military Bands at a Musical Promenade in the Garden on the 31st inst., to which all the holders of the unused Exhibition tickets of Saturday last will be admitted. For further information we must refer to the advertisement in another place, and to our columns of Saturday next.

SOME weeks since a correspondent from Brixton asserted that the fertilising substance extensively sold in the shops under the name of "HUMPHREYS'S SOLUBLE COMPOUND," and stated to form a *liquid Guano* of superior quality when dissolved in water, was "little else than nitrate of soda and common salt," and that a chemist had been unable to find in it a trace of phosphate of lime (p. 405). The following week Mr. Humphreys replied that his Compound contained neither nitrate of soda nor common salt; and *that the phosphoric acid in his article is introduced under a form of far more general application than phosphate of lime* (p. 430). This seems to have excited the attention of Mr. Potter, who (p. 445) after a chemical examination of the material, pronounced the "Compound" to be utterly devoid of phosphoric acid in any shape.

Here we should have been contented to let the matter rest; for Mr. Potter was not likely to peril his reputation as a chemist by an assertion which could be so easily disproved, if untrue. However, Mr. Humphreys perseveres in his original declaration, as will be seen by the following not very courteous letter:

"Lest the public should be misled by the insinuations contained in Mr. Potter's Letter of last week, I beg leave to show the simple facts of the case. In my communication at page 430, it was stated that the compound *contains phosphoric acid in a form of* MORE EXTENSIVE USEFULNESS *than that of the phosphate of lime*—and that, as the latter salt is insoluble in water, it was absurd to expect to find it in the Compound." On this Mr. Potter remarks:—"Who ever heard of guano without it?" Now, if Mr. P. will refer to the masterly analysis of guano, by Vellacher, given in the "Pharmaceutical Journal," p. 501, he will find that "guano contains *no soluble* salts of lime;" so that the point is, as it were, twice proved: an actual solution of guano itself does not contain lime! Mr. Potter next relates some inefficient chemical experiments, on which he assumes, notwithstanding my previous contrary assertion, that the Compound is "utterly devoid of phosphoric acid in any shape." I shall not notice the personality which follows, further than to hint to Mr. Potter, that the Compound was not put together with the view that it could be analysed by such chemists as himself, and that *the phosphoric acid is used* UNDER A CHEMICAL ARRANGEMENT, *which renders it invisible* under the action of the test he names, or even of that very superior one in general use, the nitrate of silver. I am sorry Mr. Potter does not fancy my advertisement, which is evidently distasteful to him, exactly in proportion as it will be useful to the public. But one word more:—Mr. Potter speaks of my public statement, that the Compound contains phosphoric acid, as "an unsubstantiated assertion;" I would, therefore, refer him, or any other person, for a corroboration, to Messrs. DAVY MACMURDO, and Co., who have manufactured the preparation of phosphoric acid in question, for the Compound.—J. D. HUMPHREYS."

Here, then, is a violent clash of assertions; and it is impossible for the public, which is much interested in the question, to determine what is the truth. Whether Mr. Humphreys's Compound contains phosphoric acid, according to the assertion of its vendor, or does not, as Mr. Potter has affirmed, is a very material fact for the buyer, and one which, since this Journal has been made the scene of contention, we feel bound to answer. We have therefore caused the "Soluble Compound" to be analysed by one of the most skilful chemists of the present day, and the following is his Report:—

"I have examined two samples of 'Humphreys's Soluble Compound.' I find it to be nitrate of ammonia. It contains rather less than 1 per cent. of other matters; namely, iron, from which it derives its colour; lime, alkaline salts, chlorine, sulphuric acid, and phosphoric acid. The quantity of each of these substances is very minute; I have not estimated it. The oxide of iron amounts to 0.32 per cent. *I regard them of no value as part of the manure.*"

We shall make little comment on this fact. Analysis proves that Humphreys's "Soluble Compound" contains so little phosphoric acid that it is doubtful whether it exists in it at all. Of 100 lbs. of the Compound 99 lbs. are nitrate of ammonia, and the remaining pound consists of about five ounces of oxide of iron, and *eleven ounces of lime, alkaline salts, chlorine, and sulphuric and phosphoric acids!* So that what Mr. Humphreys calls "a form of phosphoric acid of far more general application and more extensive usefulness than phosphate of lime," is in fact its almost total absence. By this kind of reasoning its total absence would have made it more useful still. Nobody will now dispute his statement, that it is used under a chemical arrangement which renders it invisible under ordinary tests. Those must be delicate tests which can discover a drop in a hogshead.*

ENTOMOLOGY.

THE WOOLLY OAK-GALL, produced by *Cynips Quercus-ramuli*.—As the galls formed by insects are very remarkable and interesting objects, and the habits of the various species creating them but little known in this country, even by men of science, I shall avail myself of every opportunity to render their histories more familiar to our readers. Having already investigated the economy of several species,† I must refer to my former papers for a general account of the family.

The woolly Oak-galls do not appear to be so common as many other sorts, at least I have never seen them growing; it was, therefore, with much pleasure that I received examples last May, from Mr. Coller, of Normanton Turville; the tree at that period, I learned, was literally covered with these Oak-apples, but none of the common varieties could be found upon it. On opening one of the galls at that time, I found at the base, and amongst the stamina of the male flowers, little brown, woody, oval cells, each containing a minute, white, shining maggot. Towards the end of June I received a fresh supply of these galls; they were not so white as the former, and Mr. Coller informed me that many of them had turned brown and fallen off. In May they looked like balls of white raw cotton, but on closer inspection they exactly resembled short wool, and still more so in June, when they were yellowish, with a pale brownish tinge in parts.

It is certainly wonderful that the puncture of these little flies should produce such a revolution in the regular course of nature, as to change flowering buds into large masses of fine threads; and equally marvellous is it, considering the similar conformation of all the Gall-flies that attack the Oak, of which 14 have been described, that the galls of the different species should assume such a variety of appearances; many are round and placed singly, others in groups; some are irregular in outline, spongy, woolly, or mossy; others there are, hard and solid; then, again, the spot selected by each species is unvarying—the upper or under side of the leaves, the footstalks, the catkins, and even the roots, buds, and bark, having each its appropriate Gall-fly.

On examining the woolly galls, I ascertained that they were formed upon the male catkins, which was well ex-

* The following arrangements were ordered to be observed by the military bands on this occasion:—"The bands of the Royal Horse Guards, Coldstreams, Fusiliers, and Royal Artillery, will take their stations in the Society's Garden by one o'clock, and will commence playing as usual. At 25 minutes to 2, P.M.; the Coldstreams, the Royal Horse Guards, and the Fusiliers will march to the station of the Royal Artillery, playing the *British Grenadiers' March* in E flat. The four bands will then form themselves into one; and at a quarter to 2 P.M., will play the *Overture to Zampa*, which will be conducted by Mr. Tutton, Bandmaster of the Royal Horse Guards. At the conclusion of this piece, the Fusiliers, Coldstreams, and Royal Horse Guards will resume their stations, and the band of the Royal Artillery will file off in two divisions into the grounds of His Grace the Duke of Devonshire, the whole playing the *British Grenadiers' March* as before. During the afternoon, all the bands will play separately, as usual. At half-past 5 P.M., the band of the Royal Artillery will march back from Chiswick House in two divisions, again playing the *British Grenadiers' March*. One division will be joined on their march by the Blues and Fusiliers, the other division by the Coldstreams, and the whole will resume their first position, again forming themselves into one band. The four bands, thus united, will then play the *March in Oberon* and the *Jubilee Overture*, both of which will be conducted by Mr. Godfrey, Bandmaster of the Coldstreams. At the conclusion of these pieces, the bands will quit the Garden."

[In consequence of the badness of the weather, these arrangements could not be carried into execution. However, at half-past five, the bands collected, and played most admirably the Overture to Zampa, the March in Oberon, and God Save the Queen. The effect thus produced among the trees by wind instruments, played on by 150 of the best performers in Europe, was perfectly enchanting; and we trust the experiment of bringing together large numbers of military instruments will be tried again another year, when we may hope for more favourable weather.]

* Since this was written, we have received a note from Mr. H., in which he states that the phosphate he uses "has its water of crystallisation driven off by heat, so as to reduce it one-half in weight; and in this condensed form, 47 grains are added to every pound weight of the Compound." That is to say, he employs 0.67 per cent. of some phosphate, about one-half of which may be regarded as phosphoric acid. We have no doubt of the accuracy of this statement; it agrees very nearly with the analysis above given. But what then? Such homœopathic doses are of no earthly use in gardening; and any mixture containing them may be considered, for practical purposes, to be wholly destitute of phosphoric acid.

† Vide the *Gard. Chron.*, vol. i., p. 732; vol. ii., p. 852; vol. iii., p. 52; and vol. iv., p. 212.

emplified in the one figured, but they were so closely placed, that as they grew they crowded each other until they appeared like one mass, often as large as the fruit of a Horsechesnut. On the 24th June, and for 10 days or more after, the flies kept hatching in multitudes, and of course, on opening the galls, I found the little pupæ curled up in their cells, where I had detected the larvæ in May. It is an exceedingly curious question, Where do the Gall-flies deposit their eggs at this season? I released at least 500 this morning (28th June) from the box containing the galls, all of which appeared to be males, although some were twice as large as others; on the following day many females hatched, but as there are no catkins upon the Oaks now for them to deposit their eggs in, what can be the nidus selected by the summer brood, which, there is every reason to believe, will die long before winter arrives, for many of the males lived only a few days in the box? It is certainly probable that some of the pupæ may lie dormant in the fallen galls until the ensuing spring, when they may issue forth in due time to puncture the male flower-buds of the Oaks, and thus proceed in their usual course; or it may be that a very few of the females hibernate, for if we reason from analogy, it seems incredible that such immense numbers should be doomed to die without depositing eggs, which are undoubtedly impregnated; yet it is evident if some extensive check were not given to these little animals, no Oak could escape, for they are still hatching in swarms from the few galls I received, and it is very important to observe that up to this time I have not detected a single parasitic fly amongst them; it is true that these may appear at a more convenient season, when the larvæ are in existence, and this I hope to ascertain.

The little fly of the woolly Oak-gall was named by Linnæus Cynips Quercus-ramuli; the *male* (fig. 1, the natural size being shown by the crossed lines, fig. 2), is shining, ochreous or fulvous; the antennæ are long, slender, and 15-jointed, the third joint being the longest; the head is subferruginous, brown at the base, with three large ocelli on the crown; eyes black; thorax with three brown patches before the middle; the scutellum is surrounded with chesnut brown; petiole short; abdomen much smaller than the thorax, intensely black and polished, the apex pointed, with an incurved aculeus capable of elongation; wings pubescent, superior, very long, with a costal cell, a triangular basal one, two submarginal cells, with an imperfect, minute, triangular areolet at their union, from which issues a nervure extending to the posterior margin; the pulvilli and claws are black. The *female* is stouter; the antennæ have only 14 joints; the abdomen is as large as the thorax, ovate-conic, but not acuminated, with an oviduct beneath; it is shining, fulvous, the basal segment only black. Fig. 3 exhibits one of the woolly galls with the anthers of the catkins more or less enveloped, one having a smaller gall produced near the extremity, fig. 4. Curtis's Brit. Ent. may be consulted for the descriptions and dissections of Cynips, pl. and fol. 688; and his Guide Gen., 564, for a list of the species.—*Ruricola.*

FRENCH CULTURE OF THE PELARGONIUM.

(Concluded from page 460.)

Raising from Seed.—The seeds should be sown in the year in which they are matured, or in the spring following. If the seeds have been taken early in July or August, you may sow them immediately; their produce will acquire strength enough to stand the winter, and most of them will bear flowers the following season. The mode of sowing is as follows. Fill pots or boxes within one inch of the top, with good earth well sifted and rather light, smooth it well on the surface, draw lines with your finger, put the seeds into each line, cover them lightly with the same earth, water them, and then place the pots or boxes on the steps in the greenhouse or under a frame. Take care to keep the earth constantly moist, and shade them from too much sun, which would harden the earth, and impede the vegetation. In fifteen or twenty days many of the seeds will be above ground. When the new plants have three or four leaves, put them separately into small pots, keeping as much earth as possible about the roots; water them and put them in a greenhouse or under a frame, shade them from too much sun for a few days, and in less than a week they will have taken root. If you wish to have stronger plants, to flower almost all the spring, put them in an old hot-bed in the open air; plant them in such a form that they may be covered with a glass; when they are perfectly rooted remove them sufficiently early to allow them to establish themselves in their new situations before the winter.

Insects hurtful to the Pelargonium.—If the aphis, or green fly, attacks the plants in the greenhouse, they are easily destroyed by a strong fumigation of tobacco; this should be done in the morning, when the plants are very dry. In this way plants may be preserved, without fearing that the smoke will injure the plants or flowers. There is another kind of insect which is very destructive to the Pelargonium, produced by a small butterfly, which deposits on the plant its eggs, which the heat of the greenhouse hatches in the autumn, and during the winter; these destroyers show themselves by the parenchyma of the leaves being eaten; there is no way of getting rid of them, except by looking for them attentively, and picking them off the plants; and they are very difficult to be seen, because they are usually of the colour of the plant which nourishes them. When the plants begin to show their first flowers, or a short time before, if you think that the fibres spread over the sides of the pot, they must be watered once or twice during the period of flowering, with liquid manure, or water which has percolated through good garden-mould; if the former be used (and it is decidedly preferable), that from the dung of cows is best. This precaution will considerably strengthen the plants during the whole time of their flowering. But such stimulants should not be applied after the buds appear, because they occasion too luxuriant growth of leaves, to the injury of the flowers; experience showing that plants, whose leaves have been too much developed, have fewer flowers, and those of a smaller size, than if the plant was less luxuriant. This observation applies not only to the Pelargonium, but to the Dahlia, and a number of other plants, which run too much to wood, and bear few flowers, when they are planted in a very rich soil. A second flowering of the Pelargonium may be obtained by putting only a part of the collection into the greenhouse; those that are left outside will begin to flower when those that are inside have ceased; these will perhaps be even finer, for it is known that the flowers which bloom in the open air, and under the direct influence of the light, have a more brilliant colour, supposing, of course, that the weather is warm and mild; otherwise, they must be taken in, and put with the rest, because warmth is necessary, in order to obtain large and well-blown flowers. By attention to the foregoing directions, no collection of plants will afford more pleasure than Pelargoniums.

Criterions.—A plant of high merit for propagation should be strong and healthy, not much inclined to run to wood, nor to grow tall; the peduncles slight, but sufficiently firm to support the truss, which ought to consist of from three to five flowers; each flower, clear in colour, should have five petals—two superior, two lateral, and one inferior; or, as it is generally expressed, two superior and three inferior petals. The principal colours are red, orange, rose, and carnation, with their gradations and shades; but lilac is not often admitted. Each of the superior petals must be entirely covered with a large crimson or black spot, well velveted in the centre, surmounted by carmine or lake, more or less deep; but the clearer the spot on the petal, and the more it resembles a fine piece of velvet, the greater its merit. M. Bataille has obtained some varieties in which a spot of the most beautiful velvet entirely covers the upper petals (with the exception of the edge), which spot is embroidered with a white zone that produces the most beautiful contrast. There are some kinds in which the five petals are spotted; it is particularly so in the dark colours, of which there has not yet been found a perfect flower; but as the colour of the lower petals is always lighter than that of the upper ones, so their spots are always less dark. All the petals should be of good substance, very smooth and well united, without any folds or tendency to curl much outwards when the flower is in bloom; and then it should assume as nearly as possible a circular form, which cannot be the case if the petals are narrow and lanceolated, with, of course, a considerable space between them.

Home Correspondence.

Peas.—In these improving times, when every man is expected to render his assistance in giving his mite of information, I beg to state the result of Early Peas as they have proved with me this season, hoping that it may be the means of eliciting from others the result of their experience, so that no one may be tempted in any way to be biassed by what I have myself proved to my satisfaction. Some years ago, but since I have been in practice, it was thought early to have Peas fit for table by George the Third's birthday (the 4th of June): since those days, in different parts of the country, I have gathered Peas from ten to twenty-one days earlier. After a long, dreary winter, every family seems to wish for young Peas as soon as they possibly can get them—no one finds fault on account of their being brought too early to table. In last November, having a south border of late Cauliflowers cleared off, and put into a place of protection for winter purposes, the border was trenched and formed into banks, which were left rough and open to sweeten for Early Peas; having great faith in the Early Warwick Pea for some years, a portion of the banks was sown on the 14th of December; the Peas were above ground on the 28th; in bloom, April 6th; stopped, that is, had their tops pinched off, on the 12th; and were gathered from on May 18th. The height was 4 feet 6 inches, the crop was heavy, and the pods well filled. They were mulched soon after the dry weather set in, which was the means of their continuing to produce good Peas for about thirty days. The banks were 5 feet apart. Cormack's Prince Albert was sown on banks on the same border on the 4th of January, 1844; they were up on the 14th; in bloom on the 1st April; and were gathered entirely on May 14th. I could have gathered a small dish on the 10th of May from them. This is a very prolific and fine-flavoured Pea. On the same day, and on the same border, another portion of the Warwick was sown. These, although having exactly the same treatment as the two above sowings, with regard to banks, hoeing, earthing, sheltering, sticking and watering, stopping or topping, &c., no favour being shown either to one or the other, were in bloom on the 13th of April, and gathered on the 28th of May. Although thus fairly treated, my old favourite Pea was fourteen days behind the Albert. About thirteen years ago I compared the Warwick on a long south border with several others; of these Early Peas, the Warwick proving itself then superior to the others, retained my favour ever since. Next year, should the Albert prove the same as it has done this year, I can only call the Warwick a Pea for a second crop. Last year I sowed the two above Peas on the same day, under the same preparation and management; the winter, however, was so mild, that they got too "gay," and were very much cut and crippled in the spring, but enough was left to fully prove the superior earliness of the Albert over the Warwick that time. With regard to Shilling's Grotto Pea I have not yet fairly proved its earliness. I sowed it this year to succeed others on an open quarter on the 4th of March. It was above ground on the 12th; in bloom on the 4th of May; and gathered on the 12th of June. Its height was 5 feet. It was not so prolific as the two above Peas. The pods with me were wide and rather short; but it is a fine-flavoured Pea, and of a beautiful colour when cooked.

I find great advantage by sowing Early Peas in the above method; first, they enjoy a greater portion of sun during the short days of winter and in spring; second, the earth lies dry, sweet, and wholesome; third, the banks break the wind from each other, so that the Peas lie well sheltered, although the banks are so sloped that the rows of Peas have the full enjoyment of all the sun; the banks are 5 feet apart, A, B, and C representing them; height of back sloped, 2 feet; sloping to the front, about 3 feet 6 inches; and the Peas are sown or transplanted 1 foot from the bottom. The above method is not only good for the Peas, but the border is so sweetened and pulverised by its being continually hoed, that the crop is sure to do well that succeeds the Peas.—*James Barnes, Bicton.*

Peach-trees.—With regard to "Omikron's" Peach-trees, Mr. Roberts (p. 389) imagines that I lay too much stress on the attacks of insects, and deep and stagnant borders; and he supposes that the cause of disease proceeds rather from ill-ripened wood. Now, this I never doubted: nearly all the evils to which the Peach is liable are traceable to this alone, and for this very reason I both practise and recommend the use of shallow borders, which I consider the very basis of all acclimatising; and this, with the chopped turf, is all that can be desired in that respect; with the latter there is a much greater freedom of root, and earlier action through the months of April and May, at the time I conceive it is much needed; for who would expect good fruit and healthy young wood from torpid roots, imbedded from one foot to three in putrid and stagnant soil? I therefore trust that I shall not be farther misunderstood, for let it be remembered that of the ten fundamental points, which I assumed in my answer to "Omikron" as sound maxims in the cultivation of the Peach, eight at least have a direct reference to the ripening of the wood. Indeed I may say that with me this is everything, and on this alone I rely. Mr. Roberts need be under no alarm about Peach-trees becoming too luxuriant in chopped turf,—such is assuredly not the case, as my trees abundantly prove; they are an exact medium as to strength, and gum is unknown to them; therefore there can be no harm in chopped turf. Perhaps I ought, however, to have written more guardedly. If turf was cut as thin as for turfing lawns, for this purpose, I should not be surprised to find the trees in a showery season too luxuriant; but the turf I use is, perhaps, from 4 to 6 inches thick, and being put in the hole in rough lumps, the water readily escapes. Turf used in this way retains its mechanical properties for many years, and if dug up at the end of ten or fifteen years, will be found of a much more mellow character than what is termed compost; which signifies good soils mischievously handled. I beg to assure Mr. Roberts, that the summer stopping, on which I presume the equalisation of the sap depends, is by no means productive of the evil consequences that he apprehends. When a shoot bursts into laterals, who can expect healthy blossom-buds above that point? It is tolerably evident, then, that this superabundant grossness is maintained at the expense of the lower portions of the

tree. As to flued walls, I admit their utility; but if we Northmen can produce fruit and trees equal to the genial climate of the Southern parts of the island, without the aid of flues, it at least argues in favour of the principles we adopt. I am sorry to see, at p. 389, the propriety of chopped turf disputed by Mr. Lawrence. He appeals to facts—so do I. However, I should expect just such results as actually took place, the border being three feet deep. It is, however, wrong to assume that because three feet of turf is too much, one foot must be the same. I beg to repeat that I plant on the mounds of brick or stone, and consequently have not above ten inches of soil in that part, increasing slightly in depth outwards, and that no trees can look better or have a finer crop of fruit: they have endured all the hot and dry weather without a single drop of water, and the walk over their roots is as hard as a turnpike road. This has taught me a lesson as to the habits of the Peach that I shall not easily forget. The assurance years ago, that what is called disease in the Peach is neither more nor less than ill-ripened wood, in the great majority of cases, led me to conclude that any soil which would insure an early action of root, combined with an early check or timely cessation of growth, would be most conducive to this end, and this I find most perfectly accomplished by my present plans. Trees situated as mine are, can never be glutted with moisture; they possess a steady and uniform existence, through the slowly progressive decay of the lumps of turf; manure being unknown, except as top-dressing in cases of exhaustion.—*Robert Errington.*

Vines.—Last season I renewed the Vines in one of my vineries, and in doing this I adopted a plan which I have not seen practised elsewhere. A hole was made in the parapet-wall under each sash, and a rod of the previous season's growth was passed out at one hole and in at another. The border was prepared as follows:—About a foot of the surface of the old border was removed, a small quantity of ashes was thrown in for drainage, and the bottom was then flagged with stones to the width of 2 feet from the wall; at the outside of this a barrier of flags was put up, and the space between this and the wall was divided into as many compartments as there were plants (or layers) in the house; these compartments were then filled in to the depth of 18 inches with prepared soil, the layers being covered about 8 inches; the border was then mulched over, and this finished the operation for the first two years. The 2 feet of soil I consider sufficient for the first two years; on the third, (*i. e.*, next season,) I shall remove the barrier, and with a fork take off part of the soil, to enable me to prune, examine, and arrange the roots, as may appear necessary; having done this, I shall place the barrier about a foot and a half further out, and fill the space up with fresh soil, in the same way as at first; this operation I intend to repeat annually. The advantages are—1st. I will not lose the use of the old Vines until the young ones are quite ready to take their place; 2d. I divide the labour of making the border, which is usually done in one year, over a number of years; 3d. I have a perfect command of the roots of my Vines, and can manage them with as much regularity as I can do the branches; 4th. Should it become necessary from any cause to remove an old Vine, or introduce a new one, it can be done without in the slightest degree interfering with its neighbour; and 5th. They have a fresh supply of soil to produce every crop, and should I wish to feed with liquid manure, I know exactly where to apply it effectually. This system might also be applied with advantage to wall-trees. It might be improved upon, in the case of forming a new house for early forcing, by leaving the compartments larger, and making a trench for fermenting materials, with pigeon-holed brick-work between the compartments, which would enable a temperature to be kept at the roots in some degree corresponding to that in the inside of the house. The connection between the layers and the old Vines was cut off a considerable time before the growing season was over, and the former were so well rooted that they never hung a leaf. They are now growing beautifully, and making as good wood as I could wish.—*W. W.*

Pine-apples.—For the information of "A. B. C." (p. 445), whose Pines have not fruited, I would suggest that if he was to turn his strongest plants in pots out into new tan, it would possibly start them into fruit, and also, in all probability, increase their size. The complaint about Pines not fruiting at the usual season is not new; but a complete remedy for this is at hand, not, however, in the unnatural practice of hungering the plants, neither is it in that of starving or disrooting them, but in encouraging rapid growth, thereby promoting complete development of the plant, and maturation of the fruit. At p. 53 of my "Treatise on the Pine-apple," is stated the result of my own practice. It consists in keeping the plant growing rapidly until the fruit is ripened off, which is usually in about eight or ten months after the Pines are planted out. I would also inform "A. B. C." that, if his plants should fruit this autumn, he may again fruit them in the following autumn. These facts I have a second time this season fully tested, at Thornfield—namely, that the Pine is capable of producing one fruit annually for any length of time. I shall soon be able to ascertain the result of an experiment made with two New Providence Pines—one I turned out into good compost, and the other I planted in the tan; the fruit of the latter is evidently swelling better, according to the size of the plant, than that of the former; and it has not half the size of crown.—*Joseph Hamilton, Thornfield.*

Tall Orchis.—An Orchis maculata measured 7⅛ inches long in the flower-spike, with the four topmost buds yet unexpanded; and 2 feet 3¼ inches high from the ground. Is not that an unusual size?—*A. H.* [Very.]

Bees.—I would suggest to the "Cottager," of West Dean, Sussex, that in future, when he has occasion to double his stock hives, he should place the empty hive over the other, instead of beneath it. Bees have a disposition to carry their stores upward, and if the "Cottager" had supered his stock, he would probably have found, when he harvested his honey, that the hive would have contained no brood. Under similar circumstances I had three supers last year, which, one with another, contained nearly 120 lbs. of honey-comb, uncontaminated by a single brood cell. If the "Cottager" decides upon removing his other super, as the family is populous, I recommend him to replace it by an empty hive, as swarming at this season should be discouraged. In answer to the question, Whether the bees will collect sufficient food for their winter sustenance in case of a protracted removal? I would observe that, if they have not already stored enough, or nearly so, in the nadir hive, which may be ascertained by weighing it, the probability is that the winter's supply of the bees will be deficient, and that they will require feeding. The inquiry, Whether an old stock will not work up as well as down? I have virtually answered already. The bees will work better up than down. I do not know what sized hives the pasturage of West Dean may require, but those described by the "Cottager" are very much too large for any district that ever came under my cognizance.—*Edward Bevan, Egair Evan, Newtown, Montgomeryshire.*

Bees.—In answer to "A Cottager," I have to say that if the bees have destroyed the drones,* he will not have any swarm, although the space is decreased. If the bees are deprived of part of their honey by the removal of a hive in connexion with the main stock, room ought at the same time to be given in some other place, if it is thought desirable to prevent swarming. The best way of managing bees is to have side hives, and when one side hive is taken, to place an empty hive on the other side. The side hives being only wanted for summer, may be made of old packing cases; the smaller they are the sooner they are filled. There should be a window with a shutter in the side hives, to know when they are fit to be taken. I have not had a single swarm since I have understood the conservative plan.—*C. A. A. Lloyd.*

Ants.—Who says there is no effectual remedy for these troublesome little pests? Arsenic and sugar!—Why, they delight in it. Take a saucer, smear the inside slightly with honey, place it inverted near their haunts; in an hour examine the saucer, and see if the honey be all gone; if not, let the saucer remain until it is. When it is all gone repeat it, and let them eat it off. Do this a third time; but now, when many are under the saucer feeding (and I have found hundreds), having with you a basin of boiling water, gently raise the saucer without turning it up, and hold it within an inch or two of the hot water; the Ants feeling the steam will drop, and of course die. Put the saucer, renewing the honey, in the same place, and in a quarter of an hour steam again, and so on, until you destroy all, which will be done in a very short time. According to the numbers two or three saucers may be used if wished; but I have found one always sufficient. By this means you kill all the workers, and by killing them, I need not say you destroy the colony.—*W. H. G.*

* This is usually done in July.

Societies.

HORTICULTURAL SOCIETY.

The last Exhibition of the season in the gardens at Chiswick took place on Saturday last. The day was very inauspicious, the rain beginning to fall just as the company began to enter the garden, and the "pitiless pelting of the storm" continuing with little intermission for hours after the company had left the grounds. This was very unfortunate, as the Exhibition was one of the very best we ever witnessed in July; and in addition to the usual attractions, the beautiful grounds of the noble President of the Society, His Grace the Duke of Devonshire, were thrown open to the public, though but few had courage to avail themselves of the privilege. The leading features of the Exhibition were the noble collections of Orchidaceæ from the gardens of S. Rucker, Esq., Messrs. Rollisson of Tooting, Mrs. Lawrence, Mrs. Marryat, and Mr. Cox of Stockwell; the Roses in Pots, from Mr. Beck and Messrs. Lane; the fine Collections of Plants, from Mrs. Lawrence, Mr. Frazer, Mr. Epps of Maidstone, and others; and the magnificent Collection of Fruit from all parts of the country. The Heaths, Pelargoniums, and Fuchsias, contributed much to enliven the scene, and the Florists' Flowers were not destitute of admirers.

The large Collection of Orchidaceous Plants sent by Mr. Mylam, gr. to S. Rucker, Esq., was very rich, both in novelty and beauty, and contained many noble specimens, evincing the very best management, and in the highest health. Among them were fine plants in perfect bloom of Stanhopea tigrina and cinnamonea, producing their singular flowers beneath the bottom of a wire-basket; the curious plant producing a yellow Maxillaria-like flower spotted with brown, called Scuticaria Steelii; the rare Anguloa Clowesii, producing a pale-yellow, or rather lemon-coloured flower; and a noble plant of Miltonia spectabilis, with 15 of its lovely blooms. He had, moreover, a very fine plant of Oncidium Lanceanum in beautiful bloom, with O. luridum guttatum, leucochilum, and pictum. Another very pretty plant was Zygopetalum crinitum cœruleum, which contained more blue in the flowers than is usual in this class of flowers; a curious plant, not quite in bloom, of Sarcanthus rostratus; and very pretty specimens of Cycnoches maculatum, Brassia Lawrenceana, and Lanceana very fine, with Angræcum bilobum, Cycnoches ventricosum, Lycaste Skinneri and macrophylla, Cycnoches chlorochilon, with pale-green flowers; Odontoglossum pulchellum very pretty, the curious Catasetum citrinum and luridum, Huntleya violacea, Maxillaria Warreana and vitellina, Epidendrum fragrans, Galeandra Bauerii, the singular Maxillaria stapelioides, and a species with very rich flowers called M. tetragona.—Of the curious genus Cirrhæa, there were three species, called picta, tristis, and Warreana, with very curious flowers hanging over the side of the pots, and which would have been better shown had they had a sheet of white paper placed beneath them; and, finally, there was a pretty specimen of the beautiful Stanhopea saccata.—The Collection from the nursery of Messrs. Rollisson, of Tooting, was scarcely less interesting than the preceding, and taken as a whole was very superior to the one produced by the same growers in June. Among them we noticed a fine variety of Calanthe, with rich violet flowers, called C. masuca; a new species or rather variety of Cymbidium, with large dark-brown flowers resembling C. aloifolium; Catasetum deltoideum, with very pretty dark-brown flowers; Stanhopea tigrina, and Wardii very fine; and a plant of Oncidium Lanceanum in fine bloom. Another very beautiful plant was Aerides quinquevulnerum, and there were also neat plants of Miltonia spectabilis, and the lovely Cattleya crispa. The same gentlemen also communicated Acropera Loddigesii, the singular Cycnoches Loddigesii, Epidendrum alatum, Lycaste tetragona, very curious; Isochilus linearis, Aspasia lunata, Rodriguezia recurva, Brassia Lanceana, and Oncidium luridum, all in fine health and bloom.—From the garden of Mrs. Lawrence, Mr. Robertson produced a magnificent plant, not quite sufficiently in bloom, of Peristeria alata, the Panama Dove plant; fine plants of Stanhopea eburnea, oculata, quadricornis; with Xylobium squalens, very curious; and a fine plant of the singular Mormodes citrinum, with yellow flowers. There was, moreover, a fine plant, in good bloom, of Acropera Loddigesii, Maxillaria Deppii, very good; with the curious M. stapelioides, and the pretty M. tetragona. Mormodes aromaticum was also produced, in fine condition; as were Galeandra Baueri, Epidendrum vitellinum, Brassia brachiata, very pretty; Catasetum Russellianum, Phaius albidus, in fine bloom; and Epidendrum odoratissimum. This collection of plants was in excellent health, and evinced superior management.—Mr. Redding, gr. to Mrs. Marryat, produced Stanhopea oculata, with six spikes of bloom, somewhat injured by the coldness of the day; S. grandiflora and tigrina, in good bloom; and tolerable plants of Epidendrum variegatum, Brassia Lanceana, Gongora nigrita, with very dark flowers; with Oncidium papilio, altissimum, and pulvinatum.—From the garden of Mr. Cox, of Stockwell, Mr. Don produced Rodriguezia secunda and recurva, Catasetum Russellianum, Calanthe masuca, Cattleya Harrisonii, in fine bloom; the lovely Stanhopea venusta, with Cycnoches chlorochilon, Phaius albus, Miltonia spectabilis, Oncidium flexuosum, and Cymbidium lancifolium.

Of single specimens of Orchidaceæ there was a splendid plant of Cattleya Loddigesii, with nine spikes of bloom, from Messrs. Veitch and Sons, of Exeter; Stanhopea oculata variety, with twenty flowers, from Messrs. Henderson, of Pine-apple Place; Vanda Roxburghi, a small plant, from Mr. Plant, gr. to H. Schroder, Esq., of Brixton; and a new species of Calanthe, with pale-violet flowers, called C. plantaginea, from Mr. Eyles, gr. to Sir George Larpent, at Putney Heath.

Only one large collection of Stove and Greenhouse Plants was produced, and that came from the garden of Mrs. Lawrence, at Ealing Park. It contained some beautiful plants, which were the more to be admired because they were full-formed specimens, plants that were fit to be seen on all sides, and had not been trained on the now too fashionable method of making one-sided plants, by training the branches to one side only, and leaving the back naked and ugly. Now, however much necessity there was for this method of training in years gone by, when plant cultivation was not quite so well understood as it is at the present time, it is quite certain there is no necessity for such deformity now, and we therefore hope another year to see such plants excluded from competition. The perfection of cultivation is to produce plants perfect on all sides; and although such plants may require more room and more care for their proper management, we think it cannot be denied that they would be very preferable to one-sided plants. While, however, we would insist upon plants being grown into perfect specimens, we must enter our protest against their being brought into proper form by the use of a forest of sticks. All plants ought to be grown so as to require, or at any rate exhibit, as few sticks for their support as possible. Pelargoniums may be grown without sticks, so may Heaths and most other hard-wooded plants. Fuchsias do not require them, and the more they are used the more is the elegant drooping habit of that beautiful flower destroyed. We mention these things here, because many otherwise handsome plants were completely spoiled by an unnecessary and unsightly use of sticks; and this was not confined to Fuchsias only, but to many of the stove and greenhouse plants, and even to some of the Heaths. To proceed with the collections, Mrs. Lawrence's contained a fine specimen of Æschynanthus maculatus, upwards of two feet in diameter, trained hemispherically, and liberally

covered with bloom; Besleria pulchella, a very pretty plant; Lasiandra petiolata, a plant three feet in diameter, and producing very pretty blue flowers; Phænocoma prolifera, a very fine specimen; Cuphea Melvillai, two large plants producing large scarlet flowers tipped with green; Pentas carnea, a dwarf and well-bloomed plant; Manettia cordifolia, very fine specimens described in our last report, but rather past their best; Statice macrophylla, with a fine spike of bloom; S. sinuata, a neat plant; and a very pretty specimen of Mirbelia ilicifolia.

In addition to the above, Mr. Robertson produced a remarkably fine plant of Vinca rosea ocellata in perfect bloom; Siphocampylus betulifolius, a good specimen; Achimenes grandiflora, a well-grown and noble specimen in most profuse bloom; two plants of Angelonia Gardneriana, producing prettily-spotted purple flowers, in long spikes, and a great abundance of them; a remarkably fine specimen, before noticed, of Leschenaultia formosa; Asclepias curassavica, a good specimen; a nice plant of Osbeckia chinensis, with rose-coloured flowers, Clerodendrum calamitosum, a pretty specimen; with a beautiful plant of Cassia corymbosa, and a number of other good plants. All that this collection required to render it perfect, especially on a dull day, was a greater number of various coloured flowers, as scarlet, orange, and yellow; but under the present regulations, it is almost impossible to introduce them.—The collection of plants from Mr. Frazer, of the Lea-bridge-road, was particularly remarkable for fine cultivation, and clean and excellent growth. Better taste had also been displayed in the selection of the colours, and also in their arrangement on the stage. The most remarkable plant was a very fine specimen of Kalosanthes coccinea, loaded with its bright-scarlet flowers; a very large and admirably-managed plant of Vinca rosea alba, in excellent bloom; Roella ciliata, an admirable plant, 18 ins. in diameter, and nearly the same in height, and covered with its beautiful pale blueish-purple flowers; Euthales macrophylla, a lovely plant, four feet high, and the same in diameter, densely covered with beautiful yellow flowers; Angelonia Gardneriana, a very handsome plant; with Crowea saligna, in fine bloom, and good plants of Vinca rosea, and Gardoquia Hookeri, a plant which, generally, is not blooming in good condition this season. Mr. Fraser had also plants in excellent condition of Boronia viminea and Leschenaultia formosa.—Mr. Epps, of the Bower Nursery, Maidstone, contributed a group of 15 plants, among which were some new things, and well-grown specimens of Coleonema rubrum; a fine plant, well bloomed, of Sollya heterophylla; Clerodendrum squamatum, a very dwarf plant, with two spikes of bloom; an admirably-bloomed specimen of Achimenes multiflora; and a tolerable plant of Achimenes grandiflora, apparently from a single crown this season.—Mr. Epps sent a very pretty specimen of Brugmansia floribunda, with orange flowers; a neat plant of Gloxinia Cartoni; and good plants in profuse bloom of Begonia parviflora, Torenia scabra, and Vinca rosea and rosea alba. For a new beginner, this collection was very creditable, especially considering it had been conveyed upwards of 40 miles to the place of exhibition.—Mr. Green, gr. to Sir E. Antrobus, Bart., and Mr. Redding, gr. to Mrs. Marryat, produced collections in the 15th Class, but neither were particularly remarkable. Mr. Green's contained two handsome plants, and these were Coleonema rubrum and Stephanotus floribundus. — Groups of six plants were shown by Mr. Bruce, gr. to Boyd Miller, Esq., of Mitcham, Mr. Slowe, gr. to W. R. Baker, Esq., Bayfordbury Park, Herts, Mr. Stanley, gr. to H. Berens, Esq., Sidcup, Kent, and Mr. Cox of Stockwell. Mr. Bruce's plants were, a very admirable specimen of Pentas carnea, said to have been grown in the open air; Achimenes longiflora, the flowers most beautifully coloured; Aphelexis humilis, a lovely plant; Clerodendrum squamatum, well-grown; and good plants of the old Phymatanthus or Pelargonium tricolor, and Pimelea decussata. The best plants in Mr. Slowe's collection were Bossiæa linophylla, not quite sufficiently in bloom; Crowea saligna, a promising plant; Swainsona galegifolia; Vinca alba; and Campanula Barrellieri.—Mr. Stanley had fine plants: Leschenaultia formosa, Gloxinia Menziesii, and Niphæa oblonga; but Begonia parviflora, Achimenes rosea, and Vinca ocellata, in the same collection, were spoilt by the injudicious use of sticks.—Mr. Cox's collection was not remarkable.

Of CLIMBING PLANTS, only one collection was produced, and that came from Mr. Frazer. It contained a very handsome specimen of Allamanda cathartica; excellent plants, Sollya angustifolia and linearis, with Manettia cordifolia, Hoya carnosa, and Stephanotus floribundus.

From the Nursery of Mr. Jackson, of Kingston, were a collection of Statices, consisting of S. sinuata, a very pretty species; Pseudo-armeria, a variety with pink flowers, said to be hardy; with S. Gmelini mucronata, Dickensoni, arborea and incana.—Messrs. Mountjoy, of Ealing, sent 12 very fine plants of Lilium eximium, in beautiful bloom, and 6 remarkably well-grown specimens of Gloxinia rubra and maxima alba, most profusely covered with bloom.—Mr. Dobson, gr. to Mr. Beck, of Isleworth, sent 7 very fine plants of Achimenes, but with rather pale flowers; and Mr. Cuthill, Nurseryman, of Camberwell, 10 beautifully grown plants of Kalosanthus Russellianus, a plant for the successful cultivation of which he has been so long celebrated.

Among NEW PLANTS the most remarkable was a specimen from Mr. Robertson, called Saurauja spectabilis. It had large, thick, rusty-looking leaves, and flowers in large bunches resembling Spiræa ariæfolia, but shorter in the bunch, and deliciously sweet-scented. Another curious new plant Chiococca racemosa, was produced by Mr. Eyles, gr. to Sir George Larpent. It had small yellow flowers, which were abundantly produced.—Mr. Gad, gr. to Thomas Lenox, Esq., of Plaistow, Essex, communicated a plant of Brugmansia floribunda, in good bloom; Messrs. Mountjoy, a plant of Gloxinia cerina, with pale pink flowers, and said to be a half-bred Sinningia; Mr. Stanley, a species of Thysanotus, the flowers of which open early in the day, but close towards noon; and Mr. Jackson, a plant of Gesneria, with particularly bright scarlet flowers, which were profusely produced.—From the Nursery of Mr. Frazer was a plant of Gompholobium splendens, with yellow flowers; and Mr. Ayres, gr. to James Cook, Esq., sent a plant of a hybrid Achimenes, said to have been raised between A. rosea and coccinea, and called A. Beatoni. It was too near A. coccinea.—Mr. Miller, of the Providence Nursery, Ramsgate, sent a large plant of Petunia punctata, which fully realised all that has been said of it. The flowers open of a bluish purple colour, but as they advance in age become marked or blotched with white, and this change continues until the flowers at last are almost wholly white. The plants, however, which we have seen in the open borders, do not at present show any of the spotted character, but continue a dirty purple until they decay; so that, though the plant may do as a curiosity for pot culture, it will never be of any use for bedding out; indeed, to make the most of it, the spotted ones are but faded flowers. A number of other plants were shown in this class, but, unfortunately for the exhibitors, they were entered wrong, and consequently no award of prizes was made to them.

Of SINGLE SPECIMENS, some remarkable plants were exhibited, especially a large specimen of Gloriosa superba, upwards of six feet high, and in splendid bloom. This was by far the best pot specimen of this plant we ever saw, but through a mis-entry no prize was awarded to it.—A very curious plant with pink flowers protruding from all parts of the old wood of the plant, even from the surface of the pot to the extreme point, was sent by Mr. Robertson, and called Medinilla erythrophylla; he had another beautiful and singular plant, called Lemonia spectabilis.—From the Nursery of Mr. Frazer was a magnificent specimen of Crowea saligna, in excellent health; and Mr. Hyde, gr. to B. Cotton, Esq., sent a noble specimen of Lisianthus Russellianus, covered with upwards of three hundred flower-buds.—Mr. Bailey, gr. to His Grace the Archbishop of York, sent two exceedingly well-grown plants of Kalosanthes nitida, and grandiflora minuata; they were three feet high and three feet in diameter, but the bloom was not in proportion to the size of the plants. They were, however, admirable specimens of cultivation, and deserving of all praise.—Statice sinuata, a lovely specimen, was communicated by Mr. Jackson; Achimenes longiflora, remarkably good, by Mr. Bruce; and A. longiflora and grandiflora, superlatively excellent, by Mr. Robertson.—Sedum tortuosum came from Mr. Doran, gr. to Thos. Hawes, Esq.; and Leschenaultia formosa, from Mr. Poole, of Leyton, Essex.—A fine plant of Sollya linearis, was sent by Mr. Hopgood, of Bayswater; Tristania neriifolia, with yellow flowers, by Mr. May, of Woodford; Erica ampullacea, a splendid plant, by Mr. Dawson, of Brixton Hill; E. tricolor superba, by Messrs. Henderson; and E. tricolor elegans radiata, an excellent plant, and eximia, a fine specimen, by Mr. Robertson, who also sent a grand plant, 10 feet high, of Nepenthes distillatoria, the singular Pitcher plant, which was covered with pitchers, and was very much admired. The curious Erica tetragona, and a tolerable plant of E. eximia, were sent by Mr. Hudson.

A number of Collections of HEATHS were shown by various persons, and among them were some admirable specimens.—Mr. Robertson produced fine plants of Parmenteriana rosea; gemmifera, in fine bloom; depressa, an excellent specimen, in perfect health and bloom; viridiflora, with green flowers, a good plant; cerinthoides major, an excellent plant; jasminiflora alba, a good plant, in perfect bloom; Cavendishii and ampullacea, both good; a nice plant of obbata, and another of ampullacea vittata. Mr. Robertson had, moreover, good plants of a variety called Lannonii, with ventricosa rosea, globosa, and superba; and also eximia radiata, tricolor elegans, and inflata alba.—Mr. Jackson's collection consisted of E. ampullacea and a. rubra; cerinthoides, a fine plant; Westphalingia, in fine health and bloom; jasminiflora alba; Jacksoni, a fine plant; Massoni, in good bloom; tricolor superba, fine; and a seedling variety, equally good; ventricosa Bothwelliana and purpurea, both very large; with inflata, princeps, eximia, and gemmifera, in good health. Mr. Jackson also sent a large plant of E. jubata, 4 feet high, and 4 feet through, very fine; a seedling from Shannonii, a good variety; and also ampullacea vittata, in good bloom. Most of these plants were large, and some of the collection a little past their best.—Messrs. Fairbairn, Nurserymen, of Clapham, sent a collection of very prettily grown small specimens: the best of them were jasminiflora alba, ampullacea, a. vittata, eximia, cubica major, inflata, Irbyana, Shannoniana, princeps, procumbens, tricolor (Lee's), tricolor elegans, impulsa, sanguinolenta, and the pretty little Savilliana. These plants were in excellent health, and promise to make admirable specimens.—From Mr. Epps, of Maidstone, the plants consisted of tricolor; tricolor (Lee's), a good plant, Savilliana, ventricosa superba, carnea, globosa and rosea, gemmifera, eximia, jubata, jasminiflora alba, inflata, metuliflora bicolor, Templeana, ampullacea, and ampullacea rubra. These, like the preceding, were principally plants in their second year's growth, and had been potted, for the most part, on the "one-shift system."—Another collection of 20 plants was sent by Mr. Green; it contained good plants of elegans and eximia, Cavendishii, ampullacea, Shannonii, ventricosa superba, viridiflora, metuliflora bicolor, tricolor elegans (a fine plant); inflata, Massonii, well bloomed; ampullacea vittata, with Coventryana, parmenteriana rosea, depressa, and jasminoides.—In the groups of 6 plants, Mr. Bruce sent a good specimen of tricolor elegans; princeps, very pretty; Irbyana, viridiflora, ampullacea, and a good plant of eximia.—A Collection, consisting of small plants of E. rubens, viridiflora, ampullacea, Irbyana, eximia, and Jasminoides, was sent by Mr. Doran.—In the Nurserymen's Class, Mr. Frazer produced E. rubens, eximia, Parmenteriana rosea, Irbyana, Westphalingia, and ampullacea superba; Mr. Dawson, of Brixton, a splendid E. Irbyana, Massonii fine, with Savilliana jasminiflora, ampullacea major, and a variety miscalled infundibuliformis. Among others, Mr. Glendinning, of the Chiswick Nursery, had ampullacea vittata, tricolor carnosa, ventricosa breviflora, pulcherrima, inflata, and ampullacea.

ROSES IN POTS were shown by Mr. Dobson, gr. to Mr. Beck; and Messrs. Lane and Sons, of Berkhampstead. They were not so good as at former meetings, while the kinds were nearly the same; and indeed the pot culture of this popular flower has been confined too much to those kinds which it was known would grow in pots, while those kinds about the management of which there is some doubt have been to a great extent neglected. Another season we hope to see prizes for large collections, and also for (say six plants) of each class of Hybrid China, Gallica, H. Bourbon, Bourbon, Moss, China, Tea, &c. In this manner all the popular tribes will be properly represented, and the cultivation will not, as is the case now to a great extent, be confined to certain popular varieties. The best of the kinds sent by Mr. Dobson were Elise Sauvage, Barbon, General Allard, Queen of the Bourbons, Highclere seedling, resembling Devoniensis, Celimene, and Augustine Mayet. The plants were healthy and clean, but the flowers rather destitute of colour. Messrs. Lane's Collection consisted of Psyche, Charles Duval, Elise Sauvage, Fabvier, Mirabile, Comte d'Osmond, Triomphe de Luxembourg, Napoleon, Duc d'Aumale, Emilie Courtier, Princess de Mecklenberg, Cramoisie superieure, Diana Vernon, Proserpine, Taglioni, and Gouda. Some of Messrs. Lane's plants were not so clean as they might have been, but generally they evinced good management.

Of CUT ROSES, those from Messrs. Paul, of Cheshunt, were the finest, and were exhibited in large groups of a dozen or more flowers, and being placed single had a very fine effect. They consisted of Charles Duval, Jaune Desprez, Bouquet à Flore, Crested Provence, Wm. Jesse, Lamarque, General Allard, Grain d'Or, Madame Deschoulteres, Celimene, Amiable Queen, Icheymaker, Nannette, Acidalie, Emilie Courtier, Félicité perpétuel, Edward Jesse, Eugene Beauharnais, Josephine Malton, Aubernoir, African Black, Duchess of Sutherland, Mrs. Bosanquet, Charles Sir, Niphets, a splendid kind, Madame Nerard, Louis-Buonaparte, Miss Elliot, Devoniensis, Perpetual Rivers, Paul Joseph Augustine Lelieur, Jaune, Comte de Paris, Madame Laffay, Bourbon Queen, Proserpine, Fleur d'Amour, Lady Stewart, Marie de Nerra, Pompone bicolor, Enchantress, and Ne plus Ultra.—Messrs. Lane's varieties consisted of the following:—They were fine flowers, and arranged in rows across the box, after the manner of Messrs. Lee at the June *fête*; Devoniensis, General Christiana, Grandissima, Duchess Montebello, Prince de Provence, Blush Provence, D'Angrusseau, Duc de Trevise, Charles Duval, White Globe Hip, Belle de Rosny, Cynthe, Chatelaine, Paul Joseph, Queen, Lafite, La Seduisante, Berryer, Gen. Foy, Boula de Nanteuil, Triomphe de la guerre, Ohl, Eugene Barbot, Bizarre Marbre, Queen of Denmark, Madam Hardy, Lady A. Peel, Duchess of Sutherland, William Jesse, Prince of Wales, Aubernon, Robin Hood, Madame Laffay, and Miss Elliott.—The kinds sent by Messrs. H. and C. Cobbett, Nurserymen, of Chobham, near Bagshot, were William Jesse, Madame Laffay, Nuralba, Royal Provence, Unique Provence, Victor Hugo, Bouquet de Flore, Lady Warrender, Armosa, Acidalie, Madame Desprez, Félicité perpétuel, Village Maid, Madame Marana, General Allard, and Elise Sauvege. The arrangement of this Collection was rather confused, and many of the kinds were overblown flowers.—From Mr. Francis, Nurseryman, of Hertford, were a collection of twenty-five good Roses, consisting of Jaune Desprez, Augustine Lelieur, Rose du Roi, Belle Marie, Lamarque, Madame Laffay, Queen of Denmark, Triomphe de Plantier, Latifolia, Louis-Buonaparte, Madam Newman, William Jesse, General Lamarque, Devoniensis, General Soyez, Leopold, Chatelaine, Beauty of Billiard, Elise Sauvage, Princess Helene, Lady Fordwich, Queen of Bourbons, and Comte de Paris. — Mr. Cripps produced a small collection, and the best flowers were Euphrosine, Nelly, New Village Maid, Triomphe des Dames, Prudence Rœser, Armide, Jaune Desprez, Madame Laffay, Bourbon Queen, Leopold, William Jesse, Lyonnaise, L'Anglaise, La Pactole, Daphne, and La Colambraine.—Moss Roses were produced by Messrs. Lane and Cobbet, but the latter were certainly inferior. Messrs. Lane's consisted of Crimson, Mottled, Crested, Perpetual White, Prolific, Luxembourg, Malvina, White Bath, Common, Eclatante, and Aspase; and the best of Messrs. Cobbett's were Unique, Prolific, Luxembourg, Blush, and Mousseuse Partout. But few collections of Roses were produced by Ama-

teurs, and some of them were so incorrectly named that we did not take a note of them. The best were from Mr. Slowe, of Bayfordbury Park; and Mr. Buttery, gr. to F. Raymond Symonds, Esq., Norbiton Park. Surrey. Mr. Slowe's consisted of Cerise, Bourbon Queen, Beauharnais, Madame Laffay, Cramoisie superieure, Hymene, Paris, Goubalt, Carmine Superb, Elise Sauvage, Gigantesque, Marjolin, Mrs. Bosanquet, and Caroline. Mr. Buttery's comprised Crimson Perpetual, Aimé Vibert, Emilie Courtier, Beauty of Billiard, Queen of Bourbons, Augustine Marjet, Mrs. Bosanquet, Jaune Desprez, Cramoisie superieure, Triomphe de Plantier, Unique, Fabvier, Phœnix, Armosa, Crimson, Madame Desprez, and Euphrosine. —Mr. Wilson, gr. to Lord Howe, at Gopsall, and Alexander Rowland, Esq., also contributed Roses; but their flowers were over-blown, and neither collection contained any very remarkable kinds, which have not been before noticed.—Mr. Cock, of Chiswick, sent some fine Balsams in small pots; and two magnificently-grand Wardian cases were sent for exhibition by Mr. Potts, of Shrewsbury; they were glazed with the finest sheet-glass, and the framework, which was Gothic, was all gilded. We cannot imagine a finer piece of furniture for a drawing-room than one of these cases, nor a finer habitation for plants while in the drawing-room.

We have had so much to say in favour of the excellence of the FRUIT on former occasions, that at the present time we are at a loss for words to express our admiration of it. We might be very concise, and in a few words say it was all excellent, and that would be the truth; but as there was some variety as to the degrees of excellence, we must in justice to the exhibitors enter into a detailed account. In former years it has been necessary to remind fruit cultivators of the importance of their maintaining the character of English gardeners in the fruit department, but this season they have come voluntarily forward and proved how excellent their management is. We were happy to remark among the exhibitors the gardeners of their Majesties the Queen and Queen Dowager.—In the Collections, Mr. Spencer, gr. to the Marquis of Lansdowne, exhibited a number of magnificent Providence and Queen Pines, fine Cannon Hall, Muscat, Black Hamburgh, and Frontignan Grapes, excellent Cabul Melons, with beautifully-coloured and ripened Elruge Nectarines, and Bellegarde and Noblesse Peaches. To this collection the first Prize was awarded, and certainly it was highly deserving of it, for the fruit was perfect.—Mr. Henderson, gr. to Sir George Beaumont, had fine Queen Pines, but not so well swelled as usual; excellent Black Hamburgh Grapes, Melons, with Elruge Nectarines, and Strawberries, and Cherries.—Mr. Dods, gr. to Sir George Warrender, also sent fine Pines, Melons, Black Hamburgh and Muscat Grapes, very good, with Peaches, Nectarines, Cherries, and Currants. —From the garden of J. H. Oughton, Esq., Elm Grove, Roehampton, Mr. Parker produced very good Black Hamburgh, Black St. Peter's, and Muscat Grapes, with magnificent Nectarines and Peaches, and some fine Melons.—Black Hamburgh and Muscat Grapes, and some excellent Melons, were sent by Mr. Bailey, gr. to the Archbishop of York; good Melons, Strawberries, Cherries, Currants, and Golden Harvey Apples in excellent preservation, by Mr. Davis, gr. to J. Disney, Esq.; and a tolerable collection of fruit came from Mr. Peddrick, gr. to H. Pownall, Esq.—The Pines were all good, but the most perfect specimen in the exhibition was a Queen grown by Mr. Hamp, gr. to Jas. Thorn, Esq. This, we were informed by Mr. Hamp, had been grown on the tank system of heating, and certainly the fruit was as fine as could be desired.—Mr. M'Ewen, gr. to Colonel Wyndham, at Petworth, sent very excellent Providence and Queen Pines.—Mr. Parsons, gr. to A. George, Esq., the same; and very superior Providence Pines also came from Mr. Belton, gr. to C. Winn, Esq., of Nostell Priory.—Mr. Sellers, gr. to L. V. Watkins, Esq., had some fine Envilles; Mr. Henderson, and Mr. Dods, gr. to Col. Baker, some fine Queens; and Mr. Gunter and Mr. Wilmot, of Isleworth, sent some very fine fruit.—Mr. Brown, gr. to C. W. Packe, Esq., contributed some good Providence Pines; Mr. Dryden some good Enville and Providence; but the Enville, Providence, and Otaheite Pines from the garden of Lady Rolle, at Bicton, did not maintain the character of that establishment.—Of Grapes, the finest were from Mr. Dytche, gr. to Sir F. Goodricke, and Mr. Hamp; but very admirable fruit, a little injured by packing, was also sent by Mr. Robinson, gr. to A. Sinclair, Esq., of Liverpool; Mr. Ingram, of the Royal Gardens, Windsor, whose sort was called the Royal Albert, and was grown in a pot; Mr. Atlee, gr. to H. Beaufoy, Esq.; Mr. Dods; Mr. E. Davies, gr. to G. Smith, Esq.; Mr. Umpleby, gr. to H. Benyon, Esq., Leeds; Mr. Godfrey, gr. to the Earl of Limerick, and Mr. Parsons. Other Grapes were sent by Mr. Dods; Mr. Wilson, gr. to Lord Howe; Mr. Taylor, gr. to J. Coster, Esq.; Mr. Henderson; Mr. M'Lean, gr. to the Marquess of Downshire; Mr. Smith, gr. to Sir G. Ansley; and Mr. Gibson, gr. to Her Majesty the Queen Dowager.—Of Market Gardeners, very excellent fruit was sent by Mr. Davis, of Barnet; Mr. Wilmot, Mr. Mitchell, of Brighton; Mr. Chapman, of Lambeth; and Mr. Gunter.—In Peaches, some admirable fruit were sent by Mr. Snow, gr. to Earl de Grey; and very excellent Peaches and Nectarines by Mr. Spencer; Mr. Ewing, gr. to O. F. Meyrick, Esq.; Mr. Ferguson, gr. to the Duke of Buckingham; Mr. Fleming, gr. to the Duke of Sutherland; and Mr. Davis, of Oak-hill, Barnet. Some very good Peaches and Nectarines were also sent by Mr. Collins, gr. to E. H. Chapman, Esq.; and Mr. Foggo, gr. the Marquis of Abercorn.—The Melons especially were exceedingly fine; but as no Prize was awarded, we suppose the internal examination did not satisfy the Judges. —Mr. Fleming sent two very fine Cabul Melons, weighing 10 lbs. each; Mr. Mitchell, gr. to Lord Vernon, sent a very splendid specimen of the Hoosainee; and Mr. Spencer, two remarkably fine fruit of the Beechwood. Mr. M'Ewen and Mr. Graham had likewise some good Beechwood; and other good-looking Melons were sent by Mr. Marton, Thames Bank, Pimlico; Mr. Bance, gr. to Dr. Tarleton, Mr. Gibson, and Mr. Fish, gr. to H. Oddie, Esq.—A bunch of the fruit of Musa Cavendishii was from the Garden of the Society; and of miscellaneous fruit, some fine Greengage Plums were sent from Her Majesty's Gardens, Windsor.—Figs, remarkably fine, but unknown, from Mr. M'Ewen; Cherries, by Mr Meyers, of Brentford, Mr. Redding, and Mr. Baxter; and Circassian Cherries, by Mr. Peddrick.—Fastolff Raspberries were sent by Messrs. Youell; and others, nearly as good, by the Hon. and Rev. R. Wilson.—Mr. Stanley, gr. to H. Berens, Esq., sent fine Citrons; and Mr. Caldwell, a remarkably well-grown Orange.—Some fine Myatt's Pine Strawberries were sent by Mr. Redding; Turner's Pine, by Mr. Turner, of Brentford; Apples, well preserved, by Mr. J. Fish; Cherries, by Mr. Jones, gr. to Sir Moore Disney, and Mr. Elliott, gr. to T. B. Boothby, Esq.; Elton and Turner's Pine Strawberries, by Mr. Jones; Citron des Carmes Pears, by Mr. M'Ewen; and some handsome Cucumbers, by Mr. Mills, not sent for competition, grown in his improved pit, heated by Burbidge and Healy's boilers and tank, "in the short period of 20 days from the time of planting."—Gooseberries were sent by Mr. Meyers, of Brentford; and some seedling varieties, by Mr. J. Fish.

We must not omit some beautiful HONEYCOMB, obtained at Dover, in Nutt's boxes, and exhibited by Mr. Geo. Neighbour, of Holborn.

Though not so numerous as at the two former Exhibitions, and the season having been a very long one, the display of PELARGONIUMS reflected great credit upon the growers, for having produced them in such fine condition as to health, and quantity of bloom. In the Amateurs' class of 12 new and first-rate varieties, in pots of 24 to the cast, *the Gold Banksian* in this class was taken by Mr. Stains, whose collection contained the following sorts:—Sunbeam, Roulette, Superbum, Queen of the East, Rising Sun, Alice Gray, Fair Maid of Devon, Duke of Cornwall, Nestor, Wonder of the West, Matilda, and Wonder.—*The Silver Gilt* was awarded to Mr. Cock for Madame Taglioni, Pulchellum, Unit, Juliet, Sylph, Conflagration, Sir R. Peel, Black Dwarf, Symmetry, Laura, Hector, and Jessie.

In the NUSERYMEN'S CLASS the *Gold Banksian* was awarded to Mr. Catleugh, his collection consisting of Rosetta superb, Tipili, Unit, Nestor, Pandora, Queen of the Fairies, Witch, Dara, Symmetry, Victoria, Beauty, and Grand Monarch.—*The Silver Gilt*, Mr. Gaines, Battersea, for Witch, Miss Louisa Stanley, Excelsum, Fair Maid of Devon, Glory of Jersey, Egbert, Rising Sun, Elegans Novum, Madeleine, Albina, White Surrey, and King of Saxony. The two collections of 12 varieties in 12-sized pots, were from Mr. Catleugh and Mr. Gaines; the former taking *the Silver Gilt Medal* for Nestor, Selina, Sapphire, Queen of Fairies, Dido, Lord Mayor, Madeleine, Matilda, Tasso, Armenia, Constellation, and Cyrus superb.—Mr. Gaines received the *Large Silver* for Madeleine, Egbert, Lady Isabella Douglas, Rising Sun, Cid, Antiope, Mabel, Triumphant, Album perfectum, Erectum, Floridum, and Cyrus.

The exhibition of FUCHSIAS was greater than we had seen brought together at any former period, and many fine and magnificent specimens were exhibited; but good as they were, we could not but feel that there was too great a similarity in the colour, and these elegant flowers will never make an effective display, unless the sorts are judiciously chosen, and a watchful regard paid to contrast of colour. Each collection should contain the greatest range of variety the flower possesses.—The *Large Silver Medal* was awarded to Mr. Gaines, and to Mr. Laing, of Twickenham; the former collection was composed of Decora, Nobilissima, Britannia, Alata, Eclipse, Robusta, Paragon, Eppsii, Champion, Pulcherrima, and Defiance; and the latter of Venus Victrix, Eppsii, Dalstoni, Victory, Stanwelliana, Defiance, Bridegroom, Kentish Hero, Insignis, Conspicua arborea, Chandlerii, and Magnifica.—*The Silver Knightian*, to Mr. Ayres, gr. to W. Cook, Esq., Brooklands, Blackheath, for Attractor, Balloonii, Stanwelliana, Epps's Marie, King John, Eppsii, Speciosa, Globosa major, Elegans, Exoniensis, Excelsa, and Duke of Wellington.—*The Same Medal* was also awarded to Mr. Kendall, of Stoke Newington, for Formosa elegans, Venus Victrix, Brockmannii, Eppsii, Stanwelliana, Compacta, Britannia, Defiance, Eclipse, Alata, Victory, and Robusta.—*The Silver Banksian Medal*, to Messrs. Lane and Son, for Laneii, Pulcherrima, Robusta, Defiance, Exoniensis, Magnifica, Fulgens, Paragon, Alata, Britannia, Brockmannii, and Eppsii; and the *same Medal* for the collection from Messrs. Henderson, Pine-apple-place, which contained the following flowers:—Le Chinois, Pulcherrima, Tricolor, Formosa elegans, Rosea elegans, Chauverii, Majestica, Closiot, Eppsii, Defiance, Lady Walsingham, and Venus Victrix.

The Collections of PICOTEES and CARNATIONS appeared to afford general gratification; there was an excellent display of these beautiful flowers, which are unquestionably rising in public estimation. In the Amateurs' Class the *Large Silver* was awarded to Mr. C. Embleton, gr. to T. Barnard, Esq., whose stand contained the following varieties:—Wilmer's Prince Royal, John's Prince Albert, Sharp's Gem, Barnard's Mrs. Barnard, and Lady Douro, Dickson's Bride, and Trip to Cambridge, Wildman's Isabella, Burrough's Lady Douro, Robinson's Nottingham Hero, Sharp's Wellington, La Delicate, and Read's Favourite, Burrough's Mrs. Bevan, Waine's Victoria, Brinkler's Lady Chesterfield, Gidden's Miss Desborough, Teaser, and Vespasian, Hogg's Queen of England, Burrough's Lady Peel, and Mrs. Benyon, Ely's Marquess of Waterford, and Annersley's Sanspariel.—G. Edmonds, Esq., Wandsworth, received the *Silver Knightian Medal* for Willmer's Prince Royal, Barrand's Bride, Borderer, and Eclipse, Burrough's Mrs. Bevan, Annersley's Sanspariel and Mrs. Willoughby, Jessop's Sir W. Middleton, Cox's Victoria Regina, Wildman's Isabella, Wain's Victoria, Dickson's Trip to Cambridge, Kirtland's Wellington and Princess Augusta, Wood's Lady St. John, John's Prince Albert, Gidden's Sir R. Peel, Princess Royal, Teaser, and Don Juan, Lady Flower, Garrat's Lady Dacre, Brinkler's Conductor, and Crask's Queen Victoria.—In the Nurserymen's Class, the *Large Silver Medal* was awarded to Mr. J. Dickson, of Acre-lane, whose stand contained as follows:—Barrand's Portia and Cornelius, Sharp's Gem, Criterion, La Delicate, and Agitator, Dickson's No. 10, No. 2, Lady Jane Grey, Charles Stamford, No. 8, and No. 6, Burrough's Mrs. Bevan, Gidden's Vespasian, Hero of Nottingham, Wildman's Isabella, Gidden's Lydia and Teaser, Kirtland's Princess Augusta of Cambridge, Beauty of Reading, Queen Victoria, and Duke of Wellington, Wain's Queen Victoria, and Willmer's Prince Royal.—The 2d Prize, *Silver Knightian Medal*, was awarded to Messrs. Norman of Woolwich, for Ely's Field Marshall, Halliday's Henrietta, Crask's Victoria, Wain's Queen Victoria, Dickson's Trip to Cambridge, Sharp's Gem, Barrand's Bride and Eclipse, Norwich Rival, Barnard's Mrs. Barnard, Wildman's Isabella, Burrough's Lady Flower and Lady Douro, Bennet's Seedling, Garrat's Champion, Woolwich Beauty, Gidden's Vespasian, Lady Dacre, Purpurea elegans, Halliday's Fair Phillis, Sharp's Invincible, Robinson's Duke of Wellington, Lovegrove's No. 5, and Purple Perfection. *Silver Banksian.*—Mr. H. Ward, Woolwich, for Martin's Prince Albert, Gidden's Lady Dacre, Burrough's Lady Flower, and Mrs. Bevan, Green's Queen, Crask's Victoria, Annette, Trude's Queen Victoria, John's Prince Albert, Wilson's Miss Fanny Irby, Brinkler's Lady Chesterfield, Barnard's Mrs Barnard, Martin's Queen of Violets, Willmer's Prince Royal, Sharp's Invincible, and Countess De Grey, Gidden's Vespasian, Burrow's Jim Crow, Seedling, Purple Perfection, Dickson's Trip to Cambridge, Wain's Queen Victoria, Wood's Lord Hitchbrooke; and *the same Medal* to Mr. Willmer of Sunbury, whose collection consisted of Gidden's Sir R. Peel, Miss Desborough and Vespasian, Hufton's Queen of Sheba, Burrough's Miss Jane, and Aurora, Willmer's Queen, Barrand's Portia, Cornelius and Borderer, Dickson's Trip to Cambridge, Brinkler's Fairy Queen, Willmer's Peter the Great, Miss Browning, and Prince Royal, No. 10. Sharp's Cleopatra, Kirtland's Princess Augusta, Trude's Queen Victoria, Ely's Mrs. Horner, Field Marshall and Marquess of Waterford, Hogg's Lady Acland, and Newell's Harlequin. CARNATIONS.—*The Large Silver*, in the Amateurs' Class, was awarded to Mr. Embleton, gr. to J. Barnard, Esq., for Jaques's Iris, Puxley's Prince Albert, Seedling, Snook's Defiance, Cartwright's Rainbow, Dalton's Lancashire Lass, Holmes's Count Paulina, Brook's Flora's Garland, Grey's Mary, Willmer's Amato, Hero of Middlesex, and Conquering Hero, Seedling, Mansley's Beauty of Woodhouse, Wilson's George IV., Squire's Defiance, Soorn's Bloomsbury, Hogg's Colonel of the Blues, Wood's William IV., Maud's Rauston, Ely's Leviathan, Hale's Prince Albert, Barnard's Duke of Roxburgh, and Seedling. In the Nurserymen's Class the *Large Silver* was given to the Messrs. Norman, of Woolwich, for Squire's Defiance, Ely's Lady Ely, Regulus, and John Wright, Shenning's Duke of Cumberland, Willmer's Solander, Defiance, and Conquering Hero, Wilson's Harriet, Martin's Splendid, Hale's Prince Albert, Franklin's Queen of Hearts, Calcot's Juba, Milwood's Premier, and Robert Burns, Bucknell's Ulysses, Count Paulina, Lady Gardener, Cartwright's Rainbow, Beauty of Woodhouse, Strong's Duke of York, Brook's Flora's Garland, Ely's Duke of Bedford, Hugo Meynell.—To Mr. Willmer, of Sunbury, the *Silver Knightian*, for Ely's Jolly Dragoon, Lady Ely, Addenbrook's Lydia, Willmer's Telemachus, Endymion, Solander, Prince of Wales, Duke of York, Conquering Hero, and Hero of Middlesex, Fletcher's Duchess of Devonshire, Cartwright's Rainbow, Jones's Ringleader, Appleby's Prince of Wales, Strong's Duke of York, Mansley's Beauty of Woodhouse, Twitchett's Don John, Pond's Lady of the Lake, Brooks's Flora's Garland, Christian's Excellent, Holmes's Count Paulina, Hogg's Colonel of the Blues, Ashworth's Miss Walker.—*The Silver Banksian*, to Mr. H. Ward, Woolwich, for Hale's Prince Albert, Ward's Sir Geo. Hoste, Calcot's Brutus, Holmes's Count Paulina, Giddens' Sir R. Peel, Puxley's Prince Albert and Queen, Addenbrook's Lydia, Milwood's Premier, Jacques's Iris, Mansley's Euclid, Martin's Splendid, Wilson's Harriet, Strong's Esther, Smith's Mrs. Betts, Hogg's Epaminondas, Dalton's Lancashire Lass, Brooks's Flora's Garland, Lascelles's Queen of Sheba, Rainforth's Gameboy, Irons's Ringleader, Nix's Lady Chetwynde, Bearless, Sir G. Osborne, Willmer's Miss Browning.—*Certificate*, to Mr. Willmer, Jun., King's Road, for Parker's Queen of England, Snooks's Defiance, Stone's Venus, Hale's Prince Albert, Willmer's Duchess of Kent, Endymion, Marquess of Anglesey, No. 106, and Solander, Wood's William IV., Creswell's Premier, Holmes's Count Paulina, Bates's Wellington,

Greasley's Mary Ann, Fletcher's Duchess of Devonshire, Tally-ho, Elliot's Duke of Sutherland, Hodges's Phœbus, Wilson's Harriet, Parker's Sophia, Marquess of Granby, Nutford Hero, Hoyle's Lovely Nancy, and Ely's Colonel Wainman.—*The same* to Mr. W. Catleugh, for Cartwright's Rainbow, Headley's Defiance, Puxley's Adelaide, Puxley's Gem, seedlings 194, 288, 172, 196, 189, 251, Puxley's Lady Peel, Prince of Wales, Princess Royal, and Prince Albert, Wiff's Beauty, Lodge's True Briton, Hogg's Lady Rowley, Low's Marquess of Westminster, Jacques's Iris, Hale's Prince Albert, Twitchett's Don John, Catleugh's Lady Broughton, Wakefield's Paul Pry, Strong's Duke of Bedford.

SEEDLINGS.—*Certificates* were awarded to the following Seedlings:—To Mr. Gaines for a seedling Pelargonium named *Duchess of Leinster*, a clear, bright flower, orange-pink under petals, with a dash of scarlet in the top petals; it opens well and flowers freely—Mr. Kendall for a seedling Fuchsia named *Erecta elegans*, a well-formed variety, bright carmine tube and sepals, and purple corolla—Mr. Willmer, of Sunbury, for a purple Flake named *Mayo*, a flower of good properties; and Mr. Norman, of Woolwich, for a purple Picotee named *Beauty*, a light-edged purple, well-formed, with the colour uniform and unbroken.

COUNTRY SHOWS.

Ayrshire Horticultural Society, June 25.—This was the first Exhibition. The display of flowers was excellent, the Pelargoniums, Calceolarias, and Fuchsias were beautiful, and constituted the greater part of the Exhibition. The Heaths, a class of flowers becoming every year more popular, from Mrs. Hamilton and J. Miller, Esq., were very fine. Among Greenhouse Plants, we observed a specimen of Pimelea decussata, from the garden of Mrs. M'Taggart; it measured 4 feet in height and about 9 feet in circumference, and was covered from top to bottom with flowers. Among Herbaceous Plants was a fine Pentstemon cobœa, from the gardens of M. Hamilton, Esq. *Greenhouse Plants*: Mr. Hunter, for Pimelea decussata, Gesnera reflexa, Erythrina Crista galli, Erica vestita alba, and E. breviflora. *Pelargoniums*: Mr. Hunter, for Witch, Decorum, and a Seedling. *Best* 7, Mr. Hunter, for a Seedling called Medona, Rienzi, Priory Queen, Lord Mayor, Evandine, and Victory. *Herbaceous Plants*: Mr. Naismith, for Pentstemon cobœa, and a Lilac Rocket. *Best* 13, Mr. Hunter, for Cypripedium spectabile, Cypripedium pubescens, Dodecatheon media elegans, D. media alba, Campanula grandis, Gladiolus byzantinus, Lupinus polyphyllus, &c. *Pansies*: Mr. Naismith, for Ayrshire Lass, Waverley, Lord Montgomery, Eclipse, Diana Vernon, Criterion, Daniel De Foe, Flora M'Donald, Complete, Ivanhoe, Queen Victoria, Miss Chalmers, and Angelica. *Cinerarias*: Mr. Naismith, for Grandis, Incomparable, and Royal Blue. *Fuchsias*: Mr. Hunter, for Venus Victrix, Monypenni, and Fulgens magniflora. *Heaths*: Mr. Hunter, for five varieties of Ventricosa. Among extra articles were a collection of Azaleas and American plants, from Mr. Smith, Monkwood Grove. A beautiful display of Cacti, Azaleas, and a good Statice arborea, from Roselle. Four stalks of Myatt's Victoria Rhubarb, weighing 3lbs. each, from the Nursery of T. Imrie and Sons. Acacia pulchella, Achimenes longiflora, Erica superba, Boronia pinnata, and a few fine Calceolarias, from Mr. M. Hamilton. Medals were awarded to Mr. Naismith, for Pimelea spectabilis, and P. decussata; to Mr. Kirkland for Tropæolum tricolorum; to Mr. Hunter for Fuchsia Lanei; to Mr. Naismith for Fuchsia fulgens multiflora; to Mr. Hunter for Fuchsia globosa splendida; and to Mr. Pollock for Ayrshire Lass Pelargonium.—*Ayrshire Agriculturist.*

Bebington Horticultural Society, June 5.—This was the first meeting for the season. The specimens most worthy of notice were a beautiful Cactus speciosissimus, from S. Needham, Esq., the Rev. Mr. Mainwaring's Euphorbia splendens, Sir W. Stanley's Oncidium flexuosum and Azalea indica. There were a great number of choice Pelargoniums, amongst which, Joan d'Arc and Beauty of Ware, from H. Littledale, Esq., were much admired. The Fruits generally were good, consisting of Black and White Grapes, Melons, and Cherries. The following Prizes were awarded:—*Orchidaceous Plant*: Oncidium flexuosum, Sir W. M. Stanley, Bart. *Stove Plant*: Euphorbia splendens, Rev. J. Mainwaring. *Greenhouse Plant*: Azalea indica, Sir W. Stanley. *Pelargonium*: Joan d'Arc, H. Littledale, Esq. *Fuchsias*: Globosa maxima, G. J. Wainwright, Esq. *Collection of Greenhouse Plants*: 1, Salvia patens, Statice arborea, Lychnis fulgens, Erica prægnans, and E. tricolor elegans, Sir W. Stanley; 2, Gloxinia maxima, Achimenes longiflora, Martynia fragrans, Boronia serrulata, &c., Rev. J. Mainwaring. *Pelargoniums*: 1, Coronation, Bridesmaid, Vulcan, Lady Douro, Orange Boven, Queen Dowager, H. Littledale, Esq; 2, Sylph, Louis Quatorze, Cerito, Alexandrina, Corinne, Joan d'Arc, H. Winch, Esq. *Four Ditto*: 1, Juba, Coronation, Erectum, and Mabel, Sir W. Stanley; 2, Decorum, Beauty of Ware, Barratt's British Queen, Grand Duke, H. Littledale, Esq. *Fuchsias*: 1, tricolor, Victoria, Monypennii, Curtisii, Enchantress, and fulgens, Sir W. Stanley; 2, Venus Victrix, Britannia, Enchantress, Chandlerii, and magnifica, J. T. Raynes, Esq. *Verbenas*: 1, Queen, Perfection, Hendersonii, rosea odorata, variegata, and speciosa, H. Winch, Esq.; 2, Ignea, Rubens, Pulchra, Hislopii, and Invincible, P. Quirk, Esq. Best *Greenhouse Plant*: Aphelexis humilis, Sir W. Stanley. Best *Stove Plant*: Gesnera Cooperii, W. Sharp, Esq.—*Liverpool Mail.*

Blackburn Tulip Show, June 19.—At a Meeting of the Tulip-growers of Blackburn and its neighbourhood, the following flowers obtained Prizes:—*1st Pan of Six Blooms*, containing Trafalgar, Phœnix, La belle Narinne, Lewold, La belle Annette, and Unique, Mr. T. Chippindale; 2, Trafalgar, Incomparable Bizarre, Violet Winner, Violet à fond Noir, Duc de Bronté, and Unique, Mr. N. Briggs. *Three Blooms*: 1, Duke of Lancaster, Bien Fait, and Walworth, Mr. E. Hodgson; 2, Duke of Wellington, Violet Winner, and Heroine, Mr. T. Chippindale. *Breeders, two in each Class*: 1, Arlette, Mr. J. Houlker; 2, Lady Crewe, Mr. W. Hargreaves—1, Sancta Sophia, Mr. T. Chippindale; 2, Saint Sebastian, Mr. R. Kemp—1, Duke of Hamilton, Mr. J. Houlker; 2, Charbonier, Mr. J. Houlker. *Selfs*: 1, Min d' Or, Mr. N. Briggs; 2, White Flag, Mr. N. Briggs. *Doubles*: 1, Double Buer, Mr. N. Briggs. *Premier Bloom*: Washington, Mr. R. Kemp. *First Class*: Trafalgar, Mr. N. Briggs; Farren's Liberty, Mr. J. Houlker; Duke of Wellington, Mr. C. Turner; Duke of Lancaster, Mr. T. Chippindale; Surpass Catafalque, Mr. E. Hodgson; Catafalque Superieure, Mr. H. Seed; Sir Sydney Smith, Mr. R. Kemp. *Second Class*: Violet Winner, Mr. T. Chippindale; Washington, Mr. W. Hargreaves; Mungo, Mr. R. Riding; Maître partout, Mr. J. Houlker; Demeroc, Mr. R. Kemp; Laura, Mr. N. Briggs; Ne plus Ultra, Mr. T. Chippindale. *Third Class*: Wallworth, Mr. E. Hodgson; Do-little, Mr. W. Wilkinson; Lady Crewe, Mr. J. Houlker; Prince Albert, Mr. R. Riding; Rose Carneuse, Mr. T. Chippindale; Rose Celina, Mr. R. Riding; Heroine, Mr. E. Hodgson. *Fourth Class*: Abercromby, Mr. J. Houlker; Incomparable Bizarre, Mr. W. Hargreaves; Phœnix and Lustre de Beauté, Mr. E. Hodgson; Albion, Mr. H. Seed; Turner's Black Prince, Mr. N. Briggs; Beauté Frappante, Mr. E. Hodgson. *Fifth Class*: Unknown, Mr. E. Hodgson; Roi de Siam, Bien Fait, and Violet Wallers, Mr. R. Ainsworth; Maître partout, Mr. W. Hargreaves; Prince de Largess, Mr. R. Ainsworth; Fudler, Mr. C. Turner. *Sixth Class*: Rose Unique and Rose Vesta, Mr. W. Wilkinson; Lady Crewe, Mr. T. Chippindale; Roi de Cerise, Mr. R. Ainsworth; Triomphe Royale, Mr. E. Hodgson; La Vandyke, Mr. W. Wilkinson; Lord Hill, Mr. N. Briggs.

Cambridge Florists' Society, June 20.—Roses were present in great variety. Ranunculuses were not so fine as we have seen them. Pansies were of good size and first-rate shape. The following Prizes were awarded:—*Ranunculuses.*—White ground Spotted: Prince of Wales, Mr. Crisp; Mason's Nova, Mr. Ready; Maid Marian, Mr. R. Headly; Esther, La Tendresse, and Esther, Mr. Catling. Dark Purple: Variâtre, Mr. Crisp; Superbus, Mr. Ready; Variâtre, Mr. Catling; Bishop Von Lima, Superbus and Variâtre, Mr. Ready. Yellow ground Spotted: Andromache, Mr. Crisp; Andromache, Mr. Ready; Pucella, Mr. R. Headly; L'Arbrisseau, Mr. Catling; Grand Monarque and Andromache, Mr. Ready. Rose and Pink: Ajax, Rose Unique, Alphonso, Duchess of Richmond, Alphonso and Rose Unique, Mr. Catling. White Edged: Maid Marian, Madeline, and La Singulaire, Mr. R. Headly; Dorcas, Mr. Ready; Mr. Welch, Mr. R. Headly; La Singulaire, Mr. Catling. Light Purple and Grey: Nomius, Mr. Crisp; Porcis, Amstamus, Othello, Baroness Percy, and Nomius, Mr. Ready. Orange: Cedo Nulli, Orange Brabançon, Prince of Orange, and Orangiere, Mr. Crisp; Black: Condorcet, Naxara, and Condorcet, Mr. Catling; Black Prince, Naxara, and Kempenfeldt, Mr. R. Headly. Buff: Cox's Buff, Fair Quaker, Coleure de Perle, and Cox's Buff, Mr. Crisp; Red and White Striped: Le Temeraire, Œillet Parfaite, Le Temeraire, and Œillet Due, Mr. Crisp. Olive: Bouquet Sanspareil, Pherobasis, Harvey's Olive. Jaune en Pompadour, Bouquet Sanspareil, and Hortensis, Mr. Crisp. White: La Favorite, Mr. Crisp; Pausanias, Mr. R. Headly; White Swan, Snowden, Februa, and Pausanias, Mr. Ready. Yellow ground Edged: Headly's King James, Albion, Nestor, Marshal Ney, and Pucello, Mr. R. Headly. Crimson: Duke of Wellington, and Pucello, Mr. R. Headly. Crimson: Duke of Wellington, Mr. Catling; Firebrand, Newton, Manlius, and Firebrand, Mr. Catling; Firebrand, Newton, Manlius, and Firebrand, Mr. Crisp; Duke of Wellington, Mr. Catling. Yellow and Sulphur: Adrian, Mr. Crisp; Eliza and Beroth, Mr. Ready; Sulphurea, Mr. R. Headly; Ghisee, Mr. Crisp; Marquisate, Mr. Ready. Scarlet: Jupiter, Alphonso, and Rising Sun, Mr. R. Headly; Jupiter, Mr. Ready; Rising Sun, and Julius Cæsar, Mr. R. Headly. Coffee Colour: Prince George, and Theodat, Mr. Crisp; Versaillois, Mr. Catling; Pherobasis, Mr. Ready; Prince George, Mr. Catling; Theodat, Mr. Ready. Red and Yellow Striped: Scarlet and Gold, Mélange des Beauté, La Soleil, Scarlet and Gold, and Mélange des Beauté, Mr. Crisp. Shaded White: Princess Charlotte, Tillott's Blush, St. Jerome, Tillott's Blush, and St. Jerome, Mr. Crisp. Mottled: Thompson's Queen, Mr. Catling; Seedling, Shell, and Seedling, Mr. R. Headly; Julienne, Mr. Crisp. *Pinks.*—Red lace: Buck's Queen, Mr. Ready; do., Mr. R. Headly; Mrs. Childers and Earl of Uxbridge, Mr. J. Headland; Bond's Seedling, Mr. Ready; Mrs. Childers, Mr. J. Headland. Purple Laced: Duke of Northumberland, Mr. J. Headland; Norman's Henry and Hodges's Gem, Mr. R. Headly; Lovely Ann, Mr. Ready; Hodges's Gem and Duke of Northumberland, Mr. J. Headland. Rose Pinks: Wood's Superb and Windsor Castle, Mr. Catling; Wood's Superb, Mr. R. Haylock; Harefield Rose and Anna Boleyn, Mr. Catling; Wood's Superb, Mr. R. Haylock. Plain Pink: Conqueror, Mr. J. Headland; Venus, Parry's Union, Well's Superb, Conqueror, and Parry's Union, Mr. Catling. *Roses.*—Crimson: Boule de Nanteuil, Mr. J. Sparrow; Guerin's Gift, Mr. H. Green; George the Fourth, Messrs. Hudson; Edmund Kean and Grande Cramoise, Mr. Twitchett. Yellow: China Ne Plus Ultra and Smith's Yellow Noisette, Mr. H. Green; do., Mr. E. Harris; do., Mr. H. Green; do., Mr. J. Sparrow. Deep Blush: Claude Duval, Mr. Catling; Browne's Superb, Mr. H. Greene; Provence, Mr. Ready; Crested Moss and Provence Moss, Mr. R. Headly. Striped: Village Maid, Mr. Ready. Light Blush: Triomphe de Guerin, Mr. H. Greene; do., Mr. Twitchett; do., Mr. J. Headland; Fanny Parrisot and Maiden's Blush, Mr. Twitchett. Dark: Miralba and General Lamarque, Mr. H. Green; Thornless Violet, Mr. F. B. Smith; Grand Duke of Tuscany, Messrs. Hudson; do., Mr. E. Harris. White: Blanche Fleur, Mr. J. Sparrow; do., Mr. H. Green; Madame Hardy, Mr. Twitchett; Unique, Mr. J. Edis; Madame Hardy, Mr. J. Sparrow; do., Mr. E. Harris. Crimson Scarlet: Brennus, Mr. H. Greene; do., Mr. J. Headland. Mr. H. Green's Prize to *Amateurs.—Pan of Roses*: 1, Blanche Fleur, Village Maid, Fanny Parrisot, George IV., Triomphe de Guerin, Provence, China Ne Plus Ultra, Fulgens, and Brennus, Mr. J. Sparrow; 2, Yellow Noisette, Blanche Fleur, Provence, Coronation, George IV., Duke of Devonshire, Beauty of Billiard, Duchess d'Angoulême, and Brennus, Mr. J. Taylor. *Pan of Six*: 1, Duke of Devonshire, Crested Moss, Madame Hardy, Edmund Kean, Brennus, and Triomphe de Guerin, Mr. Twitchett; 2, Madame Hardy, George IV., Blanche Fleur, Ne Plus Ultra, Provence, and Duke of Devonshire, Mr. E. Harris. *Pan of Three*: Duke of Devonshire, Provence, and Blanche Fleur, Mr. J. Boning. *Collections of Plants*: 1, Erica mutabilis, Ventricosa superba, and jasminiflora, Spiræa japonica, Petunia superba, Pelargonium tricolor, Vinca rosea, and picta, Oncidium pulvinatum, and flexuosum, Gloxinia speciosa, and rubra, Pimelea decussata, Lantana Sellowii, Sedum cæruleum, Swainsona coronilliafolia, Mr. A. Biggs; 2, Pentstemon gentianoides, Petunia, Enchantress, Hydrangea hortensis, Fuchsia fulgens, and multiflora, Clematis florida, Erica ventricosa superba, Pelargonium, Victory, and Garth's King, Rhododendron ponticum, Verbena Thompsonii, Pimelea decussata, Lotus Jacobæus, Azalea odorata, Alstrœmeria pelegrina, Leschenaultia biloba, and formosa, Mr. H. Green. *Specimen Plant*: 1, Fuchsia globosa, Mr. A. Biggs; 2, Clematis Sieboldi, Messrs. Hudson. EXTRA PRIZES: Alstrœmeria pulchella, Mr. Ready.—*Cambridge Chronicle.*

Cambridgeshire Horticultural Society, June 19.—This Exhibition, like the preceding, was well attended. The following prizes were awarded:—*Strawberries*, 1, Keen's Seedling, Mr. G. Fisher; 2, do., Mr. Cumming. *Melon*, Green Persian, Mrs. R. Foster. *Roses*, 2, Mr. Gimson, for Madame Dubarry, Village Maid, fulgens, Blush Hip, Wellington, George the Fourth, Ville de Bruxelles, Duchesse d'Angoulême, Margined Hip, Las Casas, Duc de Cayes, Blush Moss, Luxembourg Moss, African Black, White Moss, Tuscany, Madame Hardy, grandissima, La Volupte, Blanchefleur, Boula de Nanteuil, Perpetual, Antinous, and Brown's Superb; 3, Mr. Green, for Globe Hip, Madame Dubarry, Euphrosyne, Camien carnea, Amelia d'Abancourt, Kean, Nalba, Leo the Tenth, Cyrus, Blanchefleur, Royal Marbled, Brennus, Crested Moss, splendidissima, Marbled Superb, Madame Hardy, Brown's Superb, Duke of Devonshire, Beauty of Billard, Coronation, Ne plus Ultra, fulgens, Antonius; 4, Mr. Green, for Provins Moss, Blanchefleur, Queen of Bourbons, Nelly, Crimson Moss, Kean, Prince Albert, Coronation, Madame Desprez, General Lamarque, Luxembourg Moss, Unique, Miss Chauncy, Bernard, Virgin Rose, Grand Triumphant, Duke of Devonshire, fulgens, Crested Moss, Cyrus, Fulgorie, Fanny Parissot, and Wellington; 3 *varieties*, Mr. Twitchett, for Madame Hardy, Brennus, and Village Maid. *Plants in pots*, 2, Mr. Green, for Hydrangea hortensis, Pelargonium Victory, do. Gaines's King, Pentstemon gentianoides coccineum, Alstrœmeria pelegrina, Petunia Enchantress, Petunia Seedling, Petunia Sir Robert Peel, Fuchsia Chandlerii, do. carnea, Azalea odorata, Clematis florida, Erica ventricosa superba, ventricosa, Hartnelli bicolor, Rhododendron ponticum, Lotus Jacobæus, Pimelea decussata, Verbena Thompsonia, and 2 Balsams; 2, Messrs. Hudson, for Clematis Sieboldii, Cactus speciosus, Scotii, and Jenkinsonii, Fuchsia Thompsonia, Calceolaria bicolor, Verbena Queen, Pelargonium Mrs. Maclean, Orange Boven, effulgens, and Sollya heterophylla. *Single Specimen*, 2, Mr. Widnall, for Clematis Sieboldii; Messrs. Hudson, for Cactus speciosissimus. *Fuchsias*, 6 *varieties*, 1, Mr. Widnall, for Eppsii, elegans, nobilissima, Frostii, formosa elegans, multiflora; 2, Mr. Green, for fulgens, Curtisii, rosea, elegans, bicolor, Youelli, and elegans superba. *Amateurs*, 2, Messrs. Hudson, for Curtisii, globosa-major, and Chandlerii. EXTRA PRIZES—*Roses*, Mr. Ready, for Ne plus Ultra, fulgens, Brennus, Provence, Unique, Moss, Madame de Frisby, Tuscany, Burning Coal, George the Fourth, Village Maid, and Unknown. *Pæonies*, Mr. Gimson, for Rawesii, Humei, odorata, and alba.—*Cambridge Advertiser.*

Chichester Horticultural Society, June 15.—This was the first meeting for this year. It was held in the grounds belonging to the Diocesan College, which are beautifully wooded with Acacias and other rare trees. Several prizes were awarded, but we have only been furnished with a list of rewards without the names of the flowers for which they were given.

Royal Cornwall Horticultural Society, July 9.—This was the second Exhibition. The show of flowers was not equal to that of the previous meeting. Among stove plants were Cattleya, Morrisonii, and Oncidium flexuosum; several specimens of Achimenes and Rondeletia speciosa. Messrs. Veitch, of Exeter, showed—Hindsia violacea, H. longiflora, Clitoria fulgens, Echites atropurpurea, and Pentas carnea. FRUIT.—The prizes were awarded as follow:—*Melon*: 1, King's Own Green Flesh, G. C. Fox, Esq.; 2, W. Daubuz, Esq., for the same. *Cherries*: 1, Black Heart, J. Vivian, Esq.; 2, White Heart, Mrs. Sampson. *Gooseberries*: Yellow Rockwood, Mrs. Sampson; green or white *Do.*: Wainwright's Green Cream, Mrs. Sampson; *Do.*: red, Wellington, Mrs. Sampson. *Currants*: Knight's Red, Sir C. Lemon, Bart., M.P.; *black Do.*: Naples Black, Sir C. Lomon, Bart., M.P. *Red Raspberries*: Caroline, Mrs. Sampson. *Strawberries*: 1, Old Pine, Sir C. Lemon, Bart., M.P.; *Do.*, 2, Carolina, Rev. C. Rogers. *Cherries*: May Duke, Rev. C. Rogers. *Melon*: King's Own, Rev. C. Rogers. FLOWERS.—*Stove Plants*: 1, Achimenes longiflora, A. grandiflora, Ardisia crenulata, Rondeletia speciosa, Vinca rosea, Ixora bandhuca, J. P. Magor, Esq.; 2, Euphorbia splendens, Achimenes grandiflora, Vinca oculata, Manettia cordata, Achimenes longiflora, Vinca oculata rosea, J. Vivian, Esq.; 3, Achimenes longiflora, A. grandiflora, Rondeletia speciosa, Clerodendron splendens, Manettia glabra, W. M. Tweedy, Esq. *Orchidaceous Plants*: 1, Oncidium papilio, J. P. Magor, Esq.; 2, Cattleya Harrisonii, G. C. Fox, Esq. *Greenhouse Plants*: Lychnis grandiflora, Sollya salicifolia, Petunia rook's nest, Miller's punctata, Statice puberula, Viscaria oculata, G. N. Simmons, Esq.; specimen, Hoya carnosa, J. P. Magor, Esq. *Pelargoniums*: Le Grand, Nansilgans, Anna, Atillabey, Ignez do Castro, W. Daubuz, Esq. *Heaths*: Eximia, viridiflora, ventricosa prægnans, and ventricosa superba, G. N. Simmons, Esq. *Fuchsias*: 1, Tricolor, Augusta, Exoniensis, Grovehilli, Richardii grandiflora, Multiflora, J. Vivian, Esq.; 2, Batesii, Magnifica, Exoniensis, Tricolor, Victoria, Splendidissima, G. C. Fox, Esq.; 3, Augusta, Curtisii, Middletonia, Richardii grandiflora, Monypennii, Majestica multiflora, F. Passingham, Esq. *Verbenas*: 1, Ovid, Tweedeana superba, Laconii, Queen, Esq. *Verbenas*: 1, Ovid, Tweedeana superba, Laconii, Queen, Ignea, Odoratissima, Rev. C. Rogers; 2, Queen of Orange, Odoratissima, Bride, Davisonii, Duke of Cornwall, Seedling, G. N. Simmons, Esq. *Roses*: 1, Smith's Yellow, Fulgens, Jaune Desprez, Hybrid Lamarque, Devoniensis, Indica carnescens, Anna Maria, Garlandia, Yellow China, King, Goliah, Tea Beaugere, G. C. Fox, Esq.; 2, Jaune Desprez, Hybrid China, Clara Sylvain, Astrolabe, Common Moss, Smith's Yellow, Celina Moss, Acidalie, Unique provins, River's Perpetual, L'Ingenue, Duc de Choiseul, N. C. Stephens, Esq. *Carnations*: Wood's William IV., Wigg's Earl of Leicester, Ely's Lady Ely, Ely's Col. Wainman, Jaques gloriana, Mansley's Beauty of Woodhouse, F. Passingham, Esq. *Picotees*: Sharp's Hector, Martin's Queen Victoria, Purple Perfection, Burough's Miss Jane, Syke's Eliza, Sharp's Cleopatra, F. Passingham, Esq. *Fuchsias*: Pulcherrima, Augusta, Venus Victrix, St. Clare, Dalstonii, Cornubiensis, G. N. Simmons, Esq. *Picotees*: Syke's Eliza, Ely's Bright Venus, Sharp's Duke of Wellington, Cox's Clarence, Garrett's Lady Dacre, Wilmer's Mary Anne, Mr. R. Dunn. *Calceolarias*: Indescribable, Decora, Brilliant, Splendens, Gem, Bicolor, W. Daubuz, Esq. *Petunias*: Splendens, Grandiflora, Madonna, Rosea alba, Lady Peel, Gem, F. Passingham, Esq. VEGETABLES.—*Peas*: 1, British Queen, W. Daubuz, Esq.; 2, Woodford Marrow, G. C. Fox, Esq. *Kidney Beans*: G. C. Fox, Esq. *Cauliflowers*: Walcheren, F. Passingham, Esq. *Artichokes*: Globe, Sir C. Lemon, Bart., M.P. FLORISTS, NURSERYMEN, AND MARKET GARDENERS.—*Roses*: 1, cut flowers, River's Clustered, Barbed, Moss Vibren, Isle de Bourbon, Madame Laffay, White China, Perpetual China, Yellow China, Tricolor pompone, Common Moss, Noisette China, Black odorata, Madame Dubarry, Lord Wellington, Common China, River's Nankin, New Blush Moss, Duchess d'Angoulême, Blush New Brunswick, Amy Robsart, Cyntie, Aimee Vibert, and Blushing Maid, Mr. J. Treseder; 2, Royal Portugal, Duchess d'Angoulême, Grand Agatha, St. Peru, Queen Bourbon, Tuscany, Aimee Vibert, Damask, Triomphe de Flore, Charles X., Ne plus Ultra, General Lamarque, De la Flesh Moss, White Moss, Wellington, Blush Moss, Unique, Fimbriata, Village Maid, Fulgens, Caroline, Black African, Luxembourg Moss, Hybrid Bourbon, and Lacepede, Mr. J. Paul.—*From the West Briton, Cornwall.*

Doncaster Horticultural Society, June 26.—This was the second Exhibition. The plants and flowers were much inferior to those of the previous meeting. Dr. Scholfield exhibited a fine specimen Sedum acre. Among the nurserymen, Mr. W. Barratt, of Wakefield, sent Lilium speciosum; and from Mr. Milan were several varieties of Achimenes. W. Chadwick, Esq., exhibited a beautiful Thunbergia alata. From Mr. Cooke was Erythrina crista-galli, which obtained the first Prize. The following Prizes were awarded:—*Stove Plant*: G. J. Horsfall, Esq., Gloxinia rubra and speciosa. *Greenhouse Plant*: 1, H. Cooke, Esq., Erythrina crista-galli; 2, G. J. Horsfall, Esq., Achimenes longiflora; 3, W. Chadwick, Esq., Crassula coccinea. *Cactus*: 1, G. C. Walker, Esq., Cactus Ackermanni; 2, G. J. Horsfall, Esq., Cactus speciosissimus. *Exotic Climber*: 1, W. Chadwick, Esq., Thunbergia alata; 2, G. C. Walker, Esq., Clematis Sieboldii. *Purple Pelargonium*: Dr. Scholfield, Juba and Conservative. *Crimson*: Dr. Scholfield, Splendidum and Grand Duke. *Rose*: 1, Dr. Scholfield, Helen of Troy; 2, W. Chadwick, Esq., Priam. *Pink*: Dr. Scholfield, Nymph. *Blush*: 1, W. Chadwick, Esq., Victory; 2, Lady Cooke, Rienzi. *Light-clouded*: 1, Dr. Scholfield, Jehu; 2, Lady Cooke, St. Leger. *Dark-clouded*: 1, H. Cooke, Esq., Firebrand; 2, Dr. Scholfield, Jewess. *Scarlet*: Lady Cooke, Superb. *Striped*: Dr. Scholfield, Speculum mundi. *White*: Lady Cooke, Alexandrina. *Erica*: H. Cooke, Esq., Ventricosa superba. *Fuchsia*: 1, Mrs. White, Exoniensis; 2, Dr. Scholfield, Devonia. *Cineraria*: Dr. Scholfield, Wizard of the North. *Herbaceous Plant*: Dr. Scholfield, Phlox omniflora. *Pansies*: G. Jessett, Esq., Margery Dawson, Beauty of Hitching, Yellow Defiance, Governess, Anna, Black Prince, Sulphurea elegans, Lord Francis Egerton, Sunbeam, Cox's Defiance, and Napoleon. *Six varieties*: G. Jessett, Esq., Regulator, Prince Albert, Lord F. Egerton, Maid of Milan, Fiddy, and Yellow Defiance. NURSERYMEN'S PRIZES.—*Greenhouse Plant*: Mr. Milan, Achimenes grandiflora. *Exotic Climber*: Mr. Milan, Morinda alba.—*Doncaster Gazette.*

Hampstead Florist Society, June 13.—This was the first Exhibition; it took place in the grounds of J. Jackson, Esq. The company was numerous. The following Prizes were awarded:—*Collections*: 1, Mr. Cockburn, gr. to the Earl of Mansfield, for Pimelea decussata, Philibertia grandiflora, Tropæolum tricolorum, Epacris grandiflora, Anagallis grandiflora rubra, Swainsona albiflora, Cytisus spicatus, Leschenaultia formosa and biloba; 2, Mr. Calver, gr. to J. C. Melville, Esq., for Cactus grandiflorus, Polygala cordifolia, Fuchsia Monypennii and racemiflora; a Petunia, named Beauty; a Brugmansia, Loasa grandiflora; a Calceolaria, named Gem; Mimulus roseus,

and others. 6 *Plants*: 1, Mr. Goulding, gr. to T. Turner, Esq., for Pimelea decussata, Tropæolum pentaphyllum, Epacris grandiflora, Cactus Jenkinsonii and Ackermannii, and a Calceolaria, called Emperor; 2, Mr. Wren, gr. to T. Neville, Esq., for Cactus Jenkinsonii, speciosissimus, and Ackermanni, Pimelea decussata, Erica ventricosa, and Polygala cordifolia; 3, Mr. Garrod, gr. to R. B. Forman, Esq., for Cactus speciosus, Ackermanni, Erica ventricosa superba, together with Gloxinia maxima, and caulescens; 4, Mr. Tucker, gr. to A. Crofton, Esq., for Pimelea hispida and rosea, Mimulus roseus, Fuchsia Atkinsonii and corymbiflora, and a seedling Polygala. *Specimen Plant*: 1, Mr. Goulding, for Pimelea decussata; 2, Mr. Cockburn, for Cactus speciosus; 3, Mr. Wren, for Æschynanthus parasiticus; 4, Mr. Tucker, for Fuchsia globosa major; 5, Mr. Garrod, for Polygala grandiflora. *Pelargoniums*: 1, Mr. Goulding, for Joan of Arc, Beauty of Hampstead, Sylph, Beauty of Ware, Rienzi, Jewess, Louis Quatorze, Victory, and a seedling; 2, Mr. Cockburn, for Bianca, Erectum, Pearl, Harmony, Enchantress, Comte de Paris, Victory, Elizabeth, and Novelty; 3, Mr. Garrod, for Climax, Victory, Lady Denbigh, Enchantress, Priory Queen, Joan of Arc, Sir Robert Bruce, Comte de Paris, and Rienzi. 6 *Varieties*: 1, Mr. Crookshank, gr. to J. Jackson, Esq., for Gauntlet, Pearl, Florane, Una, Bridesmaid, and Madona; 2, Mr. Wren, for Enchantress, Victory, Sylph, Grand Duke, Alicia, Superba; 3, Mr. Calver, Beauty of Hampstead, Lady Denbigh, Lady Murray, Mr. Stewart, Victory and Priory Queen; 4, Mr. Tucker, Lady Denbigh, Garth's Perfection, Belladonna, Erectum, Jewess, and a seedling. *Calceolarias*: 1, Mr. Garrod, for Royal Standard, Lady of the Lake, Green's Victoria, Barnes' King, Thomson's Corymbiflora, and Sir Robert Sale; 2, Mr. Cockburn, for Lady Constable, Royal Standard, Barnes' King, Standishii, and two others.

Inverness Horticultural Society, June 20.—The numerous advantages of devoting attention, in the first place, to the higher branches of Horticulture, observed by this Society, are now beginning to develop themselves, with much satisfaction to the acting committee, and great benefit to our northern districts. Many thought that the founders offering prizes at the commencement for the very finest greenhouse productions, which are the subjects of competition at the English Shows, was but a foolish imitation of southern practices, and exclaimed that we should be content with mere common garden flowers and vegetables, and should chiefly devote ourselves to the improvement of small amateur and cottage gardens. Amateurs were early encouraged to compete, but it is only now that they are beginning to do so; and for the last three successive years the premiums offered to cottagers have been utterly disregarded, no one being found prepared, either in their premises or gardens, to stand the test of examination. Perfection is only attained by aiming at a high standard, and therefore our northern horticulturists were quite right in attempting the best things, and holding out rewards for the finest and newest productions, excepting such only as require stove heat. The consequence has been a very marked and progressive improvement in the character of one and all of our recent Exhibitions in Inverness, and the gradual elevation of the whole horticulture of the north to a respectable position. Gardening, even on the smallest scale and in the remotest parts of the Highlands, is not now what it was in the days of our fathers: the rearing only of a few Snow-drops, Pæonies, Monkshood, and Bachelors' buttons, and of "Kale, Saffron, and pot herbs." This Exhibition was an excellent one, and was graced by the attendance of a numerous and respectable class of visitors. A decided improvement was visible in the mode of culture among all the growers, and several new things were exhibited. The following premiums were awarded: *Pelargoniums.*—1, Mr. W. Dallas, gr., Raigmore House, for Life Guardsman, Sylph, Nymph, Bridegroom, Rosetta, and Annetta; 2, Mr. J. Stephen, gr. to Lady Saltoun, for Sylph, Alicia superba, Comte de Paris, Gaines's King, Louis Quatorze, and Jewess. Extra prize, Mr. Dallas, for Foster's Alicia, Garth's Perfection, Alexandrina Victoria, Rienzi, Sylph, Joan of Arc, Queen of Beauty, Orange Boven, Jewess, Masterpiece, Imogene, and Duke of Devonshire. *Calceolarias.*—1, Mr. R. Fraser, gr. to E. Baillie, Esq., for seedlings unnamed; 2, Mr. R. Findlay, gr. to W. F. Tytler, Esq., for Lady Bruce, Speciosa, Superba, Magniflora, and two seedlings. *Fuchsias.*—1, Mr. R. Fraser, for F. Candidate, Colossus, Attractor, and Conductor; 2, Mr. W. Westwood, gr. to J. Stewart, Esq., for Monypennii, Standishii, Venus Victrix, and Rosea alba. Best grown Fuchsia: 1, Mr J. Ross, gr. to Lady Rose, for F. insignis; 2, Mr. Westwood, for Greyii. *Cinerarias.*—1, Mr. Westwood, for King, Rival King, Royal Blue, and Imperial Blue. *Mimulus.*—1, Mr. J. Bain, gr. to Lord Lovat; 2, Mr. Dallas, for seedlings. *Balsams.*—1, Mr. Bain; 2, Mr. Ross. *Petunias.*—1, Mr. W. Dallas; 2, Mr. Bain. *Verbenas.*—1, Mr. Ross, for the Queen, Burleyana, Buistii, Princess Royal, Prince of Wales, and Laconii; 2. Mr. J. Stephen, for Princess Royal, Prince of Wales, Tweedeana elegans, Rosea elegans, Victory, and Rosea. *Exotic Plants.*—1, Mr. Ross, for Gesnera bulbosa, Gloxinia candida, G. Priestleyii, Euphorbia splendens, Pimelea sylvestris, and Philibertia grandiflora; 2, Mr. J. Stephen, for Polygala oppositifolia, Pimelea decussata, Elichrysum proliferum, Sollya heterophylla, Beaufortia decussata, and Swainsona galegifolia. *Specimen of any Exotic.*—1, Mr. Ross, for Russelia juncea—a splendid specimen, trained on an umbrella-shaped trelis, five feet high, from the top of which it drooped downwards for four feet; 2, Mr. Stephen, for Epacris grandiflora. *Rare Exotic Plant.*—Mr. Ross, for Physolobium subumbellatum—a hardy greenhouse plant from Swan River. *Heaths.*—Mr. Stephen, for Erica ventricosa, v. prægnans, v. steilata and odorata. *Rockets.*—Mr. Westwood. *Herbaceous Plants.*—1, Mr. Ross, for a new spotted Digitalis, Spiræa Japonica, Delphinium Barlowii, D. grandiflorum, Crucianella stylosa, Dianthus caryophylloides, Stachys coccinea, Pæonia Whitleii; 2, Mr. Westwood, for Allium molle, Lychnis flos-cuculi, Dictamnus ruber, Lathyrus grandiflorus, Achillea tomentosa, Aster tomentosus, Delphinium grandiflorum, and Campanula speciosa. *Irises.*—1, Mr. Westwood; 2, Mr. Ross. *Pinks.*—1, Mr. Stephen; 2, Mr. J. Lawrence. *Pansies.*—1, Mr. Lawrence; 2, Mr. Westwood. *Double Anemones.*—1, Mr. J. Treasurer, gr., Forres; 2, Mr. Stephen. *Cut Roses.*—1, Mr. Treasurer, for Fabvier, Napoleon, Archduke Charles, and Deschiens; 2, Mr. Macdonald, gr., Newton. *Basket of Exotics.*—1, Mr. Ross, for a fine basket, containing Gloxinias, Pimeleas, Achimenes, Boronias, Cockscombs, Balsams, and Hydrangeas; 2, Mr. Stephen, for a similar basket. *Bouquet of Flowers.*—Mr. Lawrence. *Best kept Apples.*—1, Mr. J. Ross, for Ribston Pippins, and Nonpareil Russets, preserved in sand; 2, Mr. Cameron, gr. to Gen. Cameron. *Cucumbers.*—1, Mr. J. Ross, for two of Weeden's Cucumbers, 24½ inches long, by 1¾ in diameter; 2, Mr. Grant. *Unforced Cherries.*—1, Mr. Bain; 2, Mr. G. Ross, gr., Bught. *Unforced Strawberries.*—1, Mr. A. Fraser, gr. to J. Thomson, Esq., for Myatt's Pine and Ballieferrie seedling—both kinds were large and well flavoured; 2, Mr. G. Ross. *Peas.*—1, Mr. J. Ross, for Early Charlton; 2, Mr. Bain. *Cauliflower.*—1, Mr. Mackintosh, gr. to J. Mackenzie, Esq.; 2, Mr. W. Mackenzie, gr. to Sir J. J. R. Mackenzie. *Turnips.*—1, Mr. J. Stephen; 2, Mr. Dallas. *Potatoes.*—1, Mr. R. Fraser; 2, Mr. W. Mackenzie. *Cabbages.*—1, Mr. Ross, for large York; 2, Mr. Fraser. *Lettuce.*—1, Mr. Ross, for Drumhead; 2, Mr. Mackintosh. *Autumn sown Onions.*—1, Mr. Bain; 2, Mr. Ross, for Magnum bonum. The following plants, sent for exhibition, deserve notice, namely, a collection of Seedling Pelargoniums, four species of Gloxinia, specimens of Cucumbers and Myatt's Giant Rhubarb, from Altyre; a fine collection from Holme, containing two very large Hydrangeas in flower, one blue and the other light pink; a Seedling Pelargonium; a large healthy plant, in full flower, of Boronia crenulata, &c.; Heaths and Calceolarias from Dochfour a large assortment of Seedlings from Ness Castle, especially six Calceolarias, six Mimuli, with Eutaxia myrtifolia, Schizanthus retusus, &c.; a collection of Exotics and Seedlings from Raigmore House; and four stalks (weighing 24 lbs.) of Myatt's Victoria Giant Rhubarb from Springfield Cottage Gardens.—*Inverness Courier.* [In consequence of this being the most northerly and remote Horticultural Society in the British Isles, and therefore an unusual importance being attached to its proceedings, we have thought fit to depart from the general rule, and insert it at full length, even although the names of all the winning flowers are not given.]

Isle of Wight Horticultural Society, July 3.—This was the first Exhibition for the season. The weather being fine, the company was numerous. The collections were not plentiful; but in point of good cultivation, they have not been surpassed at any previous Show. The display of Fruit and Cut Flowers was excellent. The prizes were awarded as follows:—*Stove and Greenhouse Plants*: 1, Mr. E. Barnicle, gr. to J. Percival, Esq., for Ixora coccinea, Turnera elegans, Rondeletia speciosa, Achimenes grandiflora, Columnea Schiedeana, and Gloxinia rubra; 2, Mr. E. Meehan, gr. to Col. Harcourt, for Lilium japonicum, Vinca rosea, Vinca rosea alba, Polygala oppositifolia, Achimenes longiflora, and Erica Hartnelli. *Fuchsias*: 1, E. Barnicle, for Champion, Robusta, Nobilissima, Victory, Britannia, Venus Victrix, Lanelli, Insignis, Magnifica, St. Clare, Fulgens multiflora, Multiflora, and Grandiflora; 2, E. Tamworth Horticultural Society, June 26.—This was the first Exhibition for this season. Roses were numerous and in great beauty. The Prizes were awarded as follow:—*Roses*, dark, 1, Prince Charles, Mr. Holmes; 2, La Saussure; 3 Venus Vine, Mr. Cowdrey. Rose: 1, Duke of Devonshire, Mr. Holmes; 2, Wood's Garland and Blush Provence, Mr. Cowdrey. Red: 1, Marshal Mortier, Brennus and Fulgens, Mr. Cowdrey. White: 1, Theodore, Mr. Cowdrey; 2 Madam Hardy, Mr. Holmes. Striped—Village Maid, Mr. Cowdrey. Yellow—Harrisonii, Mr. Holmes. *Pinks*: Purple-laced—Huntsman, Lord Calthorpe, and Venus, Mr. Cowdrey. Red-laced—Conservative and Cleopatra, Mr. Cowdrey. *Pelargoniums*: Queen of Fairies, Van Amburg, and Wilson's Enchantress, Mr. Holmes. *Fuchsias*: Epsii, Brockmannii, and Monypenni, Mr. Holmes. *Calceolaria*: Holmes's Prince Albert, Lady Constable, Standishii, and Delicatissima, Mr. Holmes. *Herbaceous Plants*: Phlox Drummondii, Mr. Holmes. *Pansies*: 1, Mr. Holmes, with Princess Royal, Queen of Whites, Dark Beauty, Miss Stamforth, Azurea, Jewess Superb, Cyclops, Regulator, Bath Champion, Prince Albert, Delicata. 6 *Varieties*: 1, Mr. Cowdrey, with Black Prince, Duke of Wellington, Seedling, Eclipse, Queen of Yellows, and Cowdrey's Prince of Wales. *Best Annual*: Viscaria oculata, R. Browne, Esq.

Vale of Evesham Horticultural Society, June 21.—This was the third Show. Roses and Pinks were abundant, and in excellent order; but Ranunculuses were not good, the season having been exceedingly unfavourable to their growth. *Ranunculuses*.—Dark or Purple: 1, Vulcan, W. Barnes, Esq.; 2, Pigeon, Mr. R. Waitford; 3, Concordia, W. Barnes, Esq. Striped Orange or Yellow: Brabancon, Miss Huntley. Sulphur: 1, Canary, Mr. R. Whitford. Pink: Cramoisie, Miss Huntley. *Pinks*.—Purple Laced: Benkel's Queen Victoria, W. Barnes, Esq. Red Laced: Barnes's Attila, W. Barnes, Esq. Stars or Plain: Hodges' Mountain of Snow, W. Barnes, Esq. *Roses*.—1, Monteau Royal, General Merlin; 2, Chenedole, F. Davies, Esq.; 3, Brennus, General Marriott; 4, Coup d'Amour, F. Davies, Esq.; 6 Yellow, Odorato, Mr. Drury. *Stove or Greenhouse Plants*.—1, Erythrina Crista galli, Mr. Clarke; 2, Fuchsia fulgens, E. Rudge, Esq.; 3, Erica cerinthoides superba, Mr. Clarke. *Pelargoniums*.—1, Sylph, Mrs. Ashwin; 2, Masterpiece, Mr. Clarke.—*Worcester Herald*.

Worcestershire Horticultural Society, May 17.—This was the second Show for the season. There was a very scanty collection, but the specimens were excellent. The following is a list of the prizes awarded:—TULIPS.—*Flamed Bizarre*: 1. Brown's Picta; 2. Admiral, Mr. T. Brown. *Feathered Byblomen*: 1. Jesse; 2. Ambassador of Holland; 3. Brown's Queen, Mr. T. Brown.—*Flamed Byblomen*: 1. Baguet; 2. Princess Charlotte, Mr. Biddell; 3. Roi de Congo, Mr. T. Brown. *Feathered Rose*: 1. Brown's Colonel; 2. Brown's Queen, Mr. T. Brown. *Flamed Rose*: 1. Triomphe Royale, Mr. Biddell; 2. Queen Caroline, Mr. T. Brown. *Selfs*: 1. Mine d'Or, Mr. Biddell. *Pelargoniums*: 1. Coronation; 2. Masterpiece, Mr. T. Cook; 3. The King; 4. Dennis's Perfection, G. J. A. Walker, Esq.; 5. Priory Queen; 6. Joan of Arc, Mr. T. Cook. *Calceolarias*: 1. Prince of Wales, Mr. T. Burlingham, jun. STOVE PLANTS.—1. Euphorbia splendens, Mr. Bennett; 2. Cactus speciosissimus, Mr. Cook. *Greenhouse Plants*: 1. Azalea pœmcea, Mr. Wood; 2. Fuchsia Frostii; 3. Venus Victrix; 4. Tropæolum pentaphyllum, Mr. Bennett. *Hardy Shrubs*: 1. Rhododendron Smithii, Mr. T. Burlingham, jun. *Cape Heaths*: 1. Erica dilecta; 2. E. ventricosa coccinea, Mr. Stanton. EXTRA PRIZES.—Erica propendens, Mr. Stanton.—*Berrow's Worcester Journal*.

Worcester Horticultural and Floral Exhibition, June 25.—This was the Third Exhibition. It was well attended. The Ranunculuses were a complete failure, owing to the unfavourable weather. Of Roses and Pinks there were some good specimens from W Barnes, Esq. The Prizes were awarded as follows: *Ranunculuses*—White ground, Striped, &c.: 1, Model of Perfection, Mr. Brown; 2, Lord Durham and Unknown, Mr. Bond. Yellow: 1, Unknown and Harlequin, Mr. Bond; 3, Suprema alba, Mr. Brown. Orange and Yellow Selfs: 2, Isabella, Mr. Brown. Scarlet and Crimson: Amaranth, W. Barnes, Esq. Light: Charlotte, Mr. Bond. *Pinks*.—Single, Purple Laced: 1, Buncle's Queen Victoria, W. Barnes, Esq.; 2, Vesta, Mr. J. Hooper. Red: 1, Hodges' Madame Vestris, W. Barnes, Esq.; 2, Princess Alice, W. Barnes, Esq. Plain: 1, Mountain of Snow, W. Barnes, Esq.; 2, Unknown, Mr. Keeley. *Roses*: 1, Duc de Trende, J. C. Nott, Esq; 2, Unknown, Mr. Stanton; 3, Richelieu, Mr. Brown; 4, Boula de Nanteuil, Mr. J. Hooper, jun.; 6, Kean, Mr. J. Hooper, jun.; 9, Unknown and Monteau Royal, Mr. Stanton; Devoniensis, Mr. T. Burlingham, jun. *Stove Plants*: 1, Achimenes grandiflora, Mr. Bennett; 2, A. longiflora, Mr. Bennett; 3, Euphorbia splendens, Mr. T. Burlingham, jun.; 4, Gloxinia maxima, E. Shelton, Esq. *Greenhouse Plants*: 1, Fuchsia magnifica and Frostii, Mr. Bennett; 3, Calceolaria Prince of Wales, and Fuchsia conspicua arborea, Mr. T. Burlingham, jun. *Pelargoniums*: Sylph, Mr. T. Burlingham, jun. *Herbaceous Plants*: 1, Calceolaria Lady Constable, Mr. T. Burlingham, jun.; 2, Pentstemon gentianoides, Mr. Cook. *Heaths*: Ventricosa superba, Mr. Stanton. *Annuals*: Schizanthus pinnatus, Mr. J. Hooper. An EXTRA PRIZE was awarded to Mr. Stanton for Campanula garganica.—*Worcester Herald*.

Wingham Horticultural and Floral Society, June 20.—This Exhibition was excellent for the season; the show of fruit was not so plentiful as usual, but good of the kinds. Among flowers the most conspicuous were the Heaths and Calceolarias of J. P. Plumptre, Esq.; the Pelargoniums of J. Godfrey, Esq.; the Fuchsias of D. Denne, Esq.; and the Roses of Mrs. Hudson. The following prizes were awarded: FLOWERS.—*Pelargoniums*: 1, Enchantress, Bridesmaid, Matilda, J. Godfrey, Esq.; 2, Nymph, Bridegroom, Comte de Paris, J. Godfrey, Esq. *Pelargonium*: Matilda, D. Denne, Esq. *Calceolarias*: Lady Constable, Rival King, Royal Standard, J. P. Plumptre, Esq. *Fuchsias*: 1, Fairy Queen, Eppsii, Exoniensis, D. Denne, Esq.; 2, Magnifica, Monypenni, Racemiflora, J. Godfrey, Esq. *Fuchsia*, Exoniensis, Mr. Sankey. *Cactus*, Ackermanni and speciosissimus, P. Plumptre, Esq. *Balsams*: Mr. Sankey; *Best Bulb*: Watsonia coccinea, Mrs. Hammond. *Climber*: Tropæolum tricolorum, Mr. Keeler. *Rose*: Mansais, J. Godfrey, Esq. *Stove Plant*: Vinca rosea, Marchioness Conyngham. *Greenhouse Plants*: Pimelea decussata, Siphocampylus bicolor, Mahernia incisa, Angelonia salicifolia, Abutilon striatum, Erica ventricosa breviflora, Marchioness Conyngham; three ditto: Metrosideros floribunda, Pimelea decussata, Polygala cordifolia, Lady Bridges. *Single Specimen*: 1, Pimelea decussata, J. Godfrey, Esq. *Roses*: 2, Brennus, George the Fourth, Madame Hardy, Maria, Leonida, Beauty of Billiard, Crimson Perpetual, Petit Pierre, Lady Fitzgerald, and four others, Lady Bridges. 12 *Roses*: Blush Moss, Moss Perfection, Beauty of Billiard, Le Gouve, Brennus, Petit Pierre, Duchess Buccleuch, Duchess Luxembourg, Bourbon Queen, Catel, Belle Marie, Fimbriata, Mrs. Hammond. 12 *Pansies*: 1, King of Yellows, Lord Francis Egerton, Queen of Whites, Eclipse, Regulator, Curion, Exquisite, Mulberry, Prince Albert, Souter Johnny, Jehu, and a Seedling, Mr. T. Quested; 2, Curion, Cream, Regulator, Prince Albert, Souter Johnny, Sulphurea elegans, Jewess, Imogene, Lord Francis Egerton, Corunna, Peter Dick, Rufus, Mr. T. Quested. *Verbenas*: 1, Burleyana, Taglioni, Van Geertii, Hosackii, Queen of the Whites, Tweediana, Odora rosea, Variegata, Ignea, S. M. Hilton, Esq.; 2, Odoratissima, Variegata, Formosa, Taglioni, Melindres, &c., Lady Montresor. *Annuals*: Phlox Drummondii, D. formosa, Schizanthus Hookeri, Sweet Pea, Lobelia gracilis, Collinsia bicolor, Bartonia aurea, Italian Poppy, Larkspur; Venus's Looking-glass, Tropæolum canariense, Godetia rubicunda, D. Denne, Esq. *Pelargoniums*: Enchantress, Madelina, Firebrand, Commandant, Cyrus, Zenobia, J. Godfrey, Esq. FRUIT.—*Melon*: Beechwood, Lady Montresor. *Bunch of Grapes*: 1, Black Hamburgh, Sir B. W. Bridges, Bart. 2, Ditto, D. Denne, Esq. *Strawberries*: 1, Downton, Mr. J. Elgar. 2, Ditto, J. Dadds, Esq. *Cherries*: Mayduke, the Rev. E. Gregory. *Dessert Apples*: 1, Sharp's Russet, Mr. J. Elgar; 2, Ditto, J. Dadds, Esq. *Kitchen Apples*: 1, Royal Russet, J. Dadds, Esq.; 2, French Crab, Mr. Foxtall. *Pears*: Easter Bergamot, Mr. J. Elgar. EXTRA PRIZE.—*Greenhouse Plants*: Erica ventricosa coccinea, E. vestita alba, E. ventricosa breviflora, Aphelexis superba, Pimelea decussata, J. P. Plumptre, Esq., M.P. *Heaths*: Erica vestita coccinea, E. perspicua, E. Beaumontii, J. C. Plumptre, Esq. M.P. A collection of British Orchidaceous flowers, contributed by Miss Montresor, was greatly admired; it comprised the following sorts:—Gymnadenia conopsea, G. bifolia, Orchis pyramidalis, O. morio, O. maculata, Ophrys apifera, O. muscifera, Listera ovata, Neottia nidus avis.

York Horticultural Society, June 29.—This was the third for the season; there was a greater number of well-grown specimens than has been observed at either of the previous meetings which have been held this year. The following Prizes were awarded:—*Ranunculuses*: Light-purple or grey, Mr. Hepton, for Bishop Van Lima. Yellow and Orange-striped, Mr. Hepton, for Melange. Yellow and orange, spotted, mottled, or edged, 1, 2, and 3, Mr. Hepton, for Tyso's Edgar. *Collection*: Mr. Hepton, for Duke of Bedford, Cox's Buff, Snowball, Model of Perfection, Mélange, Caroline, and three of Tyso's seedlings, viz., Prefect, Edgar, and Adolphus. 6 *Blooms*: Mr. Hepton, for Tyso's Adolphus, Tyso's Edgar, Naxara, Duke of Bedford, Model of Perfection, and Mélange. *Roses*: Dark, 1 and 2, Mr. Appleby, for Admiral de Rigney and Clementine Duval. Light, 1, Mr. Appleby, for Noisette Ne Plus Ultra; 2, Rev. W. Taylor, for Reine de Golconda; 3, Mr. Cowburn, for China Boisnard; 4, Mr. Harrison, for Yellow Noisette; 5, Mr. Appleby, for Caroline. *Pansies*: 1, 2, and 3, Messrs. Backhouse, for William Penn, Yorkshire Eclipse, Beauty of Holdgate, Ebor, Abigail, Earl of Zetland, Kitley's Bathonia, Lama, Carpenter's Princess Royal, Thompson's Eclipse, Ditto Duchess of Richmond, Ditto Jehu, Ditto Britannia, Ditto Delicata, Ditto Yellow Defiance, Vivid, Liugard's Jewess, May's Imogene, Brown's Curious, Lord Francis Egerton, and four Seedlings. *Pelargoniums*: 1, J. Roper, Esq., (President's Prize,) for Victory, Mabel, Erectum, Decorum, Prince Albert, Lelia, Masterpiece, Coronation, Alexandrina, Bridegroom, Florence, and Grand Duke; 2, Mr. Edward, for Grand Duke, Bridesmaid, Sylph, Jubilee, Joan of Arc, Mabel, Arabella, Alexandrina, Flash, Erectum, and Surprise; 6 varieties: 1 and 3, Mr. Edward, for Bridesmaid, Mabel, Victory, Lelia, Florence, and Erectum; and for the 3d Prize, Decorum, Joan of Arc, Lady Broughton, Sylph, Sir Walter Scott, and Jupiter; 2, J. Roper, Esq., for Matilda, Masterpiece, Comte de Paris, Grand Duke, Sylph, and Alexandrina; Dark varieties: Mr. Edward, for Grand Duke, Coronation, Comte de Paris, and Arabella; Light ditto: Mr. Edward, for Florence, Lelia, Victory, and Bridesmaid. *Stove Plant*: 1, G. Swann, Esq., for Russelia juncea; 2, G. Hudson, Esq., for Gesnera splendens, (President's Prize); 3, J. Roper, Esq., for Gloxinia rubra; 4, Messrs. Backhouse, for Achimenes longiflora; 5, J. Roper, Esq., for Gloxinia zebrina. *Cactus*: 1, Mr Appleby, for Cactus speciosissimus; 2, W. D. T. Duesbery, Esq., for the same; 3, Mr. Edward, for Cactus Ackermannii; 4, Rev. D. R. Currer, for Cactus Jenkinsonii. *Climber*: 1, Mr. Edward, for Thunbergia alata aurantiaca; 2, Messrs. Backhouse, for Thunbergia alata alba; 3, Mr. Edward, for Thunbergia alata. *Greenhouse Plant*: 1, Mr. Edward, for Pimelea decussata; 2, Mrs. Willey, for Nerium splendens; 3, Mr. Edward, for Epacris grandiflora; 4, Messrs. Backhouse, for Scutellaria splendens; 5, Mr. Appleby, for Statice sinuata. *Annual*: 1, Messrs. Backhouse, for Viscaria oculata; 3, C. Harris, Esq., for Clintonia pulchella; 4, Mr. Edward, for Schizanthus pinnatus. *Erica*: 1, Messrs. Backhouse, for E. tricolor; 2 and 3, Messrs. Backhouse, for E. ventricosa superba; 4, Rev. W. Taylor, for E. tricolor; 5, The Lord Mayor, for E. ventricosa. *Spotted or Mottled Calceolaria*: Mr. Appleby, for The Queen, Prince Albert, Formosissima, &c.; *Blotched or Clouded Calceolaria*: Mr. Appleby, for Queen of the Isles and Alba perfecta; *Self Calceolaria*: 1, Mr. Harrison, for Tam o' Shanter; 2, Mr. Appleby, for Green's Denholmia. *Verbena*: Mr. Appleby, for Delicata and striata. *Fuchsia*: 3, Mr. Appleby, for Stanwelliana. *Hardy Plant*: 3, Mr. Appleby, for Pentstemon splendens.

Reviews.

A Narrative of a Visit to the Mauritius and South Africa. By James Backhouse. 8vo. Hamilton & Co.

AT p. 142, of our volume for 1843, we briefly noticed a former work by Mr. Backhouse, on the Colony of New South Wales and its Dependencies. We have now before us another volume, equally rich in interesting facts concerning the Cape of Good Hope and Isle of France. Here, too, we have some instructive portraits of the trees of South Africa.

With the objects of the author, which were of a religious character, it is beyond our province to meddle. All we have to do is to pick out from among the many interesting statements regarding the vegetation of the country he visited, a few passages which may be an inducement to the reader to desire a nearer acquaintance with the work itself.

The following sketch of the *locale* of Paul and Virginia cannot be read without interest:—

"The route lay through Pamplemousses, a small village with a Papal place of worship, seven miles from Port Louis, and famous for its botanic garden, and for a tomb, raised to the memory of Paul and Virginia; the

tale respecting whom was founded on some circumstances connected with a shipwreck on the 'Ile d'Ambre,' near Mapou, which were embellished by the author of the tale. On the borders of a shady part of the road near Pamplemousses, the beautiful orange and white varieties of Thunbergia alata were growing, much in the manner that Ground-Ivy grows in England; and by the side of a brook, there was a species of Papyrus or Paper Reed; and a remarkable Palm from Madagascar, from the fibres of which beautiful cloth, resembling stuff, is manufactured. The country between Port Louis and Pamplemousses is grassy, nearly flat, and but little cultivated, up to the foot of the mountain ranges of the Pouce, Moka, and Peter Bot. Beyond the village, the country is more undulating. Much of it is covered with fragments of vesicular basalt, among which the Sugar-cane is cultivated. In many of the fields, the stones are collected into ridges, about four feet apart, and in others, into squares; the canes are planted in the interstices between these rude walls. Some of the stones are small and others as large as a man's head, but the soil among them is adapted for the growth of the Cane, which thrives even in the fissures of the rocks, where the stones preserve it from drought. In some places there are also fields of Manioc, and plantations of Bananas, &c. In others the wood has not been cleared, and among it are many trees of Ebony, *Diospyros Ebenum*; also Custard-Apples, Guavas, &c. that have become wild."

Again, in speaking of the Botanic Garden of Port Louis, the author says—

"We accompanied our friends George and Jane Clark in a ride to Pamplemousses, and spent a little time in the Botanic Garden. This institution is not so well kept up under the English Government as it was under the French; but it contains an extensive collection of trees, shrubs, and herbaceous plants from various parts of the world. The assemblage of stately Palms is very fine, and there is an interesting group of trees and shrubs producing spices, such as Cassia, Cinnamon, Cloves, and Nutmegs. The fruit of the last is something like a Green Chissel Pear; when ripe, it splits open and exposes the Nutmeg enveloped in a coating of bright-red Mace. A specimen of the tree affording the poison used in the Ordeal, in Madagascar, by which great numbers of human beings are annually destroyed, is also preserved in this garden."

We have the following graphic account of the "Ravenala," and some other plants.

"The Travellers' tree, *Urania speciosa*, forms a striking feature in the prospect. Clumps of these trees, composed of several stems, rising from the same root, are scattered over the country, in all directions. The trunks, or more properly root-stocks, which are about three feet in circumference, sometimes attain to thirty feet in height; but whether of this elevation, or scarcely emerging above ground, they support grand crests of leaves, of about four feet long, and one foot wide, but often torn into comb-like shreds. The head is of a fan-like form, and the flowers, which are not striking for their beauty, are white, and produced from large, horizontal, green sheaths. The foot-stalks of the leaves, which are somewhat shorter than the leaves themselves, yield a copious supply of fresh water, very grateful to the traveller, on having their margins cut away near to the base, or forced from contact with those immediately above them, especially those about the middle of the series. The root-stock is of a soft cellular substance, and the fruit, which resembles a small Banana, is dry, and not edible. This remarkable vegetable production is said to grow in the most arid countries, and thus to be provided for the refreshment of man in a dry and thirsty land. Probably the water may originate in the condensation of dew, and be collected and retained by the peculiar structure of the leaf; it has a slight taste of the tree, but is not disagreeable. The Badamier, *Terminalia Badamia*, a handsome tree, with large, obovate leaves, and fruit, the size of an Almond in its husk, abounds in this direction. The spongy shell is so tough as to render access difficult to its small kernel, which is like a young Hazel-nut in flavour. A species of Cinnamon, *Laurus cupularis*, forms a handsome bush in the borders of the woods. I also noticed a species of Mimusops, forming a small tree, with a fruit the size of a nonpareil Apple.

"The Mango, *Mangifera indica*, which was introduced into this island, had become naturalised here, along with several other fruit trees, such as the Apple-fruited Guava, *Psidium pomiferum*, and the Jamrose, *Jambosa vulgaris*. The Pine-apple, *Bromelia Ananas*, forms impassable thickets: its fruit is sold for a few pence at the bazaars. *Gloriosa superba*, or an allied species of this beautiful plant, of the Lily tribe, was growing in an elevated wood, by the side of a streamlet, on the borders of which *Andromeda salicifolia* formed a considerable tree. Numerous species of *Pandanus*, or Screw-pine, Ferns, climbers of the Convolvulus tribe, some of which were very beautiful, and many other interesting plants, were also growing here. Twice, in the course of my walk, my hat came in contact with the naked combs of a large ochre-coloured wasp, which suspends its nests in the bushes. As soon as the buzz of the enraged insects apprised me of the injury I had committed, I hastened through among the bushes, without looking behind, and the return of the twigs drove the wasps back; but on the second occasion, a briery branch caught me by the sleeve, and detained me till one of my antagonists had avenged itself by stinging my finger. The sting is about equal to that of an English wasp; the burning pain subsided in a few minutes, on pressing out the poison, and sucking the part affected. The poison was distinguishably acid. The Creoles eat the larvæ, or grubs, which they roast in the combs; in taking the nests, they drive off the wasps by means of a burning rag fastened to the end of a stick. The combs are sold in the bazaar at Port Louis. On the muddy margins of a salt-water bay, there are two arboreous species of *Erythrina*, or Coral-tree, the pea-like flowers of which are crimson-red; *Hibiscus tiliaceus*, *Thespesia populnea*, trees with leaves like the Lime-tree, and yellow flowers, with crimson eyes, resembling those of the Hollyhock; *Rhizophora mucronata* and *Bruguiera gymnorhiza*, Mangroves of Laurel-like figure, with large seeds, emitting thick roots while hanging to the tree. To the south of Mahébourg, in a similar association, is the silvery-leaved *Edwardsia denudata*, with yellow, pea-like flowers, possibly the same as that on Moreton Island, New South Wales, where, also, several other plants similar to those growing here are met with. In a brook that discharges itself into the Rivière des Créoles, a large, smooth, black Neritina was adhering to the rocks."

An account of the mountain vegetation of the Isle of France must, for the present, conclude our extracts.

"We walked to the top of the Pouce, and enjoyed the various beauties and curiosities of creation, presented in the primeval forest of the upper part of the mountain; in which, however, many exotic trees and shrubs have now become naturalised; among these are the Lemon, Guava, Jambos, Date, &c. The Bigarade or Seville Orange, *Citrus vulgaris*, is considered native here. The top of this mountain is 2639 feet above the level of the sea. The ascent is along the rocky and woody side of the glen, at the lower end of which Port Louis is situated. A footpath winding along the rocks, passes nearly over the summit, to the vale of Moka, and saves more than six miles of the distance, the high road winding round the end of the mountain. This footpath is chiefly travelled by Blacks, formerly slaves, now apprentices, who carry great loads on their heads, to the bazaar of Port Louis. The heartless cruelty of systematic oppression, the offspring of slavery, does not allow them to wear shoes to defend their feet, though they generally require sticks to steady their steps among the rocks. The vegetation of the upper part of the mountain resembles that of the mountain tract about Cure Pipe. Similar tree Ferns and species of Pandanus are here, and epiphytes, of the Orchis, Fern, and Pepper tribes, grow on the trunks of the larger trees. In the shady parts of the forest, there are several species of Club-moss, *Lycopodium*, some of which are of the section of the genus to which *L. helveticum* belongs. The apex of the mountain is almost too narrow to stand upon, and the sides and front are nearly perpendicular. At this point we found the pretty little blue *Lobelia serpens*, and a plant of the Heath tribe, *Salaxis arborescens*, the last of which cheered us, by bringing to recollection its British allies, not having seen anything so like an English Heath for nearly seven years. *Rhipsalis mauritiana*, and *Sarcostemma mauritiana*, leafless, filiform plants, with green stems, the thickness of a quill, were growing upon the rocks midway down the mountain: the former is allied to the Cactuses of America, and the latter has congeners in Africa and New South Wales. Here are also great numbers of large snails, with oblong shells, mottled with brown and white. These snails are eaten by the Blacks, and the shells are sent to England, to decorate the mantle-shelves of the curious."

The lovers of Natural History will find a large field of interesting facts in the remainder of this volume, from which we purpose to borrow from time to time.

Miscellaneous.

New Facts respecting Trees killed by the Effect of Paint and Oil.—In the Number of last March, page 572, we mentioned the loss of a great many fruit trees from the effect of paint. A gardener of Châlon-sur-Saône declared, at a meeting of the Horticultural Society of this town, that, having nailed up some Peach and Apricot-trees upon a trellis freshly painted with verdegris, towards the end of June, in a short time they all died, except one Apricot-tree, which only lost the branches which were attached to that part of the trellis that had been painted. Another gardener reported also that, having rested some bars of wood painted with verdegris upon some Pear-trees, he observed that deep cancer suddenly formed wherever the paint had left any marks. A gardener from the department of Haute-Marne, M. Delisle, wrote to us, saying he had seen trees die from oil which had been spread upon the branches to destroy the caterpillars. The use of soft soap, of which oil is the base, says this gardener, has caused the branches of trees which have been rubbed with it to die.—*Revue Horticole.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Before advancing farther, let us ascertain if those stove-plants which we have lost, or found difficult to manage in former winters, are now in a state likely to give less trouble during next winter; examine their pots, and if the soil or drainage is not in a proper condition, shake the mould away from the roots, and repot them in light soil. Sandy-loam is better for wintering delicate stove-plants in than composts containing either peat or leaf-mould; peat is very liable to get soddened in a close stove in winter, but in frames and greenhouses nothing suits better. In the beginning of the growing-season all kinds of stimulants were in requisition to insure a rapid growth, but, from this time, all safe modes of retarding vegetation should be resorted to, in order that this season's growth may be ripened as much as our means can effect. These general rules may be of more use than minute details.

Conservatory.—Now, when many will begin to cut down their Pelargoniums, let me guard the inexperienced against two extremes: formerly we used to cut our plants to mere stumps, and now some cut them by far too long, for the sake of making large specimens next year: and with care this may be effected: but the safest way for beginners is to cut the lower-side shoots of this season's growth to 3 or 4 eyes, and if the plants are tall, to cut in the centre shoot to 1 or 2 eyes. Three years old plants make the finest specimens for ordinary use, providing the roots are healthy. Very old plants of Pelargoniums, that are to be discarded, had better be planted in the open ground, and they will furnish good cuttings in September, which may be kept in stove-pots through the winter, and they will come in useful for succession next summer.

Greenhouse.—Many of the greenhouse plants might be improved by being turned out into the open ground now for six weeks or two months; others might be plunged, with their pots, an inch or two below the surface, when many of their roots turn up to the surface, and thus occupy the whole of the ball instead of being crowded at the bottom of the pot, as is usually the case.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The work in the flower-garden at the present time is in a great measure routine. Attend to the regulating of all plants and beds, and keep everything as clean and neat as possible. Ply the broom, scythe, hoe, rake, and roller diligently, and at all times. Remove dead flowers and keep a sharp eye to insects and mildew, which is making its appearance on the Roses since the rain.

Reserve Garden.—Some of the biennials will now be fit to thin out a little, and the young plants may, if required, be pricked out in nursery beds for transplanting. Hoe the ground among the plants frequently, not only to destroy weeds, but also to promote the growth of the plants.—*W. P. A.*

[The reader will please to correct the following error in the last Calendar:—Reserve Garden, last line—for "earthings" read "cuttings."]

III.—FLORISTS' FLOWERS.

Carnations.—The green fly, which congregates on the buds, and the minute black insect which, beneath the calyx, eats away the coloured parts, both in Carnations and Picotees, are more numerous and mischievous than usual. The attacks of the former are more easily prevented (being an open foe), whilst the insidious depredations of the other can with difficulty be repressed. We have found dusting the calyx with Scotch snuff, previous to its opening, the best preventive (amongst many) which we have tried. Continue to tie the buds as they advance; waxed thread, wound round the top part about thrice, twisting the ends together with the finger and thumb, will be found the most safe, easy, and expeditious method. An old florist in the north used to get some Windsor Beans, and cut them transversely, in sections of about the eighth of an inch; when the inside was removed, the skin formed a small hoop or ring; he would fit these lightly on his buds, according to their size: the exposure to the air caused them to shrink, thus fitting the calyx closely, and certainly this was a very neat as well as effectual means of attaining the end proposed. We have yet a novel and simple plan in operation, to prevent the bursting of the calyx, the successful adaptation of which to our own stock will induce us to communicate it shortly for the benefit of our readers. Continue to put down layers; pegs of fern or wood are made use of: we give the preference, however, to those made of lead. Shade the expanding flowers from sun and rain; and amid the multifarious manipulations required just now of the Carnation grower, the best means of raising good seed must not be forgotten, and manual impregnation by all means should be resorted to. *Pinks.*—Continue to plant out rooted pipings. Look well to pods of seed, extract the decayed petals, and shut the calyx down to prevent the extension of wet, which will inevitably cause decay and the loss of the seed. *Dahlias*—Must be regularly tied up to their stakes, as they are now making vigorous growth; occasional waterings with liquid manure will be of service. *Tulips.*—As we presume they are all safely stored, an occasional glance, to see that all is going on right, is all that is now requisite.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—From now to the end of October is the season most favourable to the growth of Pines: and it is necessary to make the most of it, by paying due attention to the wants of the plants in their various stages. The more strength and compactness we can get into the plants, the greater will be the probability of fine fruit; and to obtain the greatest degree of strength, it is requisite that the plants have plenty of room, with as much air as the weather will permit; and that they be kept in a brisk bottom heat of from 85° to 90°. Too much water at the roots should be carefully avoided as there is always a greater number of fibres made when the soil is moderately dry, particularly if it be put in the pot in a rough or lumpy state. Plants with plenty of healthy fibre, and broad, strong, but short leaves, cannot fail to produce fine fruit, other circumstances being favourable. Continue to syringe in the afternoon, and if you have no other means of keeping the atmosphere of your houses and pits moist, the tan and paths may be sprinkled once or twice a day.

Vineries.—Let the Vines now ripening their crop have air early in the morning, and increase it as the day advances. Shut up early with a dry atmosphere. If the weather should become damp make slight fires. This, by causing the fumes of the sulphur on the pipes or flues to ascend, will assist in the destruction of the red spider. Keep the houses from which the crops have been gathered in the neatest order. The Vines in these houses will require the lights to be open night and day. Young Vines of this year's planting should be encouraged to make all the wood possible. I allow all the laterals to grow on these; as it gives early, and with proper after management, permanent strength and vigour to the plants.

Peach-houses.—Should wet weather occur, make slight fires to dry the atmosphere of the houses where fruit is now ripening. This with plenty of air will help to give flavour to the fruit. If red spider make its appearance, dress the pipes or flues with sulphur and quick lime, and make slight fires to render the application more effectual.

Figs.—Leave a little air on all night, and give a great deal during the day. Let the plants be well supplied with water, and syringe daily except where fruit is nearly ripe.

Strawberries.—Where the crop is gathered from the British Queen, and other kinds suitable for forcing (which in most places is now the case), the strongest runners may be carefully put into small pots, with what roots they have made, the pots having been previously plunged at a proper distance from the parent plant, to prevent the runners being shaded by its foliage. It will be necessary to lay small stones on the runners that have not made roots, to keep them in contact with the soil in the pots till they have time to establish themselves. Should the weather prove dry, watering will be beneficial.

Melons.—Pay constant attention to thinning and cutting out decaying leaves. Do not let plants swelling their fruit suffer for want of water, but withhold it by degrees as the fruit approaches maturity.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Budding.—The fine mild showery weather we now have presents a favourable opportunity for budding the stocks of stone fruit-trees, and for inserting buds of esteemed kinds upon the branches of established trees, the sorts of which are not approved of. Propagation by budding, though generally confined to stone fruits, may also be resorted to with advantage with scarce varieties of Apples and Pears. Any statements respecting the mode of operation would be futile, after the plain and lucid directions given in the current year's *Chronicle*. I recollect a striking instance of success that resulted from

budding the Peach on established trees of the Apricot; the shoots from the buds growing freely, and producing plentifully, when the general stock of Peach-trees could not be kept in a healthy state, though great pains were bestowed upon them by a very clever gardener. This fact would seem to intimate that it would be worth while to try Apricot stocks for Peaches to a greater extent than is generally done.

Tomatoes.—Keep these fastened to the wall or fence; thin out the shoots and leaves, and pinch out the points before the clusters of blossoms, where early fruit is desirable. Without the assistance of a wall they will not do much good north of London, unless in favourable situations—though I always regret planting them near a fine tree, they are such gross feeders. For their culture, Capsicums, &c., and the forwarding of early crops, dwarf walls with sloping borders ought to exist in every garden. It is very fashionable to speak of a gardener as an ignorant practitioner who crops perhaps rather closely his fruit-tree borders, though nine cases in ten it is the result not of choice, but of necessity, aware as he is that the somewhat inferior condition of his fruit-trees will not be such an unpardonable evil as being behind with a good early supply of the best vegetables. *Peas.*—A last sowing may now be made of some of the early sorts A sowing of Dwarfs might be made towards the end of the month, where the situation was very favourable, and means of protection could be resorted to. *Asparagus*—The present weather offers a good opportunity for sprinkling the beds with salt, and supplying them with any rich manure you can spare. *Potatoes.*—Those who are partial to young waxy Potatoes may now plant some tubers saved from the earliest crops. If previously greened in the sun they will grow more vigorously. The rows may either be covered with litter on the approach of frost, or they may be dug up, and the produce kept in dry sand. *Cabbage*—Prepare for sowing for the main crop next spring. In cold situations, they cannot be sown too soon now; in warm favourable places, it will be as well to defer it for eight days. *Routine*—Keep planting winter-stuff every favourable opportunity.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—See preceding Calendars for what is required to be done in this department.

Coppice.—Go through these frequently, in order to see what is wanting; what you do not observe at one time you may at another.

Young Plantations.—About this time young Oaks will be making their second growth; therefore young plantations should be frequently gone over, for high winds oftentimes do considerable injury to luxuriant young shoots, and especially to the leaders. Should the latter happen to get broken, they may, in a great measure, be rectified in the same season, and a new leader secured, if properly attended to.

Nursery-work.—Keeping the nursery clean by frequent weeding and hoeing, and attending to pruning and training young plants, is nearly all that is requisite at this season in private nurseries. But remember, no knife should be used now on the young shoots; only the finger and thumb should be employed to pinch off the ends of too luxuriant side shoots.—*W. B.*

VII.—COTTAGERS' GARDENS.

In consequence of the late fine weather, everything is now growing rapidly, and the hoe, which should never be idle, ought to be more than usually active in keeping down weeds and stirring up the ground between the rows of growing crops. The flower borders should also be attended to. Tie up any plants that have been broken down by the late heavy showers, and let Verbenas, which are now making vigorous growth, be pegged down until the space allotted for each plant is covered, after which they may be allowed to grow at random. Particularly attend to the tying of Dahlias, which are very apt to get broken by sudden storms. Remove all crops that have ceased to be useful, as they only exhaust the soil and encourage snails and slugs, and let the ground be prepared for winter Greens, which should now be planted as soon as possible. While the weather is favourable, Celery, if not already done, should also now be planted in beds, which is the best plan for the cottager, as when planted in this way it occupies less ground. If it is intended to make new plantations of Strawberries, select now some of the strongest runners for that purpose; by planting out early they become well established before winter, and often produce a good crop of fruit the following season. In cottage gardens a row is frequently planted along the sides of the walks, so as to encroach as little as possible on the space required for vegetables, and in such situations where the exposure is open they often ripen abundant crops of fine fruit. The soil most suitable for Strawberries is a strong rich loam, but they will succeed well in almost any soil that has been properly manured, and is in good condition.—*J. M'H.*

State of the Weather near London for the week ending July 18, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

The Reprint of Mr. PAXTON'S COTTAGERS' CALENDAR is now ready, price 3*d.* each Copy. An Index has been added to this present Edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5*s.*

BEES.—*Valhalla.*—We really cannot do anything in the matter. All we can say respecting Mr. Pettigrew's proposals is that we have ourselves subscribed to his secret, because we know him to be a most respectable man, whose honey is unsurpassed for excellence.

CARNATIONS.—*W.*—There are several causes which will produce the effect you mention. For instance, the diseased state of the layer at the point of severance from the parent plant; also late planting, especially after such dry weather as we have lately experienced; or should the buds have been infested with Aphis, which have inadvertently been crushed on the pod instead of being brushed off; this would prove highly injurious, and cause the buds to assume a sickly yellow hue. I would recommend watering with an infusion of half a peck of sheep manure in six gallons of water, or with Potter's liquid guano.—*W.*

COLOURS.—*N.O.P.* asks, Why is it that all colours made by man are different by candlelight from daylight, whilst in those of nature hardly any difference is perceptible? In silks and cloth it is almost impossible to distinguish blues from greens, yellows from white; purples and pinks also are affected: not so with trees and flowers. [Will any one answer this question?—we cannot.]

CONIFERÆ.—Never employ manure containing azotised matter for these. It may do very well for Hollies, Laurels, and such evergreens, but is fatal to Cypresses, Yews, Junipers, and the whole Coniferous race.

DAHLIAS.—*Susan.*—We know of no better mode of dwarfing these than pegging them down. It is not necessary to pinch off the flower-buds in order to keep up a later bloom, as Dahlias in general flower well until they are cut off by frost.‡

HEATING.—*G.C.*—Sand is better than sawdust for covering a tank, because the latter will breed fungi. We should have no fear of your having heat enough; the great fear is that the soil will get dry. You must provide ample means of watering the soil as well as steaming the air. If you grow Melons in your pit, cover the tank with neither sand nor sawdust, but with good maiden loam.

INSECTS.—*A Lady.*—Red Spider is not to be destroyed by water; it can only be kept under by such means. A sulphur fumigation is the only effectual remedy.——*S. S. H.*—The Peach-leaf is infested with Aphides. The tree should be syringed with Tobacco-water, and the shoots which most abound with the Plant-lice may be cut off and burnt. The Froth-flies on the Lavender are the larvæ of a Tettigonia, described and figured in the 2d vol., p. 509, of this Journal. *R.*——*A. R. C.*—We shall be happy to comply with your wishes, if you will furnish us with the necessary materials. *R.*——*B. Chilo.*—No. 1 is Curculio scrophulariæ; No. 2, Curculio nubila; 3, Altica testacea. *R.*——*W. M. C.*—Not finding any winged specimens in the quill, we cannot be certain regarding your Aphides, but believe them to be the Cinara laricis of Curtis's Guide. Be so good as to send us living specimens of the Caterpillars, for we cannot tell you what it is that destroys the foliage of your Larches. *R*——*R. N. C.*—The leaves of the Geraniums are affected by damp, and not by insects. The roots of the Pansies are suffering from the attacks of young Snake Millipedes, which are exceedingly difficult to destroy: unslaked lime, or lime-water, will be the best applications, and you will find other remedies and the history of the Juli, in the *Gard. Chron.*, vol. i. p. 196. *R.*——*A. B. C.*—Your insect is Pentatoma rufipes, which generally feeds upon caterpillars, &c. *R*——*B. Chilo.*—The moth is Zygæna filipendulæ; and the other insect is the larva of a bug, called Pentatoma. *R.*

MANURES.—*W. R.*—We really do not see what we can do to satisfy you; we will, however, consider against another week.

NAMES OF PLANTS.—*Zephyrus.*—Periploca græca.——*An Enquirer.*—Plantago major. Destroy it by constantly cutting through the crown of the root with a sharp spade.——*Subscriber.*—Geranium sanguineum.——*T. O. M.*—Oncidium triquetrum.——*H. Doubleday.*—Stachys recta. We never received your former parcel.——*R. Cowans.*—Your leaves are attacked by a parasitical fungus. We really can suggest no better remedy than stripping the tree and burning every one of the leaves.——*W. Bentall.*—Apparently Carex pallescens.§ ——*H. H.*—The Poke-root may be the Phytolacea decandra, called the Virginian Poke.

PELARGONIUMS.—*Simplex.*—These have become diseased no doubt on account of having been kept too dry. Being potted in leaf-mould, chopped turf, and having a good drainage, they require a very great deal of water, especially during such a season as this ‡——*Fanny.*—The truss, cut from the Sylph, which you have sent, bearing a perfectly white flower, among the others, is not an uncommon occurrence; at the same time, nothing is known, beyond a white flower having been one of the parents of the particular variety that bears it. How a single flower in a truss, or an entire truss, should come white, when the rest of the flowers are pink, is a matter involved in obscurity. Having had one branch with a complete truss of white flowers, we recommend you, by all means, to strike it, as the plant produced from this cutting will in all probability produce white flowers—and a white Sylph, with the size and substance of that favourite variety, will be a very desirable acquisition.*

PLANTING.—*A Gaul.*—All that has been published concerning Dr. Thackeray's mode of pruning is to be found in our columns, where it has been often mentioned and commented upon.

RATS.—*X. Y. Z.* is desirous of knowing the meaning of the term "slamm" in a communication by "G. C." on the 25th May last. Moreover, a piece of calico is to be used rather larger than the trap—Is this to be placed under the trap, and the corners tucked in? or are other pieces of calico to be put all around the trap?

RHODODENDRONS.—*Mrs. Gall.*—These may be grown in a chalky soil, provided pits are formed for them, and filled with leaf-mould. The holes should be tolerably wide, but need not be more than eighteen inches deep. Mould composed of loam and leaves will do. Whatever leaves are used must be thoroughly decomposed, and if they can be mixed with one half peat so much the better.‡

STRAWBERRIES.—*G.*—The best varieties for a market gardener, both with regard to quantity and quality, are Keen's Seedling and Myatt's British Queen. The former is an excellent forcer.‡——*J. W. Yellow.*—Your soil being strong, if once unusually dry, no surface watering would have been sufficient to insure the perfection of your Strawberry crop; but under such circumstances, irrigation produces the desired effect. Like yours, plants are apt to die in intervals between imperfect surface-waterings. Your sand is the "sharp silver sand," similar to that used for propagating. It is valuable; and if you have it in abundance, a mixture of it would improve your stiff Strawberry soil.‖——*A Subscriber.*—If your beds of Keen's Seedling exhibit signs of decay, your best plan will be to make a fresh plantation. You may obtain good crops from those that do not yet exhibit such symptoms, if you keep them clear of runners, giving them a top-dressing of light manure and fresh loam in winter. The Elton Strawberry is a late sort, rather acid if not perfectly well ripened. We never before heard it complained of as being tender, and suspect you have not obtained the true kind.‖

SWEET-BRIAR HEDGE.—*D. R.*—This may be obtained by sowing the heps of the Rosa rubiginosa in the autumn as soon as ripe; or, which is better, in the month of March, having kept them in the meanwhile mixed with sand. But it is far more convenient to buy Sweet-briar "layer," (young plants,) from the nurserymen, and to plant them a foot apart early in the month of November. Let them grow as they like for the first year, and cut them down to the ground the second; they will then spring up and require no more future care than occasional trimming with the pruning-knife or shears, so as to keep the hedge in shape. When it gets naked at the bottom it must be again cut down.

VINES.—*A Subscriber.*—The Vine-leaf you sent bears strong marks of the Red Spider, together with a little scorching. As the shoots are too weak for bearing fruit next season, you cannot do better than cut them back to the lowest good eye as soon as their vegetation is at rest for the present season. ——Another *Subscriber*, who has sent a leaf from a Vine that has not been forced:—The disease, appearing as green excrescences, is an extravasation of sap from the small veins on the under side of the leaf, in consequence of obstruction, caused by the dried-up state of the intermediate portions of cuticle.

ZINC LABELS.—*S. E.*—We presume your label is written with the same kind of ink as is usually employed for that purpose, and which is prepared as follows:—viz., verdigris, in powder, 1 drachm; sal ammoniac, ditto, 1 drachm; lamp black, ½ a drachm; and water, 10 drachms.‡

MISCELLANEOUS.—*L. M. N. O. P.*—We do not know where the plants you ask for are to be had. If in the country, an advertisement would produce them.——*J. H.*—No. 16 of last year, and 8 for the present, may be had. No. 5 is out of print—send your address with 12 postage stamps.——*June.*—Your inverted Hyacinth is an instance of a bulb, accidentally planted upside down, attempting to recover its position, and nearly succeeding. It is a curious fact, already known, that Hyacinths will produce coloured flowers, even although grown in the dark. The phenomenon, which is extremely remarkable, has never been explained; nor can we explain it. Possibly the colouring matter is formed the year before; but, if so, where? and in what form is it hidden in the bulb?——*C. J.*—Seeds sent in paper cases go very well to India by the overland mail, without any other care than that of drying them properly. If yours are too bulky, they will go very well by sea, if packed loosely in coarse canvas bags, and kept in a cabin, or some *thoroughly ventilated* place. To put them in boxes of tin, or to send them into the hold, is to kill them. Ripe cuttings taken off in November, with their ends stuck into a Potato, and well covered with an India-rubber or other waterproof envelope, sometimes reach India alive by the overland mail; but they more frequently fail. Such plants are despatched by the Post-office, or if too heavy, by the Indian agents.——*A Lady.*—No plant is more easy to manage than Euphorbia splendens. It only wants a stove heat and a moist atmosphere. It is very difficult to flower some kinds of Cape bulbs. See some remarks on the subject at p. 263 for 1843; where the treatment of Brunsvigias is described.——*N.O.P.*—We never heard of toads eating slugs.——*G. C.*—We are unable to answer your question as to colouring canvas. You had better apply to dyers. In using Whitney's Composition, the linen should be nailed down slackly at first, and then, after the first application, stretched tight before it is renailed——*W. D.*—There is no such thing as male and female Geranium or Fuchsia blossoms. Each flower contains the two sexes.——*A Constant Subscriber.*—The Pelargonium sent under the name of *Comte de Paris*, appears to be the variety named *Erectum*, the foliage of which is smooth and of a deep-green; the one named *Garth's Witch* is a flower of the same colour, but not more than one-third the size of that variety, nor do the under petals appear to be of the same form.*——*A Subscriber.*—The Sweet Briar does not make a good stock on which to bud the Damask and Perpetual Roses, but the Noisette may be budded with success on the Ruga.‡——*J. W. F.*—Your two Vines in pots, infested by red spider, will not be injured by being placed out of doors, and the red spider will be much more easily destroyed in the open air.‡——*T. Cox.*—For the method of laying down an Asphalte path, we would refer you to Leading Article, p. 379, vol. 1842.‡——*J. H. Wilson*—Will find the composition described by "Devoniensis" repeated at p. 392 of this year ‡——*C. K.*—That your Peas are mildewed by the dry weather, there is no doubt; but we do not see how your Vines can have suffered from over-luxuriant growth. Depend on it, if your poor neighbour has an abundant crop of Grapes, while you have none, he must be the better gardener of the two. There is no remedy for your Nectarines now; dry weather has brought Red Spider, and Red Spider has taken off your leaves. All you can now do, is to syringe plentifully and trust to season. On no account shade; if you do, you will have no flavour in your fruit. You will learn how to preserve Green Peas by referring to our vol. for 1842, p. 574.

SEEDLING FLOWERS.

FUCHSIAS.—*Z. Z. Z.*—The best variety among your seedlings is Hebe, being bright and pleasing in colour; but none of these flowers can be regarded as improvements upon those already out*——*J. Y.*—The seedling marked G is the best of your flowers; its great length must render it very showy on the plant. C is very pretty, but the corolla is too little seen. J and H are not new.*——*Foxton.*—Of your seedlings, John Bull is ugly in form, with the corolla so short that it is scarcely seen. The sepals of the President are coarse, and there are many in the same way. Goliah, with light tube and sepals, and a rosy-purple corolla, is very pretty; but it does not surpass others in the same way.*——*J. W. Tenterden.*—We find no improvements in your present batch of seedlings; neither in size, colour, nor texture, are they equal to the numerous varieties already in cultivation. Something new is required, as there is so much monotony in the sorts cultivated, that some decided novelties are necessary to make exhibitions of this elegant flower effective.*

GLOXINIAS.—*A Reader.*—Your seedling is small, and very inferior to some.

PELARGONIUMS.—*H. D.*—Your seedling is a showy flower, of a rich crimson purple; the white centre gives it a lively appearance; it is tolerably good both in form and substance.*——*J. Y.*—Your flower not being well packed, the petals had fallen, and were partially dried up, so that it was impossible to form an opinion of its qualities.*

PETUNIAS.—*C. E.*—Several fine Petunias have been exhibited this season, of the same character as your seedlings. Some of your varieties are very pretty; No. 6 is a fine rich purple lilac; 7 was damaged, but appears to be good in colour; 5, white, with dark veiny purple throat, is a good variety; 4 also. The other varieties want distinctness. You are in error regarding P. punctata. A tray of cut bloom, and plants in pots, covered with flowers, were exhibited at the Hort. Society's Gardens on Saturday last, true to the description given of the flower in this Paper last year.*

PHLOX DRUMMONDI.—*E. Y.*—There is nothing uncommon in your seedling; the colour is bright and pleasing, but the form of the flower is not good.*

PICOTEES.—*R. C.*—Your specimens can only be regarded as border varieties; the petals are too small, and the colour not sufficiently confined to the edge of the petals. 2 and 70 are the best.*——*R. H. M.*—Your seedling Regina fails in the guard petals; they are small, rather crumpled, and not even on the edge. In other respects we like the flower, as the white is pure, the petals of good substance, and the rose edging of a beautiful colour. Enchantress, on the contrary, has very fine guard petals, and the centre ones are split and uneven on the edge; good pod, petals fine in substance, slightly serrated, and the flower rather thin, viz., deficient in the number of petals. Ne plus Ultra is a good-sized flower, with petals of a good form; but several of them are too crumpled and broken, and the petals are also too jagged on the edge, with an inclination in the flower to "bar."*

VERBENA.—*A Subscriber from the Commencement.*—Your seedling being packed up without anything damp about it, was in so dry a state when it arrived that it was impossible to tell its colour; and it would not revive in water.*——*J. Y.*—Your seedling is a very good variety; opening of a delicate blush tinge, changing to white, but bearing a little colour at the tube.*

**** As usual, many communications have been received too late

SEED-WHEAT.—Any one desirous of purchasing Seed for next year is invited to inspect the two varieties of Wheat, SHIRREFF'S HOPETOUN and MORTON'S RED-STRAW WHITE, 120 acres of which are now growing on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE.

The present is the only season of the year when the value of any variety of Wheat as Seed can be ascertained by inspection; for, if the examination of a mere sample of the grain, which can be seen at any time, be nearly uninstructive as to its quality in the eye of the baker (see *Ag. Gazette*, No. 5), it is entirely so as to the productiveness or habit of growth of the variety to which it belongs. These points, which are of the highest importance in the eye of the Farmer, can be ascertained only by an examination of the growing plant when in full ear.

JOHN MORTON, Whitfield, Thornbury.

The Agricultural Gazette.

SATURDAY, JULY 20, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY,	July 23	Implement and Cattle Shows and Meeting of the Agricultural Society of England, at Southampton.
WEDNESDAY,	July 24	
THURSDAY,	July 25	
FRIDAY,	July 26	
THURSDAY,	July 25	Agricultural Imp. Soc. of Ireland.
WEDNESDAY,	July 31	Agricultural Society of England.
THURSDAY,	Aug. 1	Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

July 25	Richmondshire. Grove Ferry.	July 30	Framlingham. Isle of Thanet. Rayleigh
July 26	Debenham. Stoke Ferry. Halesworth.	Aug. 8	Collumpton.
July 27	Cardiff. Gloucester.		

FIFTY-NINE THOUSAND POUNDS' WORTH OF GUANO (we quote from a statement by Mr. Milne at the late meeting of the Scottish Agricultural Chemistry Association) were last year imported into Liverpool alone. But guano is imported direct from its sources into many other ports of the United Kingdom beside this; indeed, advertisers are daily announcing the actual or expected arrival of cargoes direct from African or Peruvian islands at second and even third-rate seaport towns, so that the sum here named is perhaps not an eighth of what has been spent in the purchase of this manure during the present season; and, from the better knowledge which prevails of its fertilising properties, as well as from the enormous supplies which will by that time have arrived in England, we may suppose, that if this year's value of guano sold be reckoned by tens, that which will be bought by farmers next year will be reckoned by hundreds.

Now we ask, Is not the expenditure of some hundreds of thousands of pounds on a substance so often, because so easily, adulterated as this—an expenditure too by parties generally so incapable of detecting the fraud—is not this a subject of serious agricultural importance? It is absolutely necessary that farmers should combine to insure themselves against a source of such serious loss, to the action of which they are so liable; for we can tell them that if the articles which have lately appeared on this subject in the *Agricultural Gazette* have failed to awaken them to their true interest, they have by no means been so uninfluential on the parties whose roguery they exposed. These gentlemen see that it is necessary now to have a semblance of authority for the value of their trash, to insure its sale; and, as illustrative of this, Mr. Gyde, of Painswick, whose name is well known to our readers, lately gave us the following account of an attempt made upon him:—

"The object of the party in sending me the sample of guano so shamefully adulterated, was to ascertain if I would become an agent for its sale; if so, I was to receive a handsome commission, &c. My answer was to be left at a Post-office, and every precaution was taken to prevent the locality being detected, in case the proposition did not meet with a favourable reception. The so-called guano consisted of a mixture of red marl and old mortar crushed together to the extent of 95 per cent.; the remaining 5 per cent. consisted of vegetable matter (probably partially-decomposed sawdust), and genuine guano. This mixture had been moistened with putrid urine, and re-dried. It certainly had the appearance of a fair sample of guano when casually looked at, and would no doubt deceive any person unaccustomed to the genuine article. When moistened with caustic potash, and heated, it only gave traces of ammonia compared with the effect produced on natural guano; and after drying and heating to a red heat, 95 per cent. of inorganic matter was left, which did not contain 1 per cent. of phosphates. I think the answer I sent them will prevent their offering it in this neighbourhood. The largest amount of adulteration of guano I have met with has been 15 per cent., excepting the above instance."

This case, in point of impudence, can be compared only with the notorious instance published by Mr. Solly, in which a manure containing only 3 per cent. of what it professed to be, was considered to be good enough for agricultural purposes.

Well, there can be no doubt after this, and the many other instances we have at various times published, that there is a necessity for vigilant carefulness in the purchase of guano. It is most desirable that Farmers' Clubs, and especially all those in *inland* districts, should adopt the means suggested by Mr. Hyett, of Painswick, in an early Number of this Paper. Let each of them nominate some scientific man as their agricultural chemist, and secure his services at certain rates of charge in the analysis, *before purchase*, of all concentrated manures, natural or artificial. We allude to inland Farmers' Clubs particularly, in reference to the purchase of guano, for farmers near sea-ports can buy at the ship's side; and though, through error, an impure article may have been imported, yet impurities to any considerable amount are, in ninety-nine cases out of the hundred, to be attributed to the roguery of secondary manure dealers, after it has been brought on shore. The general and hearty adoption by Farmers' Clubs of means such as this, would go far to deter dishonest people from attempting this deceit. But the subject must be taken up immediately, if it be intended to exert any influence; for guano is daily arriving in this country, and unless sufficient influence be exerted to the contrary, as soon as it is cheapest it will be bought up from the importers, in order to be adulterated and diluted ready for next spring.

Only one Society, that we know of, has heartily adopted the plan to which we allude, and that—a Society, indeed, formed for the very purpose of securing for the farmer the services of the chemist—is the Agricultural Chemistry Association of Scotland. The Report, in another column, of the half-yearly meeting of this body, is well worthy of perusal. It will be seen what success has attended the efforts which have been put forth in Scotland to bring the farmer and chemist together. The circumstance mentioned at that meeting by Mr. Milne, that all the instances of fraud in the manure-trade, which we have published, have occurred south of the Border, is sufficiently convincing of the influence exerted by the existence of a ready and certain means of detection.

It is not guano alone which these district agricultural chemists would have to analyse—they would find cases of adulteration in many other manures. Mr. Gyde informs us that he lately analysed, for a farmer near Chepstow, in Monmouthshire, a specimen of bone-dust, in which he found 20 per cent. of sand, and 12 per cent. of water, so that, for all agricultural purposes, one third of it was useless. One would think, from the constant occurrence of these instances of fraud by manure-dealers, that, though familiar with it from childhood, farmers were not yet convinced of the expediency of the old rule—

"Taste and try, before you buy."

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

THE word in the above title, which is meant to express the character of the following contributions to the *Gazette*, is intended at the same time to signify that dependence of the farmer's practice on the nature of the soil he cultivates, and therefore on the geological character of his vicinity, which it is my object to illustrate.

South Gloucestershire, perhaps, more than any other district in the kingdom, possesses a very variable geological character; the character of its agriculture is also various, and an attentive survey of it will convince any one, as it did me, that these stand to one another in the relation of cause and effect.

In order that my remarks on its farming may be useful, I must first describe its general appearance and climate.

The district to which the following remarks refer, is that portion of Gloucestershire which extends on the east and south to the boundaries of the county, on the west to the river Severn, and on the north to a line drawn from near the village of Frampton-on-Severn to the town of Stroud. The whole of it is included in No. 35 of the Maps of the Ordnance Survey. Its greatest length, from N.N.E. to S.S.W., is about 26 miles; its greatest width, from N.N.W. to S.S.E., is about 16 miles. Looking at it with regard to the elevation of its surface above the level of the sea, it may be divided into two portions—the one on the elevated table-land of the Cotswold range, and the other constituting the extensive tract in the vale of the Severn between Gloucester and Bristol. The average elevation of the one is from 500 to 600 feet above the average level of the other; and of the 330 square miles which constitute the extent of the whole district, about 80 belong to the hilly portion; the rest to the vale. The two districts are divided by a bold edge or escarpment, stretching between them in a direction N.N.W. and S.S.E. The surface of the table land slopes towards the east, its highest points being always near the edge of this escarpment; and these are, therefore, situations from which a very accurate idea of the general appearance of the whole country may be obtained. In the northern and southern parts of the district the table-land is furrowed out by valleys of considerable extent, which are independent of one another; each is complete in itself, possessing a series of lateral branches, into which, again, a second series of smaller valleys run: their sides thus present a number of recesses and promontories, to which, chiefly, the beauty of their scenery is due. As, at the same time, the rock of which the Cotswold range consists—the oolitic rock—is made up of a series of nearly horizontal beds of various kinds—limestone, clay, and sand—the valleys which cut through this series of beds bear upon their sides the characters of each, and another source of variety in their scenery is introduced.

As all of them occur close to one another, the whole being within a space of ten miles, the high land necessarily stretches out in the form of long arms, which extend as so many headlands into the vale. From the extremities of these arms most beautiful and extensive views of the vale may be obtained; and instead of proceeding to state all the particulars as to the character of the surface of this, the second portion of our district, it may be well to climb one of these heights, and obtain thence a view of its general appearance.

Stinchcombe-hill, which stands further out into the midst of the vale than any of the neighbouring hills, being at the extremity of the longest of the arms just mentioned, will best suit our purpose.

If we climb this hill early on the morning of a summer's day, we shall probably find the whole of the vale covered by a thin stratum of white cloud, which hides from us, as a sea, the whole of the country it rests upon. The high lands on the far side of the Severn appear as a distant coast, ourselves being on the top of one of the boldest headlands which here stretch far into the midst of the strait.

As the heat of the day increases, this cloud gradually disappears, and discloses to us the beauties of the land it had covered. Looking to the north, the west, and the south, we see stretched out before us the vale of Gloucester and Bristol; on looking eastward, behind and on either side of us, we find it bounded by the escarpment of the table-land already described; and as we gradually direct our gaze from north to south over the western horizon, the Malvern hills in the far distance—May Hill—the Forest of Dean—the distant Welsh hills—the open sea in the Bristol Channel—and the Mendip hills beyond Bristol, successively pass under review. These boundaries present every variety of outline and appearance—they form a fit frame for the beautiful picture which they surround. The scenery of the vale itself also varies in its character. Northward its surface is comparatively level; to the south it is irregularly broken up into hill and valley. In the northern part of the vale the city and cathedral of Gloucester may be seen at a distance of 15 miles, and here and there over the whole of it, villages with their church spires make their appearance. We can see very little but pasture land; indeed, with such immense quantity of timber as everywhere covers the vale, arable land could not be cultivated.

Isolated portions, however, in the midst of the thickly wooded country below us—one surrounding the foot of the hill—another near Frampton on Severn—a third between these—and others, are bare, and cultivated by the arable farmer. This hinders any monotony to which the scene would otherwise be liable. The northern part of the vale consists chiefly of a clayey soil; these bare spots occur where a deposit of gravel has taken place over the clay; a difference in the subsoil, thus producing an entire change in the appearance of the surface.

The southern part of the vale is, as I said, broken up into hill and vale. A ridge, or rather escarpment, about 150 or 200 feet high, commencing at Bristol, and running northwards 15 miles, then turning east by Tortworth and Wickwar, and again southwards by Sodbury, incloses a basin-shaped tract of country of considerable extent: and, besides this, many detached hills occur here and there, as in the neighbourhood of Thornbury and Berkeley, adding to the irregularity and beauty of the scenery.

The climate of this district does not vary much in point of temperature, being of such limited extent. It is probably, however, always from 2° to 4° colder on the table land than in the vale, and this, where, as in this case, it is united with a much greater degree of exposure, will make a great difference in climate.

At Bristol, the following is the monthly average temperature, in degrees of Fahrenheit's thermometer:—

January.	February.	March.	April.	May.	June.
37.3	40.2	41.1	47.1	55.8	61.9
July.	August.	Sept.	Oct.	Nov.	Dec.
63.	61.5	57.6	51.7	43	40.6

The average number of wet days in the year at Bristol, is 166, which are divided out among the months as follows:—

January.	February.	March.	April.	May.	June.
15	12	16	10	9	12
July.	August.	Sept.	Oct.	Nov.	Dec.
14	12	13	16	20	17

At Cheltenham, the following are the results of meteorological observations, which have been carried on for seven consecutive years, during the first eight months of the year; and for five years, ending 1837, during the remaining four months. The average temperature for each month is as follows:—

January.	February.	March.	April.	May.	June.
37.6	40.4	41.5	46	53 6	59
July.	August.	Sept.	Oct.	Nov.	Dec.
61.1	59.7	55.5	50.4	43.9	41.5

The average quantity of rain which falls in the year at Cheltenham is, according to these observations, 31.81 inches, which is divided amongst the months as follows:—

January.	February.	March.	April.	May.	June.
2.17	3.55	2.1	1.86	1.6	3.21
July.	August.	Sept.	Oct.	Nov.	Dec.
3.58	2.72	3.11	2.94	2.85	3.12

These observations give the average temperature of the year at Bristol, in the south of our district, 50°; and at Cheltenham, beyond the north of it, 49° 1.

The temperature of Chalford springs, occurring in the valley of that name, three miles east of Stroud, which are the largest springs in the county, does not vary throughout the year, and may be taken as the average annual temperature of the place; it is 49° 8.

The temperature of a considerable spring, near Hilsley, was, in the month of August, 50°. This, too, may probably with accuracy be taken as the temperature of

the place. Neither of these, however, occur on the table land, the annual temperature of which is, probably, above 3° degrees less than either.—*M. S.*

ON LIQUID MANURE.—No. III.

(*Concluded from p. 467.*)

In pursuing the above subject, for the purpose of ascertaining the cheapest and most economical method of converting the ammonia generated in urine by putrefaction into a fixed salt, we next come to *Sulphuric Acid*. This acid, from the large quantity which is used in our arts and manufactures, is now produced at a much cheaper rate than formerly. It offers the most certain, if not quite the cheapest mode of fixing the ammonia contained in putrid urine by at once entering into chemical combination with it. When sulphate of iron, sulphate of lime, or any of the soluble salts are used for this purpose, a double decomposition occurs: the two constituents of the substance used are separated, and enter into new combinations with the ammonia; but before this change can take place, the two substances which are intended to react on each other—*i. e.*, before the acid of the one can combine with the alkali (ammonia) of the other, both must be in solution; and when the substance used to fix the ammonia is sparingly soluble, as is the case with gypsum, much care and time is necessary effectually to accomplish this object. But when the acid itself is used, no such inconvenience takes place; the acid at once combines with the ammonia, and forms a sulphate of ammonia, while carbonic acid escapes with effervescence. In using sulphuric acid in liquid manure, there are several advantages obtained over that of gypsum, or sulphate of iron, since in the first place no deposit takes place in the tank, which requires it to be occasionally emptied; and if a slight excess of acid be added, no injurious action is exerted by it on the plants, should it in this state be added to the soil; indeed, a slight excess of acid in the tank would be more beneficial than otherwise, since urine contains no inconsiderable portion of phosphate of lime and magnesia; and an excess of acid would convert this into a superphosphate, which is more soluble, and, we have every reason to believe, far more efficacious than phosphate of lime or bone-earth; for by the use of a small quantity of bones dissolved in sulphuric acid, by which a soluble superphosphate of lime is formed, we are enabled to produce as large a crop of Turnips as by the use of many times the weight of bones without the acid.* When sulphuric acid is used in liquid manure, it may be added in small quantities as long as any effervescence occurs, stirring the liquid after each addition, and waiting until the effervescence has subsided before any fresh addition of acid be made; and it is advisable that this should be done at intervals of ten days or a fortnight where convenient. In purchasing sulphuric acid, care should be taken to ascertain that it is of full strength, namely, of 1·85 specific gravity; and, as its strength is in direct proportion to its specific gravity, this is a good criterion by which the purchaser can protect himself against imposition. The following is a mode by which an inexperienced person may ascertain if it be undiluted:—Fill an imperial pint with water, and place it in the scales, having first balanced, or ascertained the weight of the empty cup: the water should weigh 20 ounces; remove the cup, and pour away the water, then fill it with the acid the strength of which it is required to ascertain, and again weigh it; if it weighs about 17 ounces more than the pint of water, the acid is of ordinary commercial strength, but if much less, it has been in all probability diluted.

Common Salt has been strongly recommended to fix the ammonia in urine, since it was thought to possess the double advantage of not only forming a muriate of ammonia, by the acid contained in the salt combining with the ammonia in the urine, but because the carbonate of soda which would also have been found would act as a beneficial manure, supplying plants with an alkali; and, if this theory had been correct, salt would certainly have possessed great claims on the farmer's attention; but unfortunately the decomposition which goes on when concentrated solutions of common salt and carbonate of ammonia are mixed together, takes place on too limited an extent in diluted solutions, as we meet with it in urine, to be of any service to the farmer. When two concentrated solutions of salt and carbonate of ammonia are mixed, a quantity of carbonate of soda and muriate of ammonia are formed; the carbonate of soda being comparatively insoluble in a solution of muriate of ammonia, it is deposited in the vessel, and may be separated by a filter. But if this mixture be largely diluted with water, and the carbonate of soda redissolved, the elements again arrange themselves in their original form, namely, carbonate of ammonia and salt. Strange as this may appear to those unacquainted with chemistry, it is nevertheless the case that when strong solutions of the above salts are mixed, a decomposition takes place, which does not occur, or at least very partially, in less concentrated solutions; and as putrid urine is a weak solution of ammonia, salt undergoes little or no decomposition when mixed with it. Hence the ammonia does not become fixed, neither is carbonate of soda formed. *Muriatic acid*, spirits of salts, or hydrochloric acid, may be substituted for sulphuric acid to fix the ammonia in urine. It is, like sulphuric acid, extensively used in the manufactures of this country, and may now be purchased of the manufacturers at three farthings per pound, when taken in quantities. Like sulphuric acid it combines at once with the ammonia, forming muriate of ammonia; it leaves no deposit in the tank, and may be used in the same way as the sulphuric. In conclusion I have inserted the following table, which shows the ingredients used to fix ammonia, the quantity of each required to form 1 cwt. of sulphate or muriate of ammonia, the cost, and the quantity of ammonia fixed.

Substance used.	Weight in lbs. required.	Cost.	Ammonia fixed in lbs.	Salt of ammonia produced. lbs.
		s. d.		
Unburnt Gypsum	148	3 6	30	112 of sulphate
Burnt ditto. . .	118	—	30	112 ,,
Sulphate of Iron .	224	3 6	30	112 ,,
Sulphuric acid .	84	7 0	30	112 ,,
Muriatic acid . .	80	5 0	35	112 of muriate of ammonia.

N.B.—The cost is calculated from the market price of each article.—*Alfred Gyde, Painswick.*

ON ROTATIONS OF CROPS.

SEEING that you invite your readers to communicate the results of their experience or observation, particularly in matters which intimately concern the horticultural and agricultural communities, I beg to offer you a slight sketch of the different rotations of cropping practised on the model farm at Glasnevin, near Dublin, which is under the Commissioners of National Education for Ireland, and superintended by that intelligent agriculturist, Mr. T. Skilling. A great deal is said now-a-days about the rotation of crops, and very justly so; yet upon the whole how few are there that put a good system of rotation into practice. If this communication be the means of imparting the smallest amount of information on so interesting a subject, the writer has his reward.

This farm consists of about 52½ statute acres, and is composed partly of a deep loam and partly of a light soil; it is worked by 12 young men, with the assistance of two horses, each boy giving six hours work per day—the remaining part of their time is devoted to agricultural study, of such subjects as chemistry, botany, animal and vegetable physiology, &c. The farm-house, gardens, barns, and cattle-sheds, &c., occupy between three and four acres; the remaining 49 are divided into two rotations of four and five crops respectively. The four-crop rotation consists of 19 acres laid down in fields of 4 acres 3 rods each. The five crop rotation consists of 30 acres, divided into fields of six acres each. The reason why it is laid down in two rotations is to show the pupils the practical working of both systems; were it not for that, the whole 49 acres would be laid down under the five-crop rotation. The number of stock usually kept on the produce of the farm is 20 cows, 2 horses, and from 15 to 20 pigs; the cows are fed during the winter six months on Turnips, Mangold Wurzel, Potatoes, Hay, Straw, &c. The produce of the first two—Turnips and Mangold Wurzel—averages from 35 to 40 tons per acre, say 38 tons; each cow is allowed, with Hay and Straw, the growth of one rod of Mangold Wurzel, Turnips, &c. Suppose an acre produce 38 tons, 1 rod will yield 9 tons 10 cwt., which being reduced to pounds, will amount to 21,280; this again divided by 190 days, which is rather more than six months, will leave 112 lbs. for each cow per day, which is a large allowance for ordinary sized cows.

The amount of crops raised on the four-crop rotation is as follows:—In field No. 1 (see table No. 2).—Mangold Wurzel, Turnips, &c., 4 acres 3 roods. No. 2.—Oats, 4 acres 3 roods. No. 3.—Same quantity under artificial Grasses, such as Italian Rye Grass, perennial Rye do., and Clover. No. 4.—Do. of Wheat.

The crops on five-crop rotation are as follows:—No. 1.—Potatoes, Turnips, Mangold Wurzel, &c., 6 acres. No. 2.—Oats, 6 acres. No. 3.—Grass pasture, 6 acres, a portion of which is reserved for Hay. No. 4.—Consists of Italian Rye Grass, perennial do., and Clover, which is cut three times during the summer and autumn months for the support of the stock; a great portion of the last crop is made into Hay, for the support of the cattle during the winter months. No. 5 contains the same quantity of land, which is under Wheat or Barley. The total amount of crops raised on the farm is as follows:—Oats, 10 acres 3 roods; Wheat, do. do.; Potatoes, do. do.; cutting Grass, do. do.; Grass pasture, 6 acres; grand total, 49 acres. The produce of 20½ acres of Corn is sold, the remaining 28½ is consumed on the farm. Each cow is calculated to give 8 quarts of milk on an average daily, which, sold in the market at 2*d.* per quart is, for one cow, 1*s.* 4*d.* per day; per year, 24*l.* 6*s.* 8*d.*; or, for 20 cows for one year, 486*l.* 13*s.* 4*d.* The cows are kept from two to three years, and then beginning to go off milk, are fattened and sold, their places being always supplied by others in full milk.

I ought here to mention that the cows are, strictly speaking, house-fed summer and winter, except two hours each day during the summer months they are allowed to exercise on a portion of the Grass pasture. By this method the greatest possible quantity of manure is collected, which is the great support of the large and luxuriant crops, of Wheat, Oats, Turnips, Grass, &c., The tables Nos. 1, 4, and 5, are sent merely with the view of showing other rotations which might be advantageously used, particularly Nos. 4 and 5, on a larger scale and different soils. A good deal more could be said on this subject, but perhaps enough for the present.—*B. M., formerly a Pupil in the above Establishment.*

No. I.—*The Three-Crop Shift* is the best adapted for small farms near a market town, because you can keep more cattle on the same quantity of land than on any other rotation, because there are two green crops and one grain crop. It is as follows:—

	1st year.	2d year.	3d year.
1st yr.	Potatoes and Turnips	Wheat or Barley sown down with Grass seeds	Cutting Grass
2d yr.	Wheat, Barley, &c. with Grass seeds	Cutting Grass	Potatoes, Turnips, &c.
3d yr.	Cutting Grass	Potatoes and Turnips	Wheat and Barley with Grass seeds
4th yr.	Same as first		

No. II.—*The Four-Crop Shift* is best suited to strong heavy soil that is able to bear cultivation; it is very beneficial to the farmer in localities where it can be followed; it is termed alternate husbandry:—

1st year: Potatoes and Turnips. 2nd year: Wheat and Grasses. 3rd year: Cutting Grass. 4th year: Oats. 5th year: Same as first.

No. III.—*Fifth Rotation, or Five-Crop Shift*, is best suited to light soils; it is chiefly followed on the light soils of Scotland; it is a good rotation for raising food for cattle; it has three green and two grain crops; they are as follows:—

1st year: Potatoes and Turnips. 2nd year: Wheat, Barley, and Grass. 3rd year: Cutting Grass. 4th year: Grass pasture. 5th year: Oats. 6th year: same as first.

No. IV.—*The Six-Crop Grass Shift*; its crops are only fit for light, hill, or peat lands. It is well adapted for rearing young cattle or sheep.

1st year: Potatoes or Turnips. 2nd year: Barley or Oats, with Grass seeds. 3rd year: Cutting Grass. 4th year: Grass (second year). 5th year: Grass (third year). 6th year: Oats. 7th year: same as first.

No. V.—*The Six-Crop Bean Shift.* This rotation answers well on heavy clay soils; it is as follows:—

1st year: Potatoes and Turnips. 2nd year: Wheat and Grass seeds. 3d year: Cutting Grass. 4th year: Oats. 5th year: Beans. 6th year: Wheat. 7th year: same as first.

ON THE APPLICATION OF MANURES.

A PLANT has been defined as a compound organic body, deriving nourishment from the soil in which it grows.

This definition appears to have been generally admitted, and has been almost universally acted upon, by depositing in the ground such matters as are thought to furnish this nourishment to the roots, while a power, stimulated by light and heat, elaborating the atmospheric air and the sap, has been supposed to reside in the leaves. Some few—Tull and his disciples—have disputed the utility of so depositing these matters; they proposed, by hoeing the ground, and such like operations on the surface of the soil, to promote its disintegration, and the admission into it of the atmospheric air, in order to supply the roots with gases; and these seem, in a great measure, to be the views of Liebig. Lord Kames and others, again, have contended, and, by some apparently conclusive experiments, have attempted to prove that water is the sole nutriment of plants; but—which seems to have escaped the observations of all—may it not be supposed that the matters thus deposited in the soil, instead of supplying plants with nourishment through their roots, may really so supply them through their leaves and the greener parts of their stems?

When we look at "one of the giants of the vegetable world," stretching far, wide, and deep his vast roots into the bowels of the earth, we must feel convinced that his first and most obvious purpose is so to fix himself as to enable him to brave the storm; his second, to obtain from the soil the means of growth and of prolonging his existence. What does he seek? He plunges his roots deep in the soil: does he do this only to keep hold of it? Does he not do it also to seek food? And what food? The decaying animal and vegetable matters lie near the surface; the action of the atmospheric air, and the heat of the solar rays, do not penetrate the regions he traverses. It is water which he searches after; and this, say some, is the sole food of plants, elaborated in their leaves—this, they say, is all that it is necessary to supply them with. To the experiments made to prove this hypothesis, in which distilled water has been alone supplied to plants set in ground glass, cotton, sand, &c., it has been objected, with much truth, that "these experiments are always performed in or very near houses, where the air is not so pure as in the open fields, and consequently where they have an opportunity of receiving as much nourishment from the air as may compensate for the want of what they would have derived from the earth, if planted on a rich soil. Here, then, is an admission by those who would impugn the evidence of these experiments, and by the advocates for enriching the soil to feed the roots, that plants may be nourished from the air filled with effluviæ from the habitations of man. Can it be denied that they may be equally fed by effluviæ in the open fields, from the decaying animal and vegetable matters in the soil? It may be said that ammonia is absorbed by the water in which the roots are placed, but it is more probable it is sucked in by the leaves; the contrary opinion has tended more to check the progress of the wide-row system than all the prejudices of ignorance. "We know," says Liebig, "that the functions of the leaves, and other green parts of plants, is to absorb carbonic acid, and, with the aid of light and moisture, to appropriate its carbon."

* In adding sulphuric acid and water to bone-dust (phosphate of lime), the sulphuric acid combines with part of the lime, forming sulphate of lime; while the phosphoric acid which is left attaches itself to the remaining portion of undecomposed bone, and forms with it a superphosphate of lime, or bone-earth with excess of phosphoric acid, which is soluble in the mixture. Hence, we have a mixture of sulphate of lime and superphosphate of lime. May not the increase of crop from the use of such a mixture be partly attributable to the sulphate of lime? and would not a portion of gypsum, used with bones, increase the crop, by placing within the reach of the roots of the Turnip a substance which cannot fail to form part of its inorganic food? since it is known to contain lime (25 tons of Turnips containing about 140 lbs. of lime) as well as sulphur, both of which the sulphate of lime would yield to the crop.

Sir H. Davy and others have justly objected to naked fallows, that they facilitate the escape of nutritious effluvia from the soil, when there are no plants to absorb them; and that, if nitrous salts are produced in hot weather from exposure of soils containing vegetable and animal remains, it is probably at the expense of ammonia; and this is not denied by the advocates of summer-fallows. In hoeing between the rows of fallow crops, the objects contemplated appear to be the loosening of the soil. Liebig says—"By loosening the soil which surrounds young plants, we favour the access of air and the formation of carbonic acid"—the destruction of weeds, and the moulding up of the plants, with the intent of benefiting them. The benefits aimed at by loosening the soil are the admission of the atmospheric air into the soil, there to operate on animal and vegetable matters in the earth for supplying the roots with food. In the words of Liebig, "The carbonic acid, which protects the undecayed humus from further change, is absorbed and taken away by the fine fibres of the roots, and by the roots themselves; this is replaced by the atmospheric air, by which process the decay is renewed, and a fresh portion of carbonic acid formed." But in the widest rows, and with the horse-hoe and plough, the soil is not stirred to a depth exceeding six inches, while the finer fibres of the roots of most plants, to which this deep hoeing is applied, reach certainly very far beyond this depth; and it is the extremities of these fibres that are the mouths of the roots. I admit that some of the roots shoot laterally some of their branches, probably still to seek moisture; but broad-cast Wheat, and Wheat sown in rows rarely exceeding nine inches asunder, are rolled, harrowed, and hoed with the same object, where merely the surface can be bruised and torn up, while the Wheat seed is sown from four to six inches deep, the roots extending to a much greater depth, and the finer fibres probably a foot or two below the surface, to a depth, indeed, to which we cannot suppose, even under the most favourable circumstances—those of fresh sown ground—the influence of the atmospheric air can penetrate for the purposes of vegetation, for few seeds will germinate much below six inches. The advantages of destroying weeds cannot be disputed, but the benefit of moulding up plants is very questionable: it was never practised or recommended by Mr. Coke (Lord Leicester), of Norfolk, for white crops: to Turnips it is not considered beneficial; to Mangold Wurzel injurious; and I can myself vouch that, for Potatoes (to which roots it is generally considered most applicable), it is useless, except in a final hoeing, to allow a freer passage of air along the rows.—*T. M. G., Revenue Police, Granard, Ireland.*

(To be continued.)

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Tillage Operations.—East Lothian has been long noted for the comparative excellence of its tillage-farming; in no district, perhaps, is rural labour more skilfully executed. As I have already stated, I am by no means desirous of representing the system of farming pursued in this county as the most judicious in every respect that could be devised; much less am I anxious of holding it up as a perfect model of rural economy, for the imitation and guidance of all readers of the *Gazette*. Whether the East Lothian system of farming is superior or inferior to that pursued in some of the most improved districts in England, I am unable to say. It may be proper to observe that my remarks upon the agriculture of this county apply solely to its average character, and not to what is practised only by a few more advanced or enterprising than their neighbours. There are, undoubtedly, many examples of unskilful and slovenly management to be met with in some localities.

The following, among other circumstances, have obviously contributed, to a considerable extent, in bringing about an improved mode of tillage in this county, viz.: the extensive practice of thorough-draining, the invention and employment of efficient implements and machines for executing and economising rural labour, the nature of the soil itself, and the manner of hiring and general management of farm servants; to these, of course, is to be added the security for the outlay of capital, which is afforded by the lease. The advantages arising to the tillage farmers of this county from the complete drainage of their land, and the use of effective implements, are too numerous and apparent to require any elucidation here. Even after being thoroughly drained, the strong stubborn nature of the greater part of the soil renders it, in unfavourable seasons, peculiarly difficult, expensive, and precarious to work to any degree of perfection; and this disagreeable quality of the soil has undoubtedly contributed very much towards the general adoption of improved cultivation, as it compels the anxious and industrious farmer to resort to every expedient, and to try every mode of management which practical judgment—often the result of dear-bought experience—could devise. Nor must the admirable manner of hiring and managing farm servants, long successfully pursued in this county, be overlooked in enumerating some of the leading circumstances which have conduced to its improved cultivation. By far the greater part of the regular farm-labour is performed by married servants, provincially termed hinds. They occupy comfortable houses provided for them by the farmer, and which are always situated near the farm-steading. They are hired by the year, and paid partly in money, and partly in the produce of the farm, as shall be more particularly detailed in a subsequent article. The advantages arising to both master and servant from this system, are many and obvious. The hind, from his permanency of employment, naturally acquires an interest in the prosperity of the farm, has usually an anxiety to perform with care his own assigned duties, and from being chiefly confined to one sort of work, has evidently a better chance of becoming thoroughly a master of it.

Premising these general remarks, I shall now proceed to describe the manner of performing the principal tillage operations, as they are at present practised on the generality of farms in this county, beginning with the most important and indispensable of them all, viz.:—

Ploughing.—It may be necessary to explain some of the technical expressions connected with this subject, employed in this and other parts of Scotland. Land once formed into ridges, is subsequently ploughed by either of the following methods, viz., 1. The ridges may be split out in such a way that the space formerly occupied by the crown of the old ridge becomes the furrow of the new. This operation is technically called *crown-and-furrow* ploughing. 2. Two ridges may be ploughed together, by which means the form of the old ridges, and the situation of the intermediate furrows, are preserved unaltered. This mode of ploughing is termed *casting*. 3. The ridges may be *gathered*, which is effected by beginning at the *crown* or centre of the ridge, and ploughing all the furrow-slices towards it. By this means an increased elevation or curvature is given to the ridge. 4. The last operation may be reversed by commencing at the furrows without ploughing into them, and concluding at the crown, which then becomes an *open* furrow. This process is called *clearing*, the ridges being, when this method of ploughing is adopted, divided or cloven into halves. Each of these modes of ploughing shall be afterwards more minutely described.

Feering, or *feiring*, is a Scotch term, referring to the opening of the first furrow-slices in ploughing a piece of ground, or the process of marking off or *striking* the furrows which regulate the after ploughing of land into ridges. Where the ploughing of a ridge or other piece of ground terminates, is called an *open furrow*; thus, when the crown-and-furrow mode of ploughing is pursued, every furrow is an open one; but in the case of the ridges being cast only every fourth, one becomes an *open* furrow, the others are termed *close* furrows. The last furrow-slice in ploughing a ridge or other piece of land is generally named the *hinting* furrow. When ridges are ploughed, by turning the horses at the headlands to the right about, as is sometimes done in the case of gathering, they are said to be *hupped in*; and when ploughed by turning from right to left, as in cleaving, the ridges are said to be *winded out*. The most of these technical expressions will, doubtless, appear rather strange to southern readers, and may probably sound somewhat harshly in their ears, but they are well understood in all parts of this country. Their use, however improper in a Paper like the *Gazette*, is almost unavoidable in describing the different methods of performing the important operation to which they refer. I shall endeavour, however, to employ only those local terms which cannot be dispensed with, without occasioning some prolixity of detail. One of the ploughmen, generally the steadiest and most skilful, on every farm is appointed to the rank of *foreman*, a station next in point of trust to that of the steward or *grieve*. The usual duties of the foreman are to feer or mark off the land into ridges, both for himself and for the other ploughmen, to conduct the process of ploughing and other tillage operations, and to regulate the time for stopping from and recommencing work. He is also generally required to stack and sow corn, for which he commonly receives two bushels of Wheat yearly, in addition to the ordinary wages of a ploughman.—*T. Sullivan.*

AGRICULTURAL IMPROVEMENTS.

Having in my three former letters disposed of the details of my farming operations, I will now proceed to consider,

First, The imperative necessity of agricultural improvements in a national point of view, and how those improvements can be most readily effected.

Secondly, The defects in the present system of farm valuations, and evils resulting therefrom to landlord, tenant, and country.

Thirdly, The relation of landlord and tenant to each other in a pecuniary point of view; their identity of interest, and the importance of long leases, with Corn-rents.

Fourthly, Suggestions for rendering the Royal Agricultural Society a standard and model of agricultural improvement in every essential point.

Lastly, Popular but prevalent errors as regards agriculture, with a few general remarks.

The existence of a superfluous capital, with a superabundant unemployed population, is a dangerous anomaly, threatening, in its continuance, ultimate destruction to our nation. Luxury for the wealthy few, and poverty for the willing, but unemployed many, must produce discontent, anarchy, and ruin. It is an alarming fact, that much of our income is derived from the capital we lend to foreign countries; whilst, in our own, we dole out grudgingly, in rates and in charities, a tithe of what ought to be the just and well-earned wage of the industrious but unemployed labourer.

Ask the majority of your independent friends whence they derive their income? The widow will tell you, "My money is making a road, cutting a canal, or building a town in America." The orphan will say, "Mine is supporting a civil war in Spain or South America, or growing corn in Russia for the London market." The capitalist will report his strong-box full of bonds—Chilian, Columbian, Peruvian, Mexican, French, Spanish, Dutch, Portuguese, Russian, Austrian, Prussian, and Neapolitan (some of which, by-the-by, pay neither interest nor principal); but neither the widow, the orphan, or the capitalist will tell you their money is profitably and delightfully engaged in growing food for themselves and their families—in providing employment and profit for their fellow-countrymen, of every grade, from the labourer to the merchant. No! Agriculture has had as yet no charms for the capitalist or speculator. The one lends his money to strengthen foreign competition in agriculture, commerce, and manufactures; the other sows uselessly and prejudicially more seed than the total annual amount of our Wheat importation—the extra quantity sown actually diminishing the produce to a similar extent; yet all this takes place whilst we are complaining of superabundant capital and population, as if an industrious population could be too great. My opinion is, the more numerous we are the more prosperous we shall be, for we live by one another. The denser the population the greater our power and our trade, provided we keep our capital at home and at work amongst ourselves.

To ship off our labourers and our money is nothing less than suicide. It is giving away, economically and politically, the sinews of our strength; and I call upon every man who has the welfare of his country at heart to put a stop to it. How is this to be done? I answer, Easily; and point to my operations at Tiptree Hall Farm, as a solution of the difficulty. If every capitalist expends, as I have done, 46*l.* sterling money in improving each acre of poor and indifferent land, the sum total required would be many hundred millions. I need hardly point to the magical effect of this expenditure on our trade, commerce, and manufactures. Every individual in this country would feel it. It is too grand and delightful a prospect to hope to realise. There is too large a mass of miscalculation, ignorance, prejudice, pride, and long custom to be removed. Facts and results will scarcely do it; but reason and truth must prevail at last: and I look forward with hope that the patriotic, the intelligent, and the wealthy will exercise their influence, by example and precept, to procure so desirable a result. Agriculture is our sheet-anchor; to that we must look for employment and for profit: it is a vast field for enterprise: it is our vital strength as a nation; and our pride of country alone should stimulate us to be independent of foreigners for the supply of our daily bread—the staff of our lives.

In considering how these improvements can be most readily effected, it is quite clear that individuals generally have seldom the means, the ability, or the inclination to carry out a perfect system of agricultural improvement: it must be done by companies of associated capitalists, the same as our railways and other great undertakings. I will venture to assert from experience, that there is not, in agricultural undertakings, one tithe of the difficulty or uncertainty that attended railway operations. Rival companies will be beneficial to the public by the protection of competition. General rules, however, on fundamental principles, must be obtained by sanction of Act of Parliament; and I apprehend an examination of competent authorities would lead to a table of laws adapted to the security and profit of the shareholders, the benefit of the landowner, and the welfare of the tenant. Mortgagers might transfer their mortgages to the company, with full authority to carry out necessary improvements, on condition of receiving from the company all benefits over and above five per cent. interest for the company's capital. Should the landowner desire a sale, the company would have the opportunity of purchasing outright by public competition; or the landlord might have the power of redeeming his property, on paying the company principal and interest up to a period of sufficient notice. In all cases where there is not an absolute sale, landlords should have the power of redeeming their property or transferring it to another company, under equitable arrangements to both parties. The variations in rents and prices of corn would be no greater, on an average, than the fluctuations in railway or other shares.

As to the fear of companies engrossing land, the same objection cannot apply to them as to charities. Shareholders invest for profit, and rivalry will necessarily prevent oppression. What tenant would not rather trust to fair competition under a company than to individual favour, cupidity, or caprice, to say nothing of the uncertainty of individual life? Landlords would also benefit. Frequently now (I know several cases) a landlord, without agricultural knowledge, is prevailed upon, by a designing or an incompetent tenant, who shows an annual statement of heavy losses, to reduce his rent, till he receives but two per cent. for his money. I proceed to consider—*The propriety of valuing improvements; the defects in the present system of valuation, and its evil results to the landlord, the tenant, and the nation.*

At present a bad farmer is almost sure to get a new lease (for who is anxious to take it after him?) whilst a thorough good one is almost as certain to be turned out, or have his rent raised—the landlord being generally ready to avail himself of those improvements which a wise farmer is compelled to make for a profitable return. These improvements are *bonâ fide* his property, and ought to be legally as much so as the coat on his back; and it is a scandal and disgrace that they are not valued to the incoming tenant.

Let us see, in fact, how it acts on the landlord. I shall prove clearly he is a loser by it ultimately.

The outgoing tenant is obliged in self-defence to starve the land and injure his crops the last four years of his lease, whilst it takes the incoming tenant another four years to repair the damage done by his predecessor; so that between the two there is during eight years less

labour and capital employed, less food grown, less profit made, and an increase in the poor's rate, without any corresponding benefit to the landlord. In nine cases out of ten an improving tenant resists being charged a large interest, in the shape of increased rent, on his own capital. He makes way for a miscalculating bad farmer, who ruins the land, ruins himself, and ultimately the landlord is obliged to put up with a small rent—not, however, till all parties have been put to considerable regret, inconvenience, and expense, arising from exchange of residence, to say nothing of expensive sales, valuations, and leases, a non-acquaintance with the pecuniaries of a new farm, and the breaking up of many friendly and relative ties, formed during a local residence.—*I. J. Mechi, 4, Leadenhall-street.*

To be continued

ON MINERAL AND INORGANIC MANURES.
— No. XXII.

By Professor Charles Sprengel.

Continued from page 440.

Sand.—Sand, as everybody knows, is an aggregation of loose small grains. Generally it is believed that the grains consist merely of quartz or silex, but by closer examination it is found that many grains of felspar, mica, iron ore, silicates of potash, soda and lime, oxide of iron, &c., are amongst the main mass. If, therefore, sand is brought on fields, we must not believe that it merely improves them mechanically; on the contrary, we may assume that it furnishes them with sources of vegetable nutriment. Because, although the mineral substances of which it is composed (such as they are) are not soluble in water, still they are decomposed by the humic acid, and gradually changed into food of plants. For marshy, or very humic soils, even the purest is a manure, as it supplies them with silica, in which they are mostly deficient. As the value of sand, as a manuring substance, consists in the quantity of those of its mineral component parts which are fit for becoming the food of plants, obviously that is to be chosen which is richest in lime, soda, potash, and magnesia silicates; this, however, can be only ascertained by chemical analysis, which has hitherto been entirely neglected. Sand, moreover, used as manure, ought to be very fine, as it will then present to the humic and carbonic acids, which have to decompose its silicates, a greater scope for contact. A clayey soil, nevertheless, which has to be loosened and improved by sand, requires one of coarse grains. Although sand, generally speaking, is only used for the improvement of clayey or very humic soils, it may be also useful for chalky soils, as this sort of soil is always deficient in that quantity of silica which is required for the food of plants, and especially for that of the cerealia.

On stiff clayey soils, which require an improved texture, a sand is to be used which contains many grains of lime, as those will loosen the soil even better than grains of quartz. On the sea-coast that sort of sand, therefore, which is thrown out by the waves, is used with much success for the improving of clayey fields, as it always contains fragments of shells, rich in carbonate of lime. It is generally first used as litter, and then carried (mixed with excrements) to the clayey fields, which, if the process is often repeated, will not only be improved physically in the highest degree, but also become very fertile. In the manuring of clayey soils with sand, the toughness of the former will always make a thorough mixture with the sand very difficult, at least by manual labour; it will be therefore best to leave it to Nature. The coarse-grained sand may be spread over a field to the thickness of a quarter to half an inch, at the time when it is used as pasture, as in this case it will not only be trodden in by the cattle, but will be also conveyed downwards into the small crevices which are to be found in a dried up clayey soil*—an operation which will be also assisted by the rain-water. The first (subsequent) ploughing is done very shallow, and the first crop should be Oats. After the lapse of a few years, or when the field is used as a pasture, sand is again spread to the above thickness, which, in fact, is repeated until the clayey soil is changed into a loamy one. The same process is resorted to if sand is used for the improving of moors, peat and marshy soils, be it used as a pasture, meadow, or as arable land; but here the thickness of the sand strata may be 1 to 1½ inches. It will improve the moor, if it be only by compressing it by its weight, and it will bring the organic matters to speedier decomposition.

I may state here that the proportionally bad growth of crops on soils very rich in humus depends (besides some other reasons) on their roots not finding enough oxygen in the soil; which substance, as it penetrates gradually into the ground is seized by the carbon of the humus, and then cannot be used as food of the roots; for which, nevertheless, it is absolutely indispensable. The following experiment will corroborate my assertion:—I selected a light loamy soil, containing 4 per cent. humus, and a considerable amount of particles of iron. Part of this field had borne for three years Clover, and other parts alternately Oats and Vetches; both parts were dug in together on the 31st of April to a depth of 6 inches, and without being manured at all. I planted them both at once with Oats. On that part where the Vetches had ripened the year before, the Oats grew up in three days, whilst on that which bore the Red Clover the Oats did not come out of the ground till after 8 days. One might have supposed that the Clover-roots should have come up to the Vetch Oats, on account of the better nourishment at its command; but this was not the case. It seems quite easy, and is natural to give this as the

* It will not be advisedly buried by the worms.

ripening period came on. This phenomenon may be thus explained:—The soil which, on the previous year, had borne Vetches, was so loose that the atmospheric oxygen had constant free access to it; and as it therefore continually served as well for the oxidation of the humus as for that of the protoxide of iron, the Oats found at once as much as they required for speedy germination, and subsequent luxuriant growth. The soil, on the other hand, which had been Clover during three years, did not afford during this period any free access to the oxygen; and when it was at length dug up, the humus and the protoxide of iron (perhaps also the rotting Clover-stubble) took up so much of oxygen—of which they had been so long deprived—that none remained for the roots of the Oats; and thus accordingly crops are prevented from succeeding on soils very rich in humus, to that extent which other circumstances might warrant us to expect. Humic soils will, it is true, absorb more oxygen than any other soil; but they will not keep it in a free state, as it is immediately used for the formation of carbonic and humic acids. Thence it may be deduced, that a soil which contains much undecomposed humus will be much improved if a part of the humus is destroyed, or if any large quantity of a substance be conveyed thereon, which will tend to diminish the amount of it. The former is done by burning and converting it into ashes; the latter, by covering it with a thick layer of sand, common earth, or loam. It is long since both these plans have been adopted with the best effect, and although it is beneficial in many other respects, it is chiefly so in this that the less quantity of humus will then not deprive the roots of the plants of oxygen. If a very moory meadow, or one which has been previously drained, be supplied with much sand, say to the height of 4 to 5 inches, the sour Grasses and Mosses will be suppressed; and if then Oats with Clover and Grasses are sown, they will find in the old rotting Grass such a source of rich nourishment, that they will grow very luxuriantly, at least for some time. More on this subject is found in my work on Cultivation.

If there are fields very rich in humus, where Rye is grown, sand a quarter or half an inch thick may also be strewed to great advantage in winter over the frozen soil; it will then also prevent the freezing of the crops during the spring. It has been stated before that sand may be used in stables as litter, and the dung thus obtained may be used as a manure on moors.

As sand is always used in large quantities, its effects are lasting, unless it sinks in marshy soil so deep as to be altogether beyond the reach of the roots; in this case it will even act no longer physically, so that the spreading of it must be repeated. Clayey and chalky soils, on the other hand, will be constantly improved by large quantities of sand, as the water cannot then carry off any of it.

HISTORY AND CULTIVATION OF WHEAT.

In what country Wheat is indigenous is not easily ascertained; all opinions must now rest merely upon conjecture. We read of its cultivation in the earliest records of history.

The migration of seeds and plants has been assisted by the sea, the wind, and granivorous birds, and quadrupeds, as well as by the hand of man, so that it is impossible in all countries to distinguish the indigenous from the foreign.

Wheat is now found growing in a great variety of climates—from the north of Africa to the south of Sweden—but it is more particularly in the temperate zones that it is cultivated with any success. In Norway, Sweden, and Denmark, its cultivation and consumption is very limited; if we turn our course eastward we find it cultivated in abundance, and forming the principal nourishment of human food; if again we proceed still further south, till we arrive within the tropics, we find that the indigenous plants, as Rice, Millet, Maize, &c., are more extensively cultivated as an article of food and commerce, Wheat being cultivated only occasionally. Its character appears also to accommodate itself to circumstances. Sir Joseph Banks, in one of his many papers addressed to the Horticultural Society, mentions in 1805 having received some seeds from a lady, among which was a packet labelled "Hill Wheat," the grains of which were not larger than the grains of our common Grasses, but when magnified exactly resembled Wheat. These grains he carefully sowed in his garden, and was much surprised on observing as the produce a good crop of spring Wheat, the grains being of the ordinary size! he made inquiries as to the history of the seed, which proved frustrate, all that could be learnt was, that they had been received from India.

It cannot be denied that Wheat followed in the train of the conquerors of foreign lands, as we find is related in the history of Cortez, however as he was, that when exhibiting Mexico to the Spanish court, he wrote thus to the King of Spain:—"I beseech your Majesty to give orders that no vessel sails from Spain without a certain quantity of grain and plants; we shall not prosper here as we have done in the islands where we have neglected cultivation and destroyed the inhabitants; a sad example ought to teach us otherwise." We may naturally draw from this, the introduction into our own island by the Romans, who on their gaining a footing in Britain (44 B.C.) found the British tribes living exactly as the Indians do now, upon animals caught in hunting, and on roots and plants indigenous to the island, grain being unknown, except among the coasts. Whether the order of Cortez was obeyed or not we have no authentic account, but the cultivation of the Wheat now known in Mexico is said to be the produce of a few grains, some

a negro slave of Cortez accidentally found in 1530 amongst some Rice; these the careful negro preserved and cultivated, while, had they fallen into careless hands, they would have been lost to the country. The introduction of Wheat into Peru was the produce of a few grains carried to Lima, by the wife of Diego de Chaves; her name, and the means she took in disseminating the yearly produce of those grains amongst the Indian tenants, are gratefully recorded in history. However careful she had been in thus preserving this blessing to Peru, the general cultivation did not commence till after the introduction of Wheat into Mexico; for in the year 1561 Wheaten bread was considered as a dainty, and scarcely known in the important city of Cuzco. And so grateful were the inhabitants of Quito for the introduction into that country, by a Franciscan, that the monks of the monastery of St. Francis preserve, as a precious relic, the wide earthen vessel in which the grains first reached that country.

In Canada Wheat is cultivated in abundance, sufficient for the own population, and for exportation to the mother country, where it is received upon more advantageous terms than Wheat the produce of any part of the Continent of Europe. In the United States Wheat is cultivated, as in the temperate regions of Europe, but, from improper cultivation, it is much inferior to the produce of our own island. In the southern provinces of Brazil, Buenos Ayres, and Chili, Wheat is commonly found; and it is a principal article of cultivation at the Cape of Good Hope, yielding there a crop of fine quality, with a small proportion of bran. Wheat also flourishes in Australia and is now the object of general cultivation.

The process of making wheaten bread, similar to that used by us at the present day, was known in the east at a very early period; but we are not informed who was the discoverer, to whom we are all so much indebted. The Jews knew the art of making bread many years before the Christian era, as we are informed in Holy Writ, that they were forbidden the use of leavened bread during the Passover; and there can be no doubt but they learnt the art of making bread from the Egyptians.

Pliny informs us that the ancient Gauls and Spaniards were the first to use yeast or barm in the process of bread-making, leavened bread being used before; and it still is, in some parts of the south-east of Ireland and other countries. At Paris, about the 11th century, the bakers used yeast instead of leaven; but the facility of manufacture in 1666 declared it injurious to the health, and many years elapsed before the bakers could convince the public that bread raised by yeast was better than that fermented by leaven. Previous to the year 1440, there were no bakers' shops in London, before that date the inhabitants of Stratford were bakers for the whole city, and they sold their bread every day, except Sundays and great festivals, which was brought in carts; and they were ordered to stand—three in Cheapside, two in Cornhill, and one in Grace-church-street.

At the commencement of the last century, Wheaten bread became generally used by the labouring class in England; for we find that in 1773 it was used in the poor-houses in the southern counties. During the 16th and 17th centuries, it was only used by the higher class, and that only on particular occasions. According to Eden, in the year 1797, so small was the quantity of Wheaten bread used in Cumberland, that it was only a rich family that used a peck in the course of a year and that was used at Christmas. The usual treat for a stranger was a thick Oatcake and butter. The Author of the "Three Tracts on the Corn Trade, published at the beginning of the reign of George the Third, says, "It is certain that bread made of Wheat is become much more generally the food of the common people since 1697 than it was before that time; but it is still very far from being the food of the people in general." At that time he calculates the number of people in England and Wales to be 5,500,000, and 2,000,000 of that number used Wheaten bread.

The estimated average consumption of Wheat in the United Kingdom, at the present time is 11 bushels per annum, or 1¼ bushel per week, or nearly 3 pints quarters each day.

At the present time Wheaten bread is used more or less in all civilized countries. In Ireland, however, and some parts of Scotland, the working class live entirely upon Oatmeal and Potatoes, with milk, when it can be procured; and in severe climates, as those of Norway and Sweden, in years of scarcity, it is no uncommon occurrence to see trees stripped of their bark to make bread, the bread being made of the inner bark next the wood, first steeped in warm water to remove its astringent flavour. It is then long exposed to dry; and when dry is ground with the Oaten corn meal.—*J. M'Intosh.*

Home Correspondence.

Potatoes.—There is a great failure in the neighbourhood of all sorts of Potatoes except the early rose. One thing I have observed for many years, that wherever Potatoes have been accidentally left in the ground, no matter how severe the winter a frost, such Potatoes always have regenerated early and well; and this, I conclude, is from their not having spent themselves by throwing out shoots as they would if taken up and saved, being thoroughly ripe. Hence I prefer those tubers as seed which have not been perfectly ripened, because not being thoroughly ripe, there is the less probability of their vegetating before being planted out.—*J. F. Hennessy.*

Farm Housekeeping and Improvements.—In reading your Leading Article on the above heading of Farming, a query occurred to me, viz., "At what period of their growth

should the hoeing cease?" It is evident that a late horse-hoeing when the soil is permeated, as you describe, with the roots of the Turnip, so that "a handful of earth could not be taken up which was not full of these silken-looking fibres," must break and destroy many of these roots. Now, the question is, Is this breakage of the roots beneficial or injurious? The late Mr. Cobbett (as far as I recollect), contended that it is beneficial, and following up the principles of Tull, advised the hoeing of Indian Corn, &c. up to a very late period of their growth, asserting that the temporary check from the breaking of the minute roots is a trifling evil compared with the far greater good derived from exposing the soil to the influence of the atmosphere, and from the greater vigour soon gained by the plant when the broken roots have pushed up new subdivisions. This seems an important point in agriculture as well as horticulture, not yet satisfactorily ascertained by actual experiment. In gardening, except in the case of Peas and Potatoes (and the advantages of confining their roots chiefly to ridges is not very obvious), the practice I imagine is not to stir the earth except very superficially, as in hoeing up weeds between the crops of Cabbages, Lettuces, &c. The experiment might be easily made by letting part of a plot remain under the ordinary culture, and hoeing the remainder dug between, up to the latest period of the plants' growth; and a similar experiment might be tried as to horse-hoeing part of a field of drilled Turnips or Wheat; and I should strongly advise agriculturists and horticulturists, who have the opportunity, to institute these experiments, in order to ascertain what the facts really are.—*S.* [The question put by our Correspondent is a very important one; the evident advantage which has attended the practice on our own farm, of horse-hoeing, as long as the leaves of the Turnip plant will permit, would incline us to approve of Cobbett's answer to it. Every fibre broken sends out a dozen branches from the breakage, and thus any temporary check which the plant may receive is soon swallowed up in the increased vigour of its growth.]

Fixation of Ammonia.—In your first Number this year, I forwarded to you a statement of some interesting experiments made by Mr. Bree on the fixation of ammonia by sulphuric acid in liquid manure, and that gentleman has since added some further particulars himself. I had hoped long before this to have said something further on the subject of experimental research in agriculture, but one thing or another has so occupied my time that I have been continually prevented from turning my thoughts to a fresh communication. I hope, however, soon to resume the subject. In the mean time I wish to remind any of your readers who may have undertaken the little experiment I proposed last year to the farmers of Suffolk, that the time is drawing nigh when I hope to have their schedules returned satisfactorily filled up. By satisfactorily, I do not mean favourably to any particular result, but fairly and accurately. I have spoken with some persons who have undertaken the experiment, and they tell me they can *see* no difference between the patch manured with the addition of the gypsum, and that manured without it. But let me remind them all that Mr. Bree said he could *see* no difference in the experiment he tried, and yet he obtained a most marked difference by the scales. As yet I have only received one schedule filled up—for Turnips; and in this case the result has been decidedly in favour of the application of the gypsum. Without entering into any of the details, I will just mention what the result has been; though I must say, as I have said before, I put no faith in the results of one or two, or scarcely in a dozen such experiments. The results are estimated from the acre, from the proportions actually obtained:—

	Bushels.	tons.	cwt.	lbs.
Unmanured land . . .	480	15	7	16
Gypsumed dung . . .	640	20	2	96
Do. (only half the quantity of the manure applied) . .	520	16	5	26
Ungypsumed dung . .	560	17	1	8
Do. (gypsum added after it had rotted)	600	18	8	64

—*J. S. Henslow.*

Allotment System.—Two out of the three families, consisting of 22 persons, now living in comfort on only 13 acres of land, were paupers in the Eastbourne and Hellingly Union Houses, in 1840. They keep books for the insertion of the remarks of those who favour them by inspection; and their books contain the signatures of numerous farmers, clergymen, and members of both Houses of Parliament, confirming the truth of the statement, and the excellence of the crops they witnessed; and amongst the most recent are the signatures of the Earl of Devon and Captain Kennedy, Secretary of the Landlord and Tenant Commission, who kindly took the trouble of coming, on the 15th of June, from London, to examine, in detail, this simple plan, by which, if it were general, more might be saved in Poor-rates in England and Wales only, than the total amount of the Income Tax from the whole of the United Kingdom.—*M. A. G.*

Guano, Natural and Artificial.—I beg leave to offer the following experiments to your notice:—I selected a Grass field, intended for Hay, and divided it into two equal parts; I top-dressed the one with Potter's artificial guano, and the other with African, at the rate of 3 cwt. per acre, both being mixed with fine sand; the result, after mowing and making into Hay, was fully double in favour of the African material. I procured the one direct from Potter's manufactory, and the other out of a ship direct from Ichaboe to this port. Now, when we take into consideration the price of Potter's guano—12*l.* per ton, and the other 7*l.* 10*s.* or 8*l.*—the difference is so enormous, that I at least shall not be induced in a hurry to use any more of the former. As by experiments only, similar to the above, the public can be put on their guard against deception and imposition, I think everybody ought, in justice to their neighbours, to give publicity to any trials they may make of new articles of manure, noting carefully the comparative results.—*J. Stanley, Whitehaven.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. A WEEKLY COUNCIL was held at the Society's House in Hanover-square, on Wednesday last, the 17th of July; present—The Rt. Hon. Earl Spencer, President, in the chair; Duke of Richmond; Earl of Essex; Viscount Hill; Hon. R. H. Clive, M.P.; Hon. G. H. Cavendish, M.P.; R. Archbold, Esq., M.P.; J. Baines, Esq.; T. R. Barker, Esq.; J. R. Barker, Esq.; S. Bennett, Esq.; J. I. Briscoe, Esq.; Sir A. de C. Broke, Bt.; E. Buller, Esq., M.P.; F. Burke, Esq.; Dr. Calvert; Rev. T. Cator; Col. Challoner; F. C. Cherry, Esq.; E. Divett, Esq., M.P.; T. B. Evans, Esq.; W. Y. Freebody, Esq.; Sir J. S. Forbes, Bt.; W. F. Hobbs, Esq.; J. Kinder, Esq.; W. Miles, Esq., M.P.; E. M. Mundy, Esq.; A. Ogilvie, Esq.; E. W. W. Pendarves, Esq., M.P.; E. S. C. Pole, Esq.; Sir R. Price, Bt.; H. Price, Esq.; P. Pusey, Esq., M.P.; Prof. Sewell; W. Shaw, Esq.; R. B. Sheridan, Esq.; E. Thomas, Esq.; J. Towers, Esq.; and T. Tweed, Esq. The following new members were elected:—

Ingram, H. F. Meynell, Hodness, Rugeley, Staffs.
Platt, Henry, Priestly Farm, Hitwick, Ampthill, Beds.
Atkinson, John, Charlton, Salisbury.
Olivier, Col. H. S., Manor House, Polleme House, Devizes.
Farquharson, Henry James, Langton, Blandford, Dorset.
Biddle, Waring, Long Ham, Wimborne, Dorset.
Rayne, Robert, Flatts Farm, Bishop Auckland, Durham.
Harvey, William Francis, Purbrook Heath, Portsmouth.
Bailey, Edward, Martyrs Worthy, Winchester.
Edwards, Henry, Winchester.
Price, Charles, M.D., Brighton.
Edgell, Richard Wyatt, Milton-place, Egham, Surrey.
Baker, Major T. R., Wivley Court, Plymouth.
Cartwright, George, Lyme Regis, Dorset.
Adams, Samuel, Ware, Herts.
Brookes, William, Elmstree, Tetbury, Glouc.
Gawner, Francis, Coombe Wood, Kingston, Surrey.
Kingsford, John, Esher, Surrey.
Page, James, Merton, Surrey.
Coe, Robert, Tilney, Lynn, Norfolk.
Burness, James, 64, Cornhill, London.
Hony, Rev. W. E., Baverstock Rectory, Salisbury.
Morrice, George, Eling, Southampton.
Withers, Richard, Luzborough Farm, Romsey, Hants.
Ashhurst, John Henry, Waterstock, Oxford.

The names of 22 Candidates for election at the next meeting were then read.

DESTRUCTION OF RATS.—Dr. Ure, F.R.S., communicated, through Mr. Pusey, M.P., the following results of his experiments on the best mode of preparing phosphorus as a poison for rats:—

"In the Journal of the Royal Agricultural Society there was published, several months ago, a prescription for preparing a poison for the above purpose, by an English gentleman resident in Germany. That preparation consisted essentially of phosphorus mixed with flour and sugar. It has been tried by a friend of mine in Derbyshire, who has a most extensive farm, and found to answer the purpose well; but there is a great difficulty in preparing it, from the insolubility, and even immiscibility, of phosphorus in water, attended with no little danger of fire. The process I have found to succeed perfectly is as follows:—Melt hogs'-lard in a bottle plunged in water heated to about 150 deg. Fah.; introduce into it half-an-ounce of phosphorus for every pound of lard; then add a pint of proof-spirit, or whisky: cork the bottle firmly after its contents have been heated to 150 deg., taking it at the same time out of the water-bath, and agitate smartly till the phosphorus becomes uniformly diffused, forming a milky-looking liquid. This mixture being cooled, with occasional agitation at first, will afford a white compound of phosphorus and lard, from which the spirit spontaneously separates, and may be poured off to be used again, for none of it enters into the combination; but it merely serves to comminute the phosphorus, and to diffuse it in very fine particles through the lard. This fatty compound, on being warmed very gently, may be poured out into a mixture of Wheat-flour and sugar incorporated therewith, and then flavoured with oil of Rhodium, or not, at pleasure. The flavour may be varied with oil of aniseed, &c. This dough, being made into pellets, is to be laid in rat-holes. By its luminousness in the dark, it attracts their notice, and being agreeable to their palates and noses, it is readily eaten, and proves certainly fatal. They soon are seen issuing from their lurking places to seek for water to quench their burning thirst and bowels; and they commonly die near the water. They continue to eat it as long as it is offered to them, without being deterred by the fate of their fellows, as is known to be the case with arsenical doses. My friend in Derbyshire bought a pot of Mr. Meyer's rat-poison, and found it to be an analogous phosphoric preparation. The present mode of preparing it is the result of my own experiments, made with the view of diffusing phosphorus through a mass of flour and sugar, &c, without the risk of fire."

The paper in the Society's Journal, referred to by Dr. Ure, will be found in the third volume, page 428, and was communicated to the Society by Captain Stanley Carr, of Tüschenbeck, near Lübeck, in the duchy of Lanenburg. It may be an easy guide for those members of the Society who are desirous of following Dr. Ure's prescription, and may not have a thermometer at hand, to know that a temperature of 150° of Fahrenheit is equivalent to a degree of heat midway between that at which (according to Schübler) white-of-egg coagulates and white wax melts.

Mr. Miles, M.P., stated the success with which Captain Carr's remedy for destroying rats had been tried by himself and others in Somersetshire, and the extraordinary manner in which they came to eat it.

[The remainder of our report of the proceedings of the last and present Weekly Councils, and of the two intervening special Councils, are unavoidably postponed.]

AGRICULTURAL CHEMISTRY ASSOCIATION.

The committee of management, in their Report, read at the half-yearly general meeting of the Association in January last, announced to the subscribers that Professor Johnston had shortly before then obtained premises for a laboratory, and had engaged several experienced chemists to assist him in his duties; and they expressed a belief that when the arrangements were completed, and when it became known to members of the Association, and to the public, that they were ready to begin work, full employment would be given them. The committee will now briefly narrate what has been done by themselves and by Professor Johnston to carry into effect the objects of the Association. Following the two great leading principles on which it was founded, namely, the diffusion of existing knowledge as to the application of chemistry to agriculture, and the enlargement of that knowledge, the committee will notice, first, what has been done in the way of lectures and other methods of affording information; and, secondly, what has been done by analytic investigations in the laboratory for the guidance of agriculturists and the advancement of the science. 1. It may be remembered that the committee in January last announced, that by way of an opening to the business of the Association, Professor Johnston had, at the solicitation of a number of leading agriculturists in the neighbourhood of Edinburgh, agreed to give three lectures on subjects of general interest. These lectures were accordingly given, and by the numerous assemblages of both landlords and tenants which they produced, proved the deep interest taken in the objects of this institution, as well as the eminent qualifications of Professor Johnston for the duties of the office he had undertaken. These lectures in Edinburgh were, after a short interval, followed by invitations from various local agricultural societies throughout the country to Professor Johnston to deliver similar lectures at the great towns with which they were connected. The subjects of lecture were the General Theory of Manures—Food of Plants—Uses of Manures—Mode of applying them—Methods of improving the Soil—the Benefit of Draining—the Use of Lime—the Qualities and Use of Guano—and the Feeding of Stock. The committee cannot doubt that one result of these visits by Professor Johnston to different districts was to stimulate and extend the desire among both proprietors and tenants for information on the subject of scientific agriculture. Within the last 12 months no less than seven or eight periodicals have been started in Scotland, and three of them within the last three months, exclusively devoted to the diffusion of information on the subject of Agricultural Chemistry and its practical uses. Farther, it deserves to be mentioned, that several of the parochial schoolmasters in the west of Scotland, perceiving the wishes of the farmers, that their children should imbibe some knowledge on these subjects, and at all events a taste for them, for which one lesson in the week might suffice, prevailed on Professor Johnston to compose a little treatise of a popular nature for their use; and one of them has recently applied to him to learn whether during the vacation of his school he may be permitted to attend the laboratory in Edinburgh, with the view of making himself more familiar with the science. That this is not to be traced to any fanciful idea of his own, is clear from the fact that the farmers of his neighbourhood have agreed to raise a sum of money among themselves to defray his expenses. If either this year, or in a future year, a sufficient number of such applications were made, the committee are happy to announce that Professor Johnston would be willing to give a gratuitous course of lectures to schoolmasters during three weeks of their autumn vacation. 2. The committee have the satisfaction of stating that the advantage of knowing something of the chemical nature of soils, manures, and other substances connected with farming operations is now becoming universally acknowledged and acted on; in proof of which it is enough to mention that during the last six months no less than 242 analyses, of one kind or another, have been performed by Professor Johnston and his assistants—being on an average more than one-and-a-half for every lawful day. When the delicate nature of many of these analyses is considered—some of them requiring many days for their performance, it will be acknowledged that in this department a very large amount of work has been accomplished. The subjects of these 242 analyses were as follow:—Soils, 90; Guano, 77; Waters, 25; Ashes of Plants, 14; Marls, 9; Miscellaneous, 27. The committee may here refer to some of the cases of analyses made in the laboratory, in order to point out to persons who are not members of the Association the practical benefits derived from such information. They will give some instances under different heads:—1. As to Analysis of Soils. Mr. F., a proprietor in the west of Scotland, having sent some samples of soils from his estate for examination, wrote as follows to Professor Johnston, after receiving the analysis:—"From your analysis of my soils it appears that they are deficient in magnesia and the phosphates, which accounts fully for the very beneficial effects of both these substances when applied to my soils as a manure.

It is a striking instance of the good that may be obtained from accurate analysis, showing that time may be saved by minute attention to its indications, and that the total failure of a crop may be prevented." 2. As to the Analysis of Guanos. Three several kinds of artificial guano, well known in the market under different names, and selling at as high a rate as natural guano, were during the last six months sent to the laboratory by members of the Association, that their agricultural value might be determined. In each case it was found that the prices charged were from one-third to one-half above the real value of the compound, and that in truth it would be better to spend the sum proposed to be laid out on these mixtures in buying natural guano. It is hardly necessary to add that the advice so given was very readily followed. But the farmer must be on his guard against adulterations, even in what is sold as natural guano; for very recently a large quantity of a manure alleged to be genuine guano, was sent down to Dumfries for sale there, by one of the most respectable houses in London, which on examination was found to contain 75 per cent. of chalk, and to have been coloured by spent bark ground to a fine powder. The committee may farther mention under this head that a chemical manufacturer in Leith had a quantity of waste refuse, considered of no value, and which had accumulated on his premises—to the extent of about 100 tons—when it occurred to him to send a sample of it for analysis to Professor Johnston. He found that it contained substances extremely valuable as a manure, and recommended that it should be sold as such, at the rate of 3*l.* per ton. The result of this discovery has been, as may be supposed, eminently beneficial, not only to the manufacturer, but to the farmer, and in so far to the country at large. Further, the committee may refer, in illustration of the benefits derived from analysis, to a letter addressed to their secretary, by a member of the Association, and one who is himself an extensive farmer:—"Sir—In answer to your query, Whether or not, as a practical farmer, I have as yet benefited from the existence of the Agricultural Chemistry Association? I beg to say that my annual outlay for foreign manures, such as rape-dust, guano, bones, &c. upon an average of years is much about 150*l.* Previous to the existence of the Association, I was obliged to make my purchases, with no other means of judging of their probable genuineness or fertilising properties than by what their appearance indicated; but this last season I have invariably made my selection after obtaining a minute analysis of the different samples, and choosing the one most favourably reported on by the chemist, and, upon delivery of the stock had a second analysis performed, in order to satisfy me that it was not inferior to the samples from which I bought. I have no hesitation, therefore, in concluding that, by such means, I have been enabled to spend my money with a degree of certainty and satisfaction, which amply repaid me for the trifling expenses I incurred. In illustration, I may mention that part of a cargo from which I obtained my supply was found inferior to the rest by 10 per cent., but I, of course, was enabled, by the plan adopted, to demand compensation, which was immediately conceded. With regard, likewise, to the feeding of my live stock:—Having obtained from merchants samples of such foreign cake as they had, I submitted them for analysation to Professor Johnston, and from amongst them was enabled to select one which was offered to me as a manure, which I purchased at 85*s.* per ton. Having confidence in what it was composed of, I gave a regular supply to a breeding stock of black-faced ewes, at a very small cost indeed; and I am not exaggerating my probable gain, by that discovery, at from 50*l.* to 60*l.* The ewes, though feeding on stinted hilly pasture, were in a condition, at lambing time, never witnessed in former seasons. I have never as yet got any soil analysed; but I doubt not that much ignorance prevails among farmers as to the application of lime; and by simply obtaining a correct report from the chemist as to whether that ingredient is present to the necessary extent in the soil, one might determine upon a system of management, either most profitable to adopt, or save themselves an outlay which might be very needlessly and ruinously made. I trust many of the difficulties that presently embarrass practical men, will be gradually removed when the officer of your Association obtains a better acquaintance with practical agriculture, and thus better enabled to test, by the aid of science, those conflicting results which so often baffle and perplex the most experienced and enlightened farmers. What I have mentioned will, I hope, be considered a sufficient answer to your query. I am a rent-paying farmer, and must not lose sight of profit and loss. I have no idea of substituting mere theory for practical results, but I envy not the landlord or tenant who will refuse to consult a man of science, in order to see whether or not the art might be advanced, by which they not only live, but for its improvement are responsible to the whole community." Whilst thus explaining the great practical benefits afforded by chemical analysis, the committee would beg to remind subscribers that in applying to Professor Johnston it is material that the party should inform him of the precise object he has in view, seeing that testing for a particular ingredient can be had for 3*s.*, whilst an analysis ascertains all the ingredients, and costs at least 12*s.* 6*d.* To assist subscribers in this matter, the committee intend to draw up and circulate among them a list of charges, with such explanations as will remove all difficulty. And here the committee would take the opportunity of adverting to the cheapness of the terms on which these benefits may be obtained through the medium of the Association. Most persons not being aware of the labour and cost attending chemical analysis, it may be right to state the expense which has been *bonâ fide* incurred by Professor Johnston during the last six months. These expenses—consisting of salaries to his assistants, chemical tests. &c., house rent, taxes, gas, &c.—amount to 250*l.*; whilst for the 242 analyses performed during that time, only 98*l.* of fees has been received, thus leaving a deficit for the half-year to Professor Johnston of 152*l.*, and impairing to that extent his income out of the subscriptions received by the committee of management. The laboratory has been useful, however, in another way than in merely affording analyses to subscribers. It has been employed also in extending our knowledge of the science of Agricultural Chemistry, of which the committee might give several interesting illustrations. But here they would be out of place, and other means will be adopted for bringing them before the public. It appears, however, from some of these researches that the ash of plants varies much more in composition according to the soil and manure in which they are grown, than has hitherto been supposed, and that more is really within the power of the skilful farmer, in the way of modifying the nature of the vegetable food he raises, than without these researches could have been expected. In Mr. Johnston's Report, lately distributed among the members of the Association, mention was made of the composition of Turnips raised with guano and with farm-yard manure; some experiments recently made with the same Turnips, under the direction of Lord Blantyre, have shown that they not only differ in composition, but have very different feeding properties, thus showing the connection between the manure employed and the value of the food raised.—Sir John Hope moved that the meeting approve of the Report now read, and give their best thanks to the committee of management for their services during the last six months.—Mr. Scott of Craiglockhart seconded the motion. Every one (he said) must be convinced that the institution had done a great deal of good to practical agriculture; and especially in relation to the testing of guano. A subject to which he was desirous of alluding was the disease of Potatoes. It extended this year further than it did the last year, and if it continued to extend in the same proportion in which it had done during the two last years, the consequences to the country would be most disastrous. The diseases, which were three in number, he considered to be of so many several kinds, and he thought it would be extremely desirable for the Association to endeavour to throw some light upon the subject. Many of the most careful and most experienced agriculturists were at this moment suffering from it to a very great extent, notwithstanding the exercise of every precaution which skill and experience could suggest.—Mr. Milne, advocate, as one of the committee of management, thanked the meeting for the approval of the Report, and expressed satisfaction at the manner in which Mr. Scott, a practical farmer, had expressed his approbation of the way in which they had brought the Association to its present state. Before sitting down, there were two points to which he was desirous of calling the attention of the meeting. One was the advantage of obtaining analyses of manures; the other the advantages of agricultural schools. In regard to the first, it was inconceivable what a vast sum of money was expended by the agriculturists of this country for manures. They all knew that farm-yard manure was generally insufficient for the purposes of cultivation, and, therefore, recourse must be had to other manures. One farmer expended 150*l.* a-year on foreign manures; and he (Mr. M.) held in his hand a note of the sums expended on an average in the year for manures, as follows:—Bone-dust, 91,755*l.*; rape cake and rape-seed, 169,331*l.*; guano (being the amount imported, not for the country at large, but to Liverpool alone, in one year), 59,240*l.*; being a total of upwards of 320,000*l.* These were the sums expended in manures; and if they were to believe the accounts in the newspapers, which stated that 300 vessels are to be sent to bring home guano, they would soon have an expenditure by the farmers of several millions for this article alone. Now, it was of the greatest importance to check adulteration in guano, because it was hardly possible to take up one of the new publications devoted to this subject, without seeing the enormous extent to which the industrious farmers of this country were defrauded by its adulteration. He had brought with him a number of the *Gardeners' Chronicle*, edited by Professor Lindley, a periodical which was of essential service to agriculture. In this publication many places were mentioned where manures were sold, containing hardly one of those substances whose specific virtues were required. (Mr. Milne then read several extracts from the publication in question, detailing cases at Hull, in Cheshire, and Dumfriesshire, in which guano and bone-ash were sold as pure, although they were adulterated to an almost incredible extent with other substances, either of a noxious nature, or useless as manure. It was a remarkable fact, he continued, that while England had been inundated with these spurious mixtures, Scotland had been in a great measure free of them; for it appeared that of the seventy-seven analyses of Professor Johnston, not one of them had been spurious. Whether or not these dishonest dealers were afraid of venturing upon our soil, knowing that a check existed, and that there was, therefore, a risk of exposure, he did not know; but such was the fact. He mentioned this to show of what consequence it was to the farmers, who spent such large sums upon manures, to have the means of protecting themselves against these frauds, which had the effect of causing them not only to throw away their money, but also to injure their land and their cattle.—A motion for a vote of thanks to Mr. Coventry was then unanimously agreed to, and the meeting then broke up.—*Abridged from the Edinburgh Evening Courant.*

FARMERS' CLUBS.

Burton-upon-Trent.—At the usual monthly meeting, Mr. Lathbury read some remarks on The Application of Steam to Agricultural Purposes. He had erected a steam-engine on his farm, and had applied its power to a threshing-machine, a chaff-cutter, and a corn-crushing machine, and had connected with it an apparatus for the steaming of cattle provender. The outlay had been considerable, and would have been better repaid on a larger farm, as the engine and machinery was capable of doing three or four times the work he required it to do. Still, taking into consideration the saving he had effected in threshing his corn, and in a more economical plan of feeding his cattle and horses through the winter, the result had been on the whole very advantageous to him. The whole outlay for his six-horse-power engine, and the rest of the machinery, was about 180*l.* The interest on this sum, together with an allowance for wear and tear, he calculated at 15*l.* 15*s.* He had used his threshing-machine 23½ days. He required, on an average, the labour of one man and four women, besides his own superintendence, and his coals cost about 2*s.* 6*d.* each day. The whole expense in labour had amounted to rather more than 8*l.* Reckoning Wheat at 5*d.* per bushel, Barley at 2*s.* per quarter, and Oats at 1*s.* 8*d.*, the quantity of corn he had threshed would have amounted to rather more than 36*l.* if thrashed by hand. The saving effected by the threshing-machine had therefore more than repaid the whole annual expense of the outlay; but in the cutting and steaming cattle food he had, as he thought, saved much more. With regard to the steaming of food there were various opinions. The experiments which had been tried seemed to prove that no advantage attended it in the case of grain or roots; and though it was admitted that the steaming of dry fodder enabled cattle to extract a larger portion of nutriment from a given quantity, yet it was doubted whether the cost of the process did not outweigh the advantage gained. He was of opinion that where the cost could be reduced to so insignificant a sum as by his method, the advantage was great. The effect of steaming was not to alter the nature of the food: it did not convert poor food into rich: its simple effect was to render more of the nutritious part of the food digestible. By bruising grain, every particle was exposed to the action of the juices of the stomach; and cattle could break down the substance of roots and green crops thoroughly with their teeth; but in dry fodder some part of the nutriment escaped the action of the stomach, because the fibre could not be thoroughly broken up by mastication. By cutting fodder into short lengths, and steaming, it was rendered tender, and was made to resemble green food. By steaming, both hay and straw might be made more nutritious. and we might substitute a portion of straw for hay, and still keep cattle doing as well as on dry hay alone. He thought it a great advantage to consume a good part of the straw as provender, provided you could do so, and yet keep cattle in condition. The necessity of mowing pastures to a large extent was thereby avoided; it was unprofitable to exhaust pastures by mowing them, and to repair the waste by manure. The manure would be better employed on the arable land, and the pasture would yield a better profit by having its produce consumed on the ground. During the last winter he had 90 head of neat cattle and horses, and he fed them during the whole time on steamed hay and straw. He had a simple apparatus for steaming attached to the boiler of his engine, by means of which the chaff was steamed with great quickness. The coals for the work of the engine and for the steaming, each time cost 1*s.* He cut and steamed 600 or 700 strikes twice a week, and the labour of two men for two hours was sufficient. The cost was not, therefore, more than 4*s.* a week for steaming the food of 90 head of stock. Up to the 14th of February he kept all his stock on one-third hay mixed with two-thirds straw. After that time, finding his cows get in low condition, he used half straw and half hay, and gave the milking beasts a foddering of hay morning and night. As they calved he added a pound of linseed to their steamed food. With this diet his cows grew fast and got into milk as well as he ever remembered. Contrasting his consumption of hay in this and former years, he calculated that he had saved 40 tons; but he thought that if he had used 10 tons more it would have been better, and he therefore set down 30 tons as his saving. The difference between the consuming price of 30 tons of hay and the 30 tons of straw which supplied its place, reckoning hay at 3*l.* 10*s.*, and straw at 1*l.* 5*s.*, would amount to 67*l.* 10*s.*, while the expense of cutting and steaming amounted to less than 5*l.* A very general opinion was expressed that it was more advantageous to have Barley threshed by the flail: when thrashed by machine the pile was cut off so close that it turned out much less measure. Mr. Payne would, notwithstanding the greater weight of samples threshed by machine, prefer Barley threshed by flail at 2*s.* per quarter more, for the purpose of malting. Except for very extensive farms, it was thought that the great outlay required for steam-power, rendered it more expedient to use either the flail or horse-power machines, unless the landlord would be at the cost of erecting the necessary buildings.

Darlington.—At the late monthly meeting of this Club, the subject for discussion was, The comparative Advantages of Stall and Pasture-feeding for Draught Horses and other Cattle during Summer; with the best and most profitable Green Fodder for Soiling or Stall-feeding. A

discussion ensued, during which the whole subject was brought under review, when the members were unanimous in opinion that it was in most respects decidedly preferable to soil draught horses with green food during summer, but more particularly in consequence of their being able to feed in a much shorter space of time on green Tares or Clover laid before them, than what they could do if turned out to pasture. They would obtain more rest, would not be teased by flies and other insects, and by those means would keep in better condition; besides, a much less quantity of land would keep either draught horses or any other heavy cattle when soiled in the stall or yard, than would be required if they were pastured upon the land. A greater quantity as well as a better quality of manure would also be produced by soiling, for in dry weather during summer the cattle droppings in the pastures are dried by the sun and wind, so that a considerable portion of the soluble matter evaporates and is lost, whereas the manure produced by soiling in-doors can be preserved of good quality in much greater quantity, and can be applied to the land with greater advantage at suitable seasons. As to milk cows and feeding beasts the Club were not so unanimous with regard to soiling them during summer, and further experience seemed to be wanting in soiling heavy-horned cattle. Some doubts were also expressed by one or two members as to the suitableness of green Tares or Clover for milch cows, they believing that this kind of food had the effect of causing the butter produced therefrom to be light and oily, and also that green Tares produced thin and poor milk; however, the majority were in favour of soiling all heavy cattle during summer, believing by that means that a much greater number of cattle might be kept on a farm than what could be done by turning them upon the land to depasture. With regard to the best and most profitable kind of green food for soiling, the unanimous opinion was that winter and spring Tares, in conjunction with Clover, with a little Italian Rye-grass sown amongst it, were the best and most profitable for soiling in this part of the kingdom, but that Clover, so far as it could be made available, was preferable to Tares, it being generally believed that draught horses fed upon green Clover, stood their work, and kept their condition better than when fed upon green Tares; whilst, at the same time, Tares are believed to exhaust the land more than Clover. At the conclusion of the discussion, the secretary laid before the meeting 21 handsomely bound volumes of "The Journal of Agriculture," and Prize Essays and Transactions of the Highland Agricultural Society of Scotland, which were presented to the Club by Lord H. Vane, M.P., and John Bowes, Esq., MP., representatives of South Durham. A unanimous vote of thanks was awarded to them for this very valuable donation of books, and for their kindness in encouraging and supporting the interests of the Darlington Farmers' Club and the science of agriculture generally. The subjects fixed for discussion at the next monthly meeting of the Club are—The best Method of making and securing Hay; and the best Season of the Year for applying Manure to Grass lands.—*Yorkshire Gazette.*

East Cornwall.—At the late meeting of this Society F. Rodd, Esq., of Trebartha, detailed some experiments he had made on manures of different kinds. North-hill Lower-park, the subsoil of which is slate and spar, value about 18*s.* per acre, he had manured with Turnip-tops and roots as a manure for Wheat. It was ploughed at Christmas, 1841. One portion was tilled with Turnips, and another with Potatoes, the whole being equally manured with a compost of lime and earth, with the addition of some farm-yard dung. The produce was about 240 bushels of Potatoes and about 30 tons of Turnips per customary acre. In November, 1842, the Potatoes and Turnips were carted away, first cutting off the tops and roots of the latter, and laying them in the furrows after the plough, during the process of preparing that portion of the field on which the Turnips had grown. The produce of Wheat the following year was, on the Turnip ground, 36 Winchester bushels of grain, and on the Potato, 28 bushels per customary acre. On a small portion of the Turnip ground, no Turnip leaves were laid, and on this part the crop of Wheat was decidedly inferior to the part so manured; while that in the Potato ground was inferior to both. The whole of this field was now in Barley, and there was a fine and promising crop throughout, but presenting no visible difference in favour of the Turnip ground. Outer North-hill-park, adjoining the last field, and similar to it in all respects, was in 1842 in Grass, and treated precisely the same as the former—one part of it being filled with Turnips and the other with Potatoes. In 1843 the leaves of the Turnips were laid as before in the furrows of the Turnip ground preparatory to the Wheat tillage. The Wheat now growing on the Turnip ground maintains the same apparent superiority over that on the Potato ground, as shown in the previous instance. A portion, however, of the Wheat on the Potato ground received, in the spring of the present year, a quantity of undiluted liquid manure, in the proportion of 46 hogsheads to the acre. The Wheat thus treated is far superior in its growth and appearance even to that grown on the Turnip ground and manured with the tops. But the plant on which the liquid manure had produced the greatest effect, was the Cabbage, which in some instances had been forced by it to double and even treble its ordinary size, not to mention the copious after-crop of sprouts from the old stump. An experiment on the effect of folding sheep on Wheat had been tried on a field of his, the subsoil of which was spar and slate, worth 1*l.* per acre. In 1843, it was ploughed down and prepared for Wheat, manured with 20 loads of dung, mixed with double that quantity of earth, and tilled in the following October. In March, 1844, he folded Southdown sheep and lambs on it by night, in the proportion of from 800 to 1000 sheep to the acre, changing their ground every night, and turning them into Grass pasture by day. The difference between the Wheat grown on the folded ground, and on the portion not folded, was very manifest. Specimens of Wheat affected by the foregoing modes of management were produced, fully confirming the statements made.

Netherexe.—In May 1843 it was resolved by this Club that the best method of keeping Clover-seed for a longer period than a year was as follows:—The seed should be made thoroughly dry, placed in casks about three-fourths full, tightly stopped, and frequently rolled during the time it is kept. In June it was considered that drills from 15 inches to 20 inches apart on a flat surface, and 27 inches on ridges, would be best for drilling Swede Turnips, and that a pint and a half of good seed would be enough per acre. In December, the best sorts of Wheat for early and late sowing was the topic introduced, when it was considered that the best sorts for early sowing in this neighbourhood are Honeyball and Brown's Prolific; and for late, Redstraw or old Lammas.

Stowponey.—At the late meeting of this Club, Mr. W. Griffithes, being called upon, read a paper on The best Method of Harvesting Corn, from which the following are extracts:—"I think the kind of Wheat, whether red or white, and the difference of soil upon which it is grown, has something to do with the state of ripeness in which it should be cut, believing, from the little experience I have had, that Wheat grown upon strong soil—Wheat and Bean-land—is more injured in appearance of sample by being allowed to get ripe, than Wheat grown upon light soil, or what is termed Turnip and Barley-land. I find my Wheat, which is cut first, and consequently generally greener than that succeeding it, the best sample, and most pleasing to the millers, whose taste in this particular I endeavour most especially to gratify. I should say the best time to cut Wheat is when it is arrived at that state of ripeness sufficient to admit of its being cut without causing the Corn to shrivel or contract into wrinkles, by which we may secure plump, well-filled culms, with a bright thin skin upon them. I have not observed that white Wheat, in the sale of it, is so much affected by being suffered to get quite ripe, as red Wheat is; but as the sorts are frequently grown upon different soil, the advantage, if any, may arise from that cause. As to the manner of cutting Wheat, whether with scythe, or broad hook, or sickle, I consider the scythe and broad hook equal in many respects (except in tying up of the sheaf, which is not always done, I had nearly said, could not be done in so workman-like a manner after the former as the latter). The land from which the Wheat has been cut with either broad hook or scythe, certainly gains many advantages over that from which the Wheat has been cut with the sickle, the chief benefits of which system seem to consist in the appearance and handiness of the Corn after it is cut, which is certainly better in many respects. With regard to Barley, to the production of which a large portion of the land in this neighbourhood is appropriated, and the quality of which may be affected by its state of ripenness when cut, I am of opinion that it should be allowed to get nearly ripe; it is injured by being cut before being ripe enough. Barley is also much affected by the after management in the field in wet weather; and as situation has much influence over that, I would rather leave to every person's judgment the selection from the different plans adopted of what suited his circumstances. The waggons used for carrying grain in harvest time have been (the generality of them) built with the view of carrying much heavier loads, and consequently are much heavier and stronger than would be required for the purpose of carrying grain in the straw; but if waggons were built for the purpose, and so constructed that the fore-wheels would turn under the chest, as some at present do, which enables them to be turned nearly as short as a cart, I think they would then be the best adapted for that purpose in this country. In some parts of England, and the whole of Scotland (whence so many agricultural wonders come), carts are used solely for that purpose, I believe; but from what I have seen done with carts, and when used by their advocates too in this neighbourhood, at harvest work, I make no wonder that more converts to the system are not made. As regards the best place for making ricks, whether in the field or rickyard, I cannot conceive it to be good policy to draw grain a long distance home in a very busy time, however pleasurable the sight of a well-filled rickyard may be, as there is generally more loss of time when waggons have a long distance to go and come than when ricks are made in the field, from which they can be removed in winter at much less expense than in harvest. Thus have I gone over the different subjects intrusted to me, and though in a very inefficient manner, still let me beg of you to make up the deficiency by your discussion and elucidation of them, so that the subject may not suffer on my account.

'If a better system's thine,
Impart it frankly, or make use of mine.'"

The paper was received with much satisfaction by the meeting, when an animated discussion arose amongst the members present, and it was finally resolved "That it is advisable to cut Wheat generally a little before it is ripe, and that the best manner for cutting, on an average of years, is with the sickle; that waggons of a light construction are preferable to carts, and that the best place for making ricks when at a distance is in the fields."

Reviews.

Lectures on Agricultural Chemistry and Geology.—By James F. W. Johnston, M.A., F.R.SS., L. and E. Reader in Chemistry and Mineralogy in the University of Durham, &c. William Blackwood and Son, Edinburgh.

It is not one of the slightest merits of this work, that many of the early Lectures published in it, were actually delivered to an Agricultural Society—to farmers, in fact, "most of whom possessed no knowledge whatever of scientific Chemistry or Geology. They commence, therefore, with the discussion of those elementary principles, which are necessary to a proper understanding of each branch of the subject. Everything in such Lectures, which is not—or may not be—easily understood by those to whom they are addressed, is worse than useless."*

And thus, while it is a complete work on Agricultural Chemistry, giving all the explanations and suggestions which can be founded on the science in its present state, it may at the same time be understood by any one altogether ignorant of the science, who will take the trouble to read it through from the beginning.

The first Lectures contain the materials by which, in those which follow, the details of agricultural management are explained, and improvements in it are suggested. Thus, one of the last subjects treated of is the very important one—the conversion of vegetable matter into the substance of animals. This properly occupies the latest attention of a lecturer on Agricultural Chemistry, as it is itself one of the *ultimate* objects to which the whole practice of farming tends. The following summary of the views of Chemists on this subject, is extracted from the last Lecture of the series:—

"1. It appears that all vegetables contain ready formed—that is, form during their growth from the food on which they live—those substances of which the parts of animals are composed.

"2. That from the vegetable food it eats, the animal draws directly and ready-formed the materials of its own body—phosphates to form the bones, gluten, &c., to build up its muscles, and oil to lay on in the form of fat.

"3. That during the process of respiration a full-grown man throws off from his lungs about 8 oz., a cow or horse five times as much, of carbon every 24 hours; and that the main office of the starch, gum, and sugar of vegetable food is to supply this carbon. In carnivorous animals it is supplied by the fat of their food, in starving animals by the fat of their own bodies, and in young animals, which live upon milk, by the milk sugar it contains.

"4. That muscles, bones, skin, and hair undergo a certain necessary daily waste of substance, a portion of each being removed every day and carried out of the body in the excretions. The main function of the gluten, the phosphates, and the saline substances in the food of the full-grown animal is to replace the portions of the body which are thus removed, and to sustain its original condition. Exercise increases this natural waste and accelerates the breathing also, so as to render necessary a larger *sustaining* supply of food, a larger daily quantity to keep the animal in condition.

"5. That the fat of the body is generally derived from the fat of the vegetable food—which fat undergoes during digestion a change or transformation by which it is converted into the peculiar kinds of fat which are specially fitted to the body of the animal that eats it. In carnivorous animals the fat is derived directly from the fat of their food, which is, in like manner, changed in order to adapt it to the constitution of their own bodies. In cases of emergency it is probable that fat may be formed in the animal from the starch or sugar of the food.

"6. In the growing animal, the food has a double function to perform: it must *sustain* and it must *increase* the body. Hence, if the animal be merely increasing in fat, the food, besides what is necessary to make up for the daily waste of various kinds, must also supply an additional proportion of oil or fat. To the growing animal, on the other hand, it must supply also an additional quantity of gluten for the muscles, and of phosphates for the bones. If to each of a number of animals equal quantities of the same kind of food be given, then those which require the smallest quantity of food to sustain them will have the largest proportion to convert into parts of their own substance. Hence, whatever tends to increase the sustaining quantity—and cold, exercise, and uneasiness do so—will tend, in an equal degree, to lessen the value of a given weight of food, in adding to the weight of the animal's body. To the pregnant and to the milk cow the same remarks apply. The food is partly expended in the production of milk, and the smaller and leaner the cow is, less food being required to sustain the body, the more will remain for the production of milk.

"7. Lastly, that the quantity and quality of the dung, while they depend in part upon the kind of food with which the animal is fed, yet even when the same kind of food is given, are materially affected by the *purpose* for which the animal is fed. If it be full-grown and merely kept in condition, the dung contains all that was present in the food, except the carbon that has escaped from the lungs. If it be a growing animal, then a portion of the phosphates and gluten of the food are retained to add to its bones and muscles, and hence the dung is something less in quantity, and considerably inferior in quality to that of the full-grown animal.

"So it is in the case of the milk cow, which consumes comparatively little in sustaining her own body, but exhausts all the food that passes through her digestive

* Preface to Professor Johnston's Lectures.

organs for the production of the milk which is to feed her young. The reverse takes place with the fattening ox. He takes little else from the rich additional food he eats but the oil with which it is intended that he should invest his own body. Its other constituents are for the most part rejected in his excretions, and hence the richness and high price of his dung."

Miscellaneous.

Potato Blossoms.—My Potato garden of last season was divided by the avenue, two-thirds on one side and one-third on the other. I commenced pulling off the blossoms from this one-third, intending to do so to the whole field, it being a favourite theory with me that the blossom weakens the tuber; but I did not do more than this third, because people said it was useless, and also indeed because it spoiled the blooming beauty of the field. This third was planted in the middle of April, the remainder towards the end of that month. Those from which the blossoms were pulled were much more productive, and that produce very superior in quality and appearance to the other portion of the field. Being very particular in the selection of my seed, I had them sorted as usual, when drawing home in winter, into separate pits; those for seed being put in small pits, two feet wide, and those for sale or consumption in pits five or six feet wide. The seed put in the small pits for seed was selected from the two-thirds sown in the end of April, as I always heard it recommended to use the late rather than the early seed; this sorting, remember then, were from the Potatoes from which no blossoms were pulled last season. This season we commenced planting on the 20th of April, from the seed so selected and pitted in the small pits; but as the seed ran short, we opened the large six-feet-wide pit, and sowed nearly as much more; the only difference beside the seed was, that what was allowed to blossom last season had fine, well-rotted, well-prepared dung, while the latter got manure recently gathered from the yard, fresh and strawy; the difference now, however, is very great—those from which the blossoms were taken, having come up stronger, and far outstripped the others, although from the manure and care taken, the others are amongst the very best in the neighbourhood: there are some failures, but not one from the unblossomed seed, which even when accidentally cut with the spade and bruised with the wheel, yet remained perfectly sound; but this cannot be said of the others. In a few places where the seed of the unblossomed ones happened to be displaced, and left on the surface of the drill, exposed to the great drought of this season, it grew and took root, sending down fibres round the set into the ground, but the others, wherever displaced, shrivelled up and decayed. Thus I am convinced that good sound seed will not be injured or prevented from growing by almost any neglect; while tainted seed, be it ever so sound in appearance, can scarcely be kept alive even with the greatest care. Where great care in planting and manuring has been taken, and yet the crop grows slowly, it is an evidence that the seed was not the soundest, and that but for the care taken they would not have grown at all. To the weakness of the seed all failures may be traced; and therefore, to grow and preserve the seed should be the chief concern in Potato culture. So far for the practical result; and in theory I believe botanists would advise that to pull off the bloom will add to the tubers below: that it adds to the quality and soundness, the above result fully satisfies me. You are aware of annuals being kept alive for two, three, or more years, by depriving them of the bloom as it appears: the above sort of Potato does not generally bear berries; still if keeping the blossoms off prolongs the existence of the plants, as it did with me last season, they will, of course, during the growing season, be adding to the quantity and quality of the tubers below; for of two objects to be attained by a plant—that of bearing seed above, and ripening tubers below—it will surely do one much more perfectly if its energy be confined to it. Some writers affirm that excessive seed-bearing produces the curl in Potatoes, and instances like effects in the animal kingdom. It is remarked, also, that in dry seasons bulbous and tuberous roots are more apt to bear seed; and perhaps it were well if some persons would take the trouble to look back and see if the failure in Potatoes did not generally follow previous dry summers. This being a dry summer, if the above remarks contain any truth, it were well if people would devote some attention this way, and give employment to many poor children; and indeed if the matter be of the importance that I think it is to the country at large, the committee of the Irish Agricultural Improvement Society ought to be directed this year to try the experiment on a large scale. I am so entirely in favour of it that I shall not try any *comparative* experiment myself, but will destroy all the blossoms with as much care as I would the weeds. I pick the blossoms off before they expand; the flower-stalk being then brittle it is much more easily performed.—*F. T., in the Dublin Farmers' Gazette.*

Utility of Experimenting. — Shell-fish, a valuable Manure.—Last year we stated the case of an intelligent gentleman, who had planted Beans in the same rows with Potatoes, and the experiment, we are happy to say, succeeded so well that the produce, when reaped, exceeded expectation—36 Winchester bushels of Beans, in addition to 12⅕ tons of Potatoes per acre, and both articles of superior quality. In agriculture, fortunately, nothing whatever can be done in a corner, to the disadvantage, were it desired, of the surrounding community; and accordingly, so many persons, including gainsayers, watched the minister's new-fangled husbandry, that this year, in place of one, there are at least a hundred acres of land under the same species of culture in a district closely abutting on the shores of the Solway. Although some may allege the exhausting danger of forcing the soil to work double tides, the remark, we understand, is utterly inapplicable in the case before us. The land, when re-ploughed, appeared to be in its usual heart; and even had results ruled differently, how easy to restore equilibrium by additional dressing, at trifling expense. Had there been nothing in the shape of parasitic cropping, the tubers, in bulk and weight, could not well have exceeded the return given; so that the minister had his thirty-six bushels of pulse into the bargain. Our correspondent has made another experiment, which is, perhaps, of still greater importance to those who live within the sough of the far-sounding main. Having noticed the good effects of shell-fish in gardens, applied to Carrot and Onion beds, it occurred to him that the same species of manure would be found equally useful, on a still larger scale, in the case of green crop cultivated in the open fields. Accordingly, he instructed his servant to repair to the shore, and excavate four cart-loads of live shell-fish, composed chiefly of wilks, cockles, and muscles. When carried home the deposit was thrown into a heap, and allowed to remain until it began to emit an unpleasant odour. Warning thus given, the shells were smashed and mixed with peat earth, to absorb the moisture, and facilitate the sowing process. They were then laid in the drills, after the manner of bones, at the rate of 16 bushels per acre; and, the better to test the utility of the experiment, Turnips were planted the same day over thick layers of ordinary manure. But the shells took a wonderful start, by showing incipient braird at the end of three days, notwithstanding the intense drought; while the dung operated so slowly, that eight days elapsed before the slightest tendency to greening appeared. Thus far, therefore, the shells and substances inclosed have worked perfect wonders; and should brairding progress as it is doing at present, results ultimately will outvie crushed bones, or even guano, alike new and dear. As the trial thus made, so far from being concealed, was openly communicated to all and sundry, so many farmers have followed the minister's example, that above a hundred acres of Turnips, now that moisture has given encouragement to drilling, will be manured with shell-fish in the parish of Cummertrees. Of the most triumphant success scarcely a doubt can or does exist—the carbonate of lime and animal matter being each excellent nourishers of vegetable life. In fact, a shipper thinks so favourably of the sea-shore and its resources, that he intends to send vessels to the Highlands next spring to collect as many tons as the craft will carry, of an article to which kelp is poor in comparison. One heaped bushel of shell-fish weighs as near as may be a cwt.; and, on the banks where they grow, one man, with a clat and spade, may collect eight bushels during the recession of the tide. The layers are generally from 3 to 4 feet deep, intermixed with sand, and when the top is removed the next seaflood washes the debris so completely away, that the same ground may be gathered over again. By following this practice, two hundred tons have been collected within the last fortnight on the coast of Priestside. The prospect thus opened up is so full of promise, that it is strange it was not thought of sooner on something like an extensive scale. Along the coast of Britain and Ireland, immense quantities of shell-fish might be gathered annually at the expense of 10*s.* per ton, thus opening new avenues of employment to the poor, cheap manure to the farmer, and wealth hitherto neglected to the whole country, in place of making long voyages to Peru or Africa, in quest of an article which has risen to all but a prohibitory price. Some, peradventure, may fancy, that the beds of shell-fish thus industriously invaded, would in time disappear; such, however, is not our opinion. Renovation is inherent in everything mundane—witness the oysters devoured in such legions, east, west, south, and north, but which still continue to exist and multiply on the strength of the great principle hinted at, and bid fair to furnish, despite dilapidation, crops successive, till the crack of doom. Our informant as to the above important facts is the Rev. Mr. Gillespie of Cummertrees; and it is at his request we employ our own language in making the present communication.—*Dumfries Courier.*

Poison. — The Murrain. — Horsham, June 26. — Considerable excitement has been occasioned by a report that a whole family had been poisoned by partaking of meat in a putrescent state. The facts are these:—A Mr. Porteous, amongst whose stock a disease called the murrain had prevailed to a considerable extent, lost a cow, which had recently calved, with the disease, and his bailiff disposed of the carcass for 10*s.* to a poor man named Chapman. Chapman's object in purchasing the cow was to feed his chickens and pigs on it; but it seems they ate a portion of it themselves, and no inconvenience was felt. The chickens died, and the pig was either killed or died, and the family partook of it. In a very short time symptoms of an alarming nature exhibited themselves. At this crisis a medical man was called in, and upon his arrival at their dwelling, the effluviæ arising from the contents of it were almost overwhelming—the family, pigs, and poultry, it appears, all occupying the same apartment. He found Chapman and two of his children in a rapidly sinking state. Upon questioning them as to their diet, he discovered (from their neighbours) that they had been living upon putrid meat for some time. He then commenced a search throughout the premises, and removed the family to a tent erected adjacent, and had the residue of the meat, which was in a state of partial decomposition, buried. The remedies which he applied were, however, too late to save the lives of Chapman and his two children, who sank under the effect of poison, which had, no doubt, been taken up by the absorbents, and the blood impregnated with the virus. One other child, aged about 7 years, is scarcely expected to survive.—*Times.*

Smut.—With regard to smut, I am fully of opinion that with proper precaution the disease may be got rid of altogether; but with respect to peppercorns I am not so sanguine. Indeed, I know of no cure at present for this disease, except that of changing the seed. Several years ago I tried some experiments to prevent smut, which proved completely successful, and if I shall not detain the meeting too long I shall be happy to state them. In November, 1822, I selected three bushels of Wheat, which I had grown that summer, and which was exceedingly smutty; but to render it still more so, I had a quantity of smut-ball rubbed into it, until the whole was much blackened. The lot was then divided into six half bushels, and having dissolved half a pound of blue vitriol in boiling water, the Wheat was pickled as follows:—No. 1.—Immersed in the vitriol-water for three hours. No. 2.—Washed and skimmed until it was clean, then immersed in the vitriol-water as above. No. 3.—No preparation. No. 4.—Washed and skimmed well until clean. No. 5.—Washed and skimmed as above, then sifted quicklime over it, and mixed a quarter of a pound of salt with it. No. 6.—Pickled in the mode usually adopted, with a mixture of lime, salt, and water. The seed was sown the following day on a Clover lea, in six separate ridges, each 112 yards long, by four yards wide, half a bushel to each ridge, being at the rate of near five bushels per acre. Appearance of the braird:—Nos. 1, 2, and 5 came up thin, seeming to be at the rate of only two bushels per acre. No. 6 appeared to be at the rate of about 2½ bushels per acre. No. 4 appeared to be at the rate of about three bushels per acre. No. 3 appeared at the rate of about 4 bushels per acre. Sept. 5th, 1823.—The whole was reaped, each lot being carefully kept separate, and the result proved as follows:—No. 2.—Found only two smutty ears in the whole ridge, which, notwithstanding the care taken, might have come from an adjoining ridge. No. 1.—Had several smutty ears in it. No. 5.—From 30 to 40 black ears in the ridge. No. 6.—About a 20th part smutty ears. No. 4.—About a 5th part smutty ears. No. 3.—About one-half smutty ears. From which it appeared that vitriol, coupled with washing and skimming, proved to be an effectual cure, even to a sample of the description sown. Ever since, I have invariably used vitriol, and have found from 20 years' experience on upwards of 100 acres of Wheat annually that one pound to a sack of Wheat will prevent the disease, as I have never had smutty Wheat since. I believe the cure was effected in the above by destroying the vegetative powers of the damaged seed; for it will be observed that the produce was clean in proportion to the thickness of the plant. Half the produce was black in No. 3, which had no pickling, and half the seed appeared to have been destroyed in No. 2, to produce a perfect sample. The grain must be seriously affected by the disease before such beneficial effects would ensue from washing and skimming; but I am inclined to think that soil and season have considerable influence upon it. Some years ago I was requested to value 40 acres of Wheat in this neighbourhood, growing upon wet, poor land, and upon a very careful examination of it I found one-third consisted of smutty ears, and my calculation of the value was made accordingly. The owner informed me that the same seed had that summer produced on healthy land in the western end of this county a good sample. We do not now wash and skim, but simply use vitriol mixed with water, and a small quantity of quicklime to dry it.—*Report of the Cardiff Farmers' Club.*

Guano.—Since guano as a manure has for some time excited great attention among agriculturists, it may not be uninteresting to some readers to learn the opinion of a foreigner given a hundred years ago. The work from which I extract it is entitled "A Voyage to South America, undertaken by command of the King of Spain, by Don George Juan, and Don Antonio de Ulloa." This journal bears date 1741. They say nothing about guano exhausting the land; but their remark that it is not used for Wheat and Barley is worth attending to. The translation from which the passage following is extracted was published at London in 1760:—"The lands in the jurisdiction of Chancay, like the other parts of the coasts of Peru, are manured with the dung of certain sea-birds which abound here in a very extraordinary manner. These they call guanoes, and the dung guano, the Indian name for excrement in general. These birds, after spending the whole day in catching their food in the sea, repair at night to rest on the islands near the coast, and their number being so great as entirely to cover the ground, they leave a proportionable quantity of excrement. This is dried by the heat of the sun into a crust, and is daily increasing, so that notwithstanding great quantities are taken away, it is never exhausted. Some will have this guano to be only earth endowed with the quality of raising a ferment in the soil with which it is mixed. This opinion is founded on the prodigious quantities carried off from those islands, and on the experiment made by digging or boring, by which the appearance at a certain depth was the same as at the superficies; whence it is concluded that the earth is naturally endowed with the heating quality of dung or guano. This would seem less improbable did not both its appearance and smell prove it to be the excrement in question. I was in these islands when several barques came to load with it; when the insupportable smell left

me no room to doubt of the nature of their cargo. I do not, however, pretend to deny but that it may be mixed with earth, or that the most superficial part of the earth does not contract the like virtue, so as to produce the same effect; but however it may be, this is the manure used in the fields sowed with maize, and with proper waterings is found greatly to fertilise the soil, a little of it being put close to every stem, and immediately watered. It is also in use for fields of other grain, except Wheat and Barley, and consequently prodigious quantities of it are yearly used in Agriculture."—*From an Everton Correspondent.*

Liquid Manures.—It is now a pretty general belief among farmers that there is "some good" in liquid manures; but somehow or other we never see much preparation either for the collection or application of this, the cheapest and most valuable of all manures, and we verily believe that the subject is as yet scarcely thought of in a way to lead to any practical result by one *bonâ fide* rent-paying farmer out of the thousand. Now, having for several years been an experimenter in this way, and sensible of the very great importance and value of liquid manures, I shall here take the liberty of throwing in my mite to the general fund, by communicating the little I have gained by experience to my fellow-farmers—free of the quickset hedge which chemists generally inclose themselves in, when telling a plain tale to plain people. As I discard all chemical formulæ—the tank, watering-cart, and other *et ceteras*—from my system, and attach the fertilising ingredients to a substance they can actually work in with spades and shovels, I have the more hope that my plan will be followed. Chemists generally do not tell us the reason why liquid manures will not do when applied in a fresh state, though this is perfectly plain to all plain men. Liquid manure, if spread upon an impervious, poor, or gravelly soil, in a fresh state, is not retained long enough for its decomposition taking place, or for the roots of the scanty herbage drinking it up in its fresh state. It is put on liquid manure, and runs off nearly in the same state; but apply it to a soil rich in decayed and decaying vegetable matter, and on which a vigorous vegetation is going on, and it never fails of its extraordinary effects. The fertilising principle of the manure is separated from the water by the decomposition and filtrative powers of the carbon or humus—or call it what you will—in the soil, and retained there till absorbed by the rain, which is, in turn, drunk up by the plants, and is again separated and built up, or embodied in the growing plants; or the liquid manure is at once drunk up and decomposed in the structure of the plant, the water being evaporated by the leaves, and the organic matter built up atom by atom. The plan of administering liquid manures in a perfectly fresh state is probably the best of any, were it not for the continued care and attention, and consequent expense necessary in supplying our crops with saturated water in all their stages throughout the year, and were we certain of the exact strength of the solutions suited to their wants, but which, probably, is what the water will naturally take up and carry in solution. As we, therefore, cannot apply our liquid manures on the best principle, on account of the expense, we must try the next best plan, that of decomposing them by the aid of decomposed vegetable matter; and this can happily be done to great perfection by reducing the vegetable matter to the state of carbon or charcoal. The way we do is this:—After having laid in a good stock of charcoal—which we make from Peat, as being trifling in expense, easily pulverised, and withal an excellent manure of itself—we divide a shed, or any other building, into two compartments, one of which we make water-tight, by puddling the side walls with clay, to the height, perhaps, of two feet, and separated from the other compartment by a low water-tight wall or boarding. This is the fermenting tank, which is filled half or three parts full of pulverised carbonised Peat, and the liquid manure from the byre, stable, pig-styes, &c., &c., directed into it. This is allowed to remain mixed up with the carbonised Peat for three or four weeks, till the decomposition seems about completed, being occasionally stirred about after the composition has become about the consistency of gruel. The whole is then laded over the low partition into the second floor, which is also three parts filled with carbonised peat; and as this second floor is meant merely as a filter, we have it lower on one side than the other, by which means, in the course of a day or two, the carbonised peat is left comparatively dry. The water having passed off at the lower side in a crystal stream—fit for tea or toddy to the most fastidious—the first or fermenting floor is again filled as before, and the contents of the second floor, if considered saturated enough, is then shovelled up into a corner, and allowed to drip, and further dry, till used, which may be either immediately, or at the end of twenty years, as scarcely anything will affect it, if not exposed to the continued washing of pure water, or exposed to the influence of the roots of growing plants. By being thinly spread on a granary floor it soon becomes perfectly dry, and suited to pass through drill machines of all descriptions. The mixing of the carbonised Peat with the liquid manure on the first or fermenting floor, it will be observed, is for laying hold of the gaseous matters as they escape during the fermentation; perhaps other substances may effect this more effectually, but none so cheaply. I think by this plan it will be obvious to every one that a great many desiderata are at once obtained. In the first place, you get free of about 950 parts out of every 1000 of the weight and bulk of manure by the expulsion of the water; while at the same time you link all the fertilising properties contained in it to one of the most handy vehicles one can possibly think of—light, cleanly, and portable, and possessed of the peculiar property of holding together the most volatile subtances, till gradually called forth by the exigencies of the growing plants. Lastly, you get free of the nasty and noisome tank, the abominable hogshead and watering cart, with all its appendages, and are no more bothered with overflowing tank or over-fermented liquid, with weather unsuited for its application. You have merely to shovel past the saturated charcoal, and shovel in a little fresh stuff, and the whole process goes on again of its own "sweet will;" while the prepared stuffs lie ready for all crops, all seasons, and all times. The solid matter in the urine of the cow is estimated, by very high authority, to be equal in value to its weight of South American guano. This makes one's mouth water. In making these statements, I do not by any means wish to disturb the dreams of the chemists; on the contrary, I set a great value on dreams, when they happen to be on the right track, and have little doubt but a powdering of gypsum, mixed with the carbon, on our fermenting floor, would be very valuable; neither would I object to sulphuric acid, provided the chemists would furnish it gratis. I also beg my fellow-farmers clearly to understand, that I make no pretensions to this plan of applying liquid manure being a new discovery. I know you too well to propose such an absurdity. This is merely a modification of your old and tried plan of bottoming your dunghills with peat; but by charring, the peat is freed of its antiseptic qualities, and thus becomes of itself a much better and speedier manure and an admirable filter. But even peat, thoroughly dried and perfectly pulverised, I have no doubt might answer the end indifferently well.—*Inverness Courier.*

Artificial Manures.—Some farms, or portions of farms, are situated on the top or sides of hills, others at a distance from the fold-yards, to which the heavy carriage of fold-yard manure would be too expensive to afford an adequate return to the farmer, or perhaps altogether impossible; artificial manures, therefore, in these cases, by reason of their smaller bulk and less weight, are exceedingly useful. Artificial manures can be more readily employed as top-dressings than the farm-yard manure, and, on account of their being either in a state of powder or liquid, are more quickly carried into the soil by the rain, for the nourishment of the plants. The principal points to be looked to in the selection of artificial manures, are the comparative cost of the quantity required to manure an acre; the cost of application to the soil; the fitness of the manure to the nature of the soil; and the quantity of foreign matter, not possessing any manuring power, which they contain, whether introduced for the purpose of adulterating them or not. With regard to the first, namely, the comparative cost of the quantity of manure required for an acre for Turnips, and the cost of application to the soil, I have drawn out the following table, taking them at the present prices, and the quantities at such as have been tried with success.

Quantities and Cost of Manures for Turnips.

Name of Manure.	Quantity per Acre.	Cost per Acre.	Cost of Application.	Carriage to Farm.	Total Cost p. Acre.
		£. s. d.	£. s. d.	£. s. d.	£. s. d.
Guano	400lbs.	2 0 0	0 4 0	0 4 0	2 8 0
Rape Dust	1 ton	6 0 0	0 10 0	0 10 0	7 0 0
Woollen	1 ton	4 10 0	0 10 0	0 10 0	5 0 0
Nitrate	600lbs.	1 10 0	0 4 0	0 6 0	2 0 0
Guano and Wood Ashes	350lbs. / 15 bus.	1 15 0 / 0 15 0	0 5 0	0 3 6	2 19 6
Bone Dust / Sulphuric Acid	40lbs. / 20lbs.	0 1 8 / 0 3 4	0 4 6	0 2 6	0 7 0
Bone Dust	16 bus.	1 2 9	0 4 0	0 4 0	1 10 8
Pottevin's Manure	24 bus.	2 0 6	0 4 0	0 6 0	2 10 6

By the foregoing table you will perceive that bone-dust and sulphuric acid is by far the cheapest manure for Turnips, even if five times the quantity recommended by Liebig be applied, and that I have only included in the calculations those manures with which I have found that authentic experiments have been tried with Turnips. I therefore now add a table showing the quantities of the different manures and their prices, which have been applied to Wheat with success.

Quantities and Cost of Manures for Wheat as Top-dressings.

Name of Manure.	Quantity per Acre.	Cost per Acre.	Cost of Application.	Carriage to Farm.	Total Cost per Acre.
		£. s. d	£. s. d	£. s. d	£. s. d.
Nitrate of Soda.	112lbs	0 18 6	0 1 0	0 2 0	1 1 6
Nitrate of Potassa.	112lbs	1 6 0	0 1 0	0 2 0	1 9 0

With regard to the fitness of the different kinds of manures for different soils, those which are composed of various substances, as guano, may be considered useful on all soils; but those, such as gypsum, lime, and common salt, which consist of one substance, or salt alone, can only be expected to answer on land where that substance is nearly or entirely wanting, provided that salt is not one of ammonia. Farmers ought, therefore, to call in the assistance of the chemist to analyse the soil before they make use of them, or they will probably find, should they ultimately do so, that they have been applying to the soil a substance which it before contained in abundance; and to the want of this precaution may be attributed many of the failures with artificial manures which have taken place. The quantity of foreign matter or substances mixed with them, which are not of use as manure, depends upon two causes: if that manure is guano, either upon the carelessness and ignorance of the persons employed to collect it, in scraping up with it from the shores where it is found a quantity of sand and stones; or else it is caused by the dishonest mixture of sand with it after its arrival in this country. The quantity of ammonia in guano, on which principally this and many other manures depend for their fertilising qualities is easily ascertained by rubbing a small portion of it in the hand, with an equal quantity of quick lime; the scent then given ought to resemble smelling-salts. Sand may be detected in guano by stirring a small quantity of it in a tumbler of water; the lighter and useful portions will either float or remain in solution, and the sand will go to the bottom. Bone-dust is generally adulterated with powdered chalk, which may be detected in the following manner:—First pick out from a small quantity all the perceptible pieces of bones; weigh out half an ounce of the remainder, and about the same quantity of nitric acid; add the nitric acid to the bones, and when the effervescence has ceased, weigh the whole again,—for every grain which it falls short of the original weight, it contained twice that quantity of chalk.—*From a Lecture by T. C. Eyton, Esq. to the Wellington Farmers' Club.*

Thick Sowing.—Many farmers, I know, give a preference to the broadcast system, under the impression that a larger increase is produced, by a more distinct and regular distribution of the seed-corn. On that point their argument may be somewhat correct; for it is an axiom which I believe cannot be controverted, that where many seed-corns are deposited together, and that when their fibrous roots come into contact, many of them degenerate or wholly cease to obtain perfection. That may, however, be obviated by a drill-machine so constructed as to deposit with greater precision a fewer number of corns in the seed-cup. I have somewhere read of an experiment made in dibbling Wheat, where an inverse ratio to the number of grains placed in the dibbled holes was produced, viz.:—

8 seeds deposited in the same hole	produced	3	ears of Wheat.
7	ditto	3	,,
6	ditto	2	,,
5	ditto	3	,,
4	ditto	4	,,
3	ditto	4	,,
2	ditto	7	,,
1	ditto	15	,,

This statement may be correct, and if the agriculturist could depend on the attention required from their labour to deposit a single seed in each hole, great benefit might be the result; but where the process, I believe, is usually practised, payment at certain prices per bushel is made, and to dispose of the quantity holds out too many temptations to the seedsman. All this may be provided against by proper attention to the working of a well-constructed drill, when the advantages to be obtained are indisputable, by the facility, which should never be forgotten, is the ready employment offered to children, who may soon and easily accomplish the work well; and, by their time being employed, providing for their own maintenance, making them more useful and estimable members of society, as well as contributing to the establishment of their health and future well-doing.—*Report of the Cardiff Farmers' Club.*

Turnip Culture, deep Sowing.—As to variation of soil being an objection, I think an easy matter to disprove. On Rozelle Home farm, as is well known, there is every variety of soil, from the stiffest clay to the finest deep sandy loam. The culture of Turnip on these varied soils in so far as depth of sowing is concerned, has been invariably the same with me. In no single instance, during 12 years past, can I recollect of any disadvantage to the Turnip crop, on any of the descriptions of soils on the farm, being apparent, that could be considered as arising exclusively from the practice of sowing deep. External influences of weather or climate may have pressed more severely on some soils than on others, but the early process of vegetation has always been sure; I have never had, during the above period, a failure in the braird—any damage to the crop having occurred when it was in a more mature stage. It would have been unreasonable in me to have said, that deep sowing would always insure a good crop; what I did say, and can prove is, that deep sowing will favour its development, and secure it against evil in the most precarious stage of its growth. This truth many farmers will readily coincide with me in asserting—and they have arrived at conviction through its most legitimate channel—experience of the benefits of the system. I have positive evidence to prove that, on whatever description of soil the plan recommended by me has been followed—although the fly has been there, its ravages have been repelled, while it has dealt destruction on the crops around that were differently treated. As evidence that there is something rational in the system of deep sowing, many intelligent farmers in this neighbourhood have put it profitably into practice; while in many places over the country, in Renfrewshire and Lanarkshire, it has been tried this season on every variety of soil, and from what I can learn, with success, in so far as it has favoured rather than retarded a healthy braird. Let those who doubt only try for themselves, and I will have no fear of their future opposition. That the leaves of the plants are more strong when they emerge from the soil is also undeniable. They appear nearly in the "rough leaf"—a stage in their growth, which when they once attain, is well known to operate as a protection against the fly. As mentioned in my previous communication, the presence of the fly cannot be prevented, but they feast but sparingly on rough food, a regimen they do not seem to relish; hence the very trifling injury they do the crop. As Turnip is generally sown with us in slightly raised ridges or drills, the common process of thinning allows the root sufficient exposure.—*R. Walls, in the Ayrshire Agriculturist.* [We have been at some pains in making inquiry as to the success of Mr. Walls' system of sowing Turnip, and find that in every instance in which it has been tried its superiority has been manifest: its very general adoption this

season proves it to be in high estimation. We may be allowed to add a few words as to the *modus operandum*. It is to be understood that the manure is to be placed in the drill so as when covered its surface may not be less than three inches below that of the soil. The coulter of the sowing machine is to be placed so as to penetrate to the above depth, and deposit the seed on the top of the manure. The pressure of the roller which follows causes the earth to subside, generally about an inch and a half, at which depth it thus leaves the seed, so that, in reality, the actual depth of deposition is not so great as, at a glance, the readers of Mr. Walls' former communication would be apt to imagine. We talked over the matter with a gentleman whose experience enables him to give a correct opinion on the merits of the system, and with this explanation he thinks it more than probable its practice will be generally and profitably adopted.—*Ed. A. A.*]

Guano.—The Island of Ichaboe.—We have been favoured with the following "Remarks on the Island of Ichaboe, and the adjacent Coast of Africa," which we copy almost literally from the notes of the master of a vessel who has repeatedly visited them, and is well qualified to express an opinion on the subjects on which he treats. The island of Ichaboe, which has caused so much commotion amongst merchants, shipowners, and speculators, and which has given rise to the employment of many vessels from some of the principal ports both of England and Scotland, in this new branch of trade, is situated in 26° 13′ 34″ south latitude, a few miles (about twenty-two) north of Angra Pequina—a well determined position, which vessels bound for Ichaboe generally try to make. The main land, for several hundred miles on both sides of Angra Pequina, presents to the eye of the mariner a barren, inhospitable, and dangerous line of seacoast, lying low, though backed with high land in the interior. The strong glare arising from the arid sand and the density of the atmosphere calls for the utmost vigilance and caution on the part of the master-mariner approaching it during the night; for, if he once gets deceived, and into the current which sets upon the shore, the destruction of his vessel is inevitable. Along this line of coast there is not the slightest symptom of vegetation; indeed, it is much to be questioned whether vegetation would thrive, whatever might be the quality of the soil, as no rains fall in this region. True, there are heavy dews, occasionally falling both day and night; but the cold is so severe, for such a high latitude, during the fogs, and the sun, when it does break forth, is so powerful and scorching, that, in all probability, between these alternating temperatures and opposite extremes of weather, no vegetation could survive. The island itself is a barren, shelving rock, about a mile long from north to south, and half a mile across at its broadest part,—viz., from its south-west to its north-east point. It is bounded all round by reefs, except on its eastern side, where there is anchorage in from five to six fathoms. A portion of the island is in the form of a flat shelf, about 1100 feet long and 500 feet broad in the widest part. Upon this shelf is accumulated that deposit of guano which gives so much celebrity to the island, and which varies in depth from 35 to 38 feet. Taking the average width of the deposit at 400 feet, and assuming the average depth to be 36 feet, the total quantity of guano will be about 158 millions of cubic feet. The climate of Ichaboe, notwithstanding the effluvia of the volatile ammoniacal gases emitted from the guano, is very healthy. As one proof of its salubrity, he mentions the fact, that at a period when no fewer than thirty-five ships were lying off the island, their crews, comprising altogether not fewer than about seven hundred men, most of whom were enduring exceedingly laborious employment in that hot region, there were only five cases of sickness within his knowledge, and these were complaints or affections of the lungs. As has been already remarked, there falls during the night a very heavy dew, attended with a piercing coldness of temperature; and even during the day, if the sun's rays be intercepted, a cold disagreeable sensation was immediately experienced. On the sun again breaking forth, its rays speedily scorched the lips, and indeed the whole face and hands of every person of fair complexion; and the lips of very few escaped this tormenting annoyance. Our informant suffered the most excruciating pain in his lips, and the skin of his face and hands, from which the only relief he could find was by anointing the skin with hog's lard, in imitation of the custom of the inhabitants of the mainland, who profusely lubricate their persons with palm oil. With reference to the guano itself, the notes to which we refer express a decided opinion on the part of the writer, that the substance is not, as has been generally supposed, exclusively composed of the excrement of marine birds, which he believes to form only a comparatively small portion of the mass. He supposes it chiefly to consist of the decomposed bodies of marine birds and animals, together with the eggs of the former and the excrementitious matter of both. Amongst other facts and grounds for his adopting this opinion, he mentions the following:—He personally superintended the working or excavating of a pit of guano, 35 feet by 18 feet, and from all that came daily under his observation, he was inclined to the opinion that this barren rock had been a favourite place of resort for ages, for penguins and other aquatic birds: that myriads of them had successively deposited their eggs there, and had subsequently died on the island; and that it had also been a favourite haunt of seals and other marine animals. In working the pit the men occasionally came to a stratum of a light brown colour, and of greater levity than the strata above and below it, and embedded in this stratum they invariably found numerous skeletons of penguins, in the last stage of decomposition, and vast quantities of their eggs. Having worked through this, the men would probably come after a time to another stratum of a much darker brown, and much heavier description; and the substance composing the bulk of this stratum, when rubbed between the fingers, would dissolve like tallow and exude much more oil or fat than the first. Thoughout this dark-coloured stratum, the men occasionally found many bones and skeletons of seals nearly decomposed, and but very rarely any remains of penguins. The appearance of the stratum suggested to him the idea of a great number of seals having been washed on shore, or having lain down in this spot to die. He adds that the strata were not by any means regular in their alternations; but as a general rule, he did not find both the light and the dark-coloured strata in close succession. The pit here referred to was in the centre of the island.—*Manchester Guardian.*

Notices to Correspondents.

BARKING TREES.—*Clericus V.* asks if any of our correspondents can suggest a simple means of preventing cows from gnawing the bark of trees?

CHARCOAL.—*E. Bate*—This word applies only to charred *wood*. Charred coal is *coke*.

CLOVER SEED, &c.—*A Beginner.*—Italian Rye grass is the best substitute now. Sow gypsum broadcast in wet weather, early in spring. Soap-ashes and gypsum are both useful additions to your compost heap; the more compound you can make it the better. If you put burnt gypsum into your tank put in but little at a time, and stir it well, and it will not cake. Sulphuric acid is, however, a better material; on this, however, we must refer you to articles on liquid manure and fixation of ammonia in the two last Numbers of this Paper. You must not add lime to any manure containing ammonia, or producing it, during putrefaction. The two substances are incompatible, and lime is the stronger of the two, so that it drives off ammonia wherever it meets with it. Fresh mould and freshly-burnt charcoal powder are both good things to mix with cloacine, whether the object be to check smell or loss of ammonia.

DISEASE IN PIGS,—*Anon., Holly Bank*—Next week.

DRAIN-TILES AND CHEMICAL APPARATUS.—*Agricola.*—The notice by Mr. Cottam of the Benenden tile-machine, in our last week's report of the weekly meeting of the English Agricultural Society will perhaps serve your purpose. With regard to your second question we answer, "the former."

ELECTRO TINNING.—*M. Q.*—We have made fruitless inquiries on this subject. Probably the expense would be an insurmountable objection. Will the ordinary earthenware pans, or the glass ones now coming into use, not answer your purpose?

FAILURE IN CLOVER.—*E. T*—You must wait till after harvest, and sow Italian Rye-grass, and, if the land be in suitable condition, Clover seed on the patches, which, if the weather be favourable, will soon be covered.

FLAX DODDER—*H. F.* informs us that a field of Flax which he lately visited is being rapidly destroyed by this weed, the appearance of which there cannot be accounted for, as the seed was grown by the occupier last year, and there was no Dodder amongst it. We must suppose that his informant has been mistaken on this point. The only way to get rid of it is to use clean seed on clean ground, and that is necessarily effectual. The Clover Dodder at first is nourished from the ground, but as soon as it has laid hold of its victim, it becomes wholly parasitical. (See p. 627 of *Gard. Chron.*, 1843.)

FLOUR MILL.—*W. C.*—We have no experience. Dean's bears a high character.

GRASS SEEDS.—*Delta* says that "Arthur Young said that he had sown Grass seeds in August and September, and never failed, but on sowing them in spring he had often failed. In all modern works these seeds are recommended to be put in at spring time. Have Arthur Young's opinions lost their former worth? or is modern experience better than his? Yet even now-a-days his principles of farming are inculcated as the true ones; but his name is seldom uttered." It is, we believe, sufficiently well established that Clover and Grass seeds are surer of successful growth if sown in spring than if sown in autumn. 4 lbs. of burnt gypsum are equal in chemical effect to about 5 lbs. of the unburnt. Only, if you use the former on land, take care to spread it evenly, for if any quantity together get wetted, it will *set*, and be almost useless.

LAND SOCIETY.—*H. F.*—We do not know Mr. F. O'Connor's work. It appears to us that the purchase of land to be cultivated by the spade is a very *expensive* mode of patronising spade culture.

MANGOLD WURZEL.—*Silton.*—It is good food for sheep. It improves by keeping, and should not be used till April. We grew 600 tons last year, of which 400 must have been eaten by sheep.

POTATO WASHER.—*W. C.*—The Potato-washer that we use is a cylindrical framework 20 inches in diameter and 40 inches long, whose axle works in Ys, placed about three inches above the level of water, in a box. From this box, on one side of it, two curved arms extend; and when the Potatoes have been thoroughly washed, the chains attached to the extremities of these arms are hooked into eyes on the axle of the cylindrical framework, so that on continuing the rotatory movement it is wound up out of the water with its contents, which are thus easily removed.

SULPHURIC ACID.—*A Wiltshire Clergyman.*—It should be diluted with five or six weights of water, when used on the dunghill, and with two or three weights when to be used in the tank. Jerusalem Artichokes are not poisonous when given to pigs or young cattle along with other food; that is the amount of our experience. Thanks for your hint about referring to back Numbers.

ERRATUM.—Page 468, under the heading "Drainage," for "Charcoal is almost impenetrable," read "Charcoal is almost imperishable."

***As usual, many communications have been received too late.

Southdown Fleeces	11½	1 9½			

JAMES PEARSE, Wool Broker.

COVENT GARDEN, JULY 20.—The market has this week been well supplied with both Fruit and Vegetables, and the latter are of better quality than they were last week. Trade has also been a little brisker. Pine Apples are good and plentiful. A large quantity have been imported from Eleuthera and Nassau, in the Bahama Islands. They are of the Bird's Eye and Providence varieties, and are offered at from 2s. to 5s. 6d each They arrived in good condition, but are said to be of rather inferior quality. In the Bahama Islands they form a very large staple culture, and arrangements have been made for a periodical annual supply from these islands; three or four shipments are expected during the present season. Of Peaches and Nectarines there is a good supply, and Grapes, Cherries, and Plums, are sufficient for the demand. Gooseberries, Currants, and Strawberries, are also plentiful; some fine Melons are also in the market Among Vegetables, Cauliflowers are getting scarcer and have considerably advanced in price since our last report. Cabbages are a little cheaper, as are also French Beans. Peas are plentiful at last week's prices. Little alteration has taken place in the prices of Carrots or Turnips. Potatoes are a little dearer, as is also Celery. Vegetable Marrow is nearly the same as it was last week. Among Cut Flowers we noticed several species of Erica, Erythrina Crista galli, Ceanothus azureus, Carnations and Picotees, Verbenas, Pelargoniums, Gardenias, Fuchsias, Moss, Provence and China Roses.

FRUITS.

Pine Apple, per lb.,	4s to 8s	Gooseberries, per hf.-sieve,	1s 6d to 4s
Hothouse Grapes, per lb.,	2s to 6s	Walnuts, pickling, per bsh.,	5s to 6s

Horse Radish, per bundle,	2s to 3s	Green Mint, per bunch,	2d to 4d
Savory, per bunch,	3d to 6d	Marjoram, per bunch,	4d to 6d
Cucumbers, each,	2d to 1s 6d	Chervil, per punnet,	2d to 3d

MARK-LANE, MONDAY, July 15.

WE had a good supply of English Wheat at Market this morning, which met a slow sale at a decline of 1s. to 2s. per qr., at which reduction a large proportion remained unsold. For Foreign there was a retail inquiry; the finest old at about late prices, but common descriptions and new must be written fully 1s. lower.—Barley was very dull, but we do not alter our quotations.—Beans are again 1s. cheaper, and Peas are the turn lower.—The arrival of Oats being very considerable, little progress could be made with sales, even at 1s. below the rates of last week.

FRIDAY, July 19.

The arrivals of Wheat during the week have been good; the trade, both for English and Foreign, very dull at Monday's quotations, business being extremely limited, and confined to necessitous purchasers.—Barley is a heavy sale.—We observe no alteration in Beans and Peas.—Oats continue difficult of disposal, but there appears less inclination to press sales than there has been.

ARRIVALS THIS WEEK.

KINGSFORD AND LAY.

HOPS, FRIDAY, July 19.

SINCE last week the accounts continue to come more unfavourable; the duty, in consequence, is receding, and the market improving.

PATTENDEN & SMITH, Hop-Factors.

SMITHFIELD, MONDAY, July 15.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 8	to 4s 0	Best Downs & Half-breds	3s 10	to 4s 2	
Best Short Horns -	3 6	3 8	Best Long-wools - -	3 6	3 10	
Second quality Beasts -	3 0	3 4	Ewes and second quality	3 2	3 6	
Calves - - - -	3 8	4 4	Lambs - - -	4 4	5 0	
Pigs - - - -	3 4	4 0				

Beasts, 2604; Sheep and Lambs, 34,280; Calves, 154; Pigs, 360.

Although we are not over-supplied with good Beasts, the trade is heavy; the best Scots, &c. find, however, plently of buyers at, and in some few instances a little over, 4s per 8 lbs; there is a tolerably ready sale, too, for best Short-horns at 3s 8d; but we have a large proportion of middling quality which are not readily disposed of. Very few remain unsold. We have a full market of Sheep, and trade rules rather heavy; notwithstanding, very nearly all are sold, there being a great many bought for keeping. Our top quotations were tolerably well supported in the most selling Sheep of each description, but Ewes were very heavy on hand, there being so much choice of good Sheep. The best Lamb is rather a brisker trade, but we have a large supply of very middling quality which are very unselling. There is a pretty good demand for the best Calves at fully 4s 4d per 8 lbs.

FRIDAY, July 19.

Our supply of Beasts to-day is moderate; we cannot observe any alteration from Monday's prices; the best Scots, &c, are making about 4s, and the best Short-horns about 3s 8d per 8 lbs. Our supply of Sheep is rather short to-day, and the best qualities are readily sold at Monday's quotations. Good Lamb is rather scarce, and fully maintains its price, 5s per 8 lbs. we have much very inferior making no more than about 4s 4d. The demand for good Calves is rather brisker, and there is a small advance in the best qualities, they making 4s 6d per 8 lbs.

Beasts, 607; Sheep and Lambs, 9550; Calves, 429; Pigs, 340.

41, West Smithfield.

MANURES.—The Readers of the *Gardeners' Chro.* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones . .	p. ton	£4	10s.	0d	Nitrate of Potash	„	£1	4s.	6d

Wm. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which property is almost totally exhausted, and no two parcels of which were ever alike. They blend the other ingredients equally useful and far cheaper: the produced of inferior strength, and the improvers of all sorts, but most of the poor ones, and cannot possibly prove injurious to seed or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 20 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 11*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINDSANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings, its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed, Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained by dissolving Half a Bottle of this powder in a *quart of water*, and using a table spoonful to a gallon in watering flower-beds. *Sold in bottles*, 1s. 9d. *each*, by Chemists and Seedsmen. Agents, DAVY, MACKMURDO and Co., 100, Upper Thames-street, London.

*** "In these days of *deception*, it is due to those persons who send out a really good article, that those who benefit by it should make it known."—See Evidence of J. R. PEARSON, Chilwell Nurseries, *Chronicle*, p. 390, "*Humphreys's Compound.*"

YORKSHIRE LAND-DRAINING ASSOCIATION.—At a MEETING of the PROVISIONAL COMMITTEE held at YORK, this day, for the purpose of Allotting the Shares applied for in the Association, and on other business—

It was resolved that the number of Shares now allotted being amply sufficient to justify the Committee in proceeding forthwith to carry out the objects of the Association, the necessary Deed of Settlement be prepared for execution. And that such of the Public as may yet be desirous of becoming Shareholders, and who signify the same to the Secretary (Messrs. BLANCHARD, RICHARDSON, and GUEST, York), or to the Secretary, (Mr. CHARNOCK, Wakefield), on or before the first of July next, shall be admitted if the number of unallotted Shares be sufficient, on the same terms as the present Subscribers.

York, June 12, 1844. JAMES HAMILTON, Chairman.

FARMERS' and GRAZIERS' MUTUAL CATTLE INSURANCE ASSOCIATION. Offices, 366, Strand, London.

The especial object of this Association is to give to Farmers, Graziers, and Owners of Cattle the best means of protecting themselves against losses by those diseases and accidents which they can neither foresee nor control, but which have hitherto been most ruinous, and often ruinous to thousands.

To prevent fraud, no owner will receive in any case more than two-thirds of the *bond fide* value of the animal lost, but he will be entitled to one-third of the value of the skin and carcass.

Insurances may be effected in two ways.

1st. The Owner may have his stock valued by the Inspector of the Association, and pay upon the full amount, and receive two-thirds of the market value of the animal dying (*i. e.*, the value of it the day before the disease manifested itself). For example:—If the full value of the stock, allowing for the improving condition of the animals during the coming year of insurance (for that preceding value during that period must be calculated), amounts, or was assumed to 1000*l.*, then, the premium (100*l.*) being paid if any one of more die, two-thirds of their market value will be paid, before worth what they may.

2d. If the owner deems making his own estimate and average, he will receive two-thirds of the said value of the animal dying, provided such value be not more than the average he has specified, and when of smaller value, two-thirds of such smaller value only, the Directors having power to grant additional compensation, should they see fit. For instance:—If the stock consists of 100 head, and the average fixed be 10*l.*, then the premium to be paid will be upon 1000*l.*; and if one or more die, of the value of 10*l.* (to be certified by the Inspector), the owner will be paid two-thirds of his average (less two-thirds of the skin, &c.); if worth only 8*l.*, then two-thirds of 8*l.*, &c.; but if the animal were worth 20*l.*, he will receive only two-thirds of his average (10*l.*)

PREMIUMS.

Neat Cattle and Cows, against death by all diseases and accidents save *pleuro pneumonia* (usually called the "Epidemic") 30*s.* per 100*l.* value.

Including *pleuro pneumonia*, 20*s.* per cent. additional; being at the rate of 50*s.* per 100*l.* also. *Pleuro pneumonia* will not be taken alone at this latter rate.

Prospectuses and every information may be obtained at the Office, if by letters, post paid, addressed to WILLIAM SHAW, Esq., 366, Strand, London, or the Agents in the country.

HENRY FLOWER, Secretary.

AGRICULTURAL COLLEGE.—A PUBLIC MEETING will be held at Southampton on Wednesday, the 24th instant, at one o'clock, which will be attended by a Deputation of the Committee of Management and others, who are now engaged in the establishment of a College on a Farm, for giving a scientific and practical education adapted to Agricultural pursuits. At this Meeting, the object of the Institution will be fully explained, also the mode of carrying it into effect. The attendance of all interested in the important object is particularly requested.

PHILIP PUSEY, Esq., M.P. has consented to take the Chair.

By Direction of the Committee. ROBT. J. BROWN, Hon. Sec.

Cirencester, July 18th, 1844.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

GREAT NATIONAL CATTLE SHOW OF IRELAND.

THE SOCIETY'S THIRD GREAT AGRICULTURAL MEETING, and Exhibition of Breeding and Fat Stock, Horses, Sheep, Swine, Flax, Wool, Butter, and Agricultural Implements, &c., open for General Competition, will take place on Wednesday and Thursday, the 14th and 15th days of August next, at the COBOURG GARDENS, Harcourt-street, in the City of Dublin.

Wednesday, the 1st of August, will be the last day for serving Notices of entry for Stock, &c., and Premium Sheets, and Blank Forms of Entry can be had, on application to the Secretary, at the Society's Rooms, 37, Upper Sackville-street, by whom they will be forwarded.

All Persons desirous of exhibiting Farming and Agricultural Implements are requested to send in Lists and Descriptions of the different articles to the Secretary, on or before the 1st of August, in order that they might be published in full in the Catalogue.

THE FIRST OR COUNCIL DINNER will take place in the Round Room of the Rotunda, on Wednesday, the First Day of the Show, when the Marquess of Downshire, Chairman of the Council, will preside.

THE GRAND BANQUET will be held on Thursday, the 15th of August, in the Theatre Royal, Hawkins's-street, on which occasion His Grace the Duke of Leinster, President of the Society, supported by the different Noblemen, Vice-Presidents, and Members of the Council, will fill the Chair. The Dress Boxes will be appropriated exclusively to Ladies.

The Premiums to be distributed on this occasion will amount to upwards of ONE THOUSAND POUNDS, and every facility will be given to the Exhibitors of Stock and Implements.

The AGRICULTURAL CHALLENGE CUP, Value ONE HUNDRED SOVEREIGNS, and now held by Geo. A. Grey, Esq., by his Short Horned Bull, Recruit, will be also challenged at the Meeting.

There will be an Auction of Stock in the Show Yard after the Show.

Places at the different entertainments will be specially reserved for strangers attending the Meeting.

The Society's Annual Report for 1843, and first part of its Transactions, are now ready for distribution, and may be obtained by members free, or by non-subscribers at One Shilling a Number, on application to Messrs. Curry and Co., Dublin; Frazer, Edinburgh; and Longman, London, the Society's publishers, who are making the necessary arrangements for its circulation all through the Kingdom. By Order, EDWARD BULLEN, Secretary.

Society's Rooms, 37, Upper Sackville-street, Dublin.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT suffices where 3 or 4 inch flooring would be required. Next, in its [illegible] and even surface free from [illegible] and dusty, in comparison with a [illegible] and lastly, in economy, being less than the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BARLEY WHITE and SONS, Millbank-street, Westminster.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the city of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Gallery Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 2*s.*, 10*s.* 6*d.*, 20*s.*, and 100*s.* each, with full directions, which must be used in proportion to the extent of premises infested to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l.* to 5*l.* per annum; mansions and estates from 10*l.* and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal Joseph Anton Meyer.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleansing them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130*a*, Oxford-street, one door from Holles-street.

Caution.—Beware of the words "From Metcalfe's," adopted by some houses.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS'S Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup, giving a zest far superior to the long-established favourites, more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

SURPRISING EFFICACY of "PARR'S LIFE PILLS."

Testimonial just received by the Hibernia from America.—Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn, L.I.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion; her bowels were sometimes constipated, and at other times lax, and never regular. At this period, she was recommended to try PARR'S LIFE PILLS, when, no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.—Yours truly,

To T. Roberts & Co., April, 1844. C. STEANE.

These and hundreds of other cases of decided cures, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine vendor's. The cures in many instances were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of spurious imitations of the above Medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the fac-simile of the signature of the proprietors, "T. ROBERTS & Co., Crane-court, Fleet-street, London," on the directions.

PRESERVES and CONFECTIONERY.—The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home-made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18*s.* per Gallon, exclusive of the price of the Jar, and in Glass Bottles, at 20*s.* per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, Jun., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

TO ARTISTS, AMATEURS, ETC.

PERMANENT DRAWING CHALK in Cedar, in various Colours.

E. WOLFF & SON beg to apprise Artists & Amateurs that they have, by the introduction of great improvements in their CRETA LÆVIS, enabled it to be used the same as the ordinary pencil; and effects can now be produced equal to water-colour drawings, without the use of water or any other fluid, the various colours blending together with perfect harmony, beauty, and richness. It can be cut to a fine point, and is thus capable of giving a very delicate outline. For sketching from nature, the great advantages resulting from the adoption of the CRETA LÆVIS must be obvious, as without the use of water, palette, brushes, &c., all the various tints can be obtained with a truthfulness that cannot be surpassed, thus superseding every other method in general use.

The drawings may be carried in a portfolio with safety, as, unlike other crayons, they will neither rub off, nor suffer injury by coming in contact with the usual contents of a portfolio.

The CRETA LÆVIS will not be affected by heat or change of climate; and, by its compact form, may be carried any distance without the slightest inconvenience. To be had of all respectable Stationers, and of the Manufacturers, at the following prices:—

Leather box, containing a set of 12.... 7s. each.
— — — 18....10s. —
— — — 24....14s. —
— — — 36....21s. —
In sets as above, without box, at..... 6s. per doz.
Lake and Cobalt .....12s. —

*** May be had also in Crayons without cedar, in sets as above, at 6s. per dozen, box included.

"*Creta Lævis*—We have inspected an invention of Messrs. Wolff & Son. Creta Lævis are permanent coloured Crayons, of nearly every hue and tint, differing essentially from those in general use, inasmuch as they do not cast off, and are clearer than chalk, retaining at the same time much softness and delicacy. We think they would be found useful to the sketcher, as they are portable, not easily injured, and can be used upon white or tinted paper. We can recommend them, especially to ladies, as we have seldom seen more charming specimens of flower-drawing than those produced by the Creta Lævis: the blue, generally so coarse in chalk, was singularly clear, and many of the landscapes and heads submitted for our inspection proved that Mr. Wolff has made a valuable discovery."—*London Art Union.*

Instructions for Use.—To produce the delicate shades, the chalk must be cut to a fine point, and worked very lightly on the paper, blending the colours until the required tint be obtained. The deep shades merely require a broader point and increased pressure.—Bristol Board, Crayon paper, or, in fact, any papers with a fine even surface, not glazed, are well adapted for the CRETA LÆVIS; but tinted crayon papers are most suitable, as they add to the finish of the drawing.

WOLFF & SON beg to recommend their newly-invented SKETCHING PENCILS, or Permanent Black Chalk:—

B B, Very black, for foreground: H B, Middle tint; N, Neutral tint, for distance. Price 6s. per dozen.

These Pencils are peculiarly adapted for sketching heads and landscapes, and are capable of producing a beautiful effect with very little labour. Having an adhesive quality, the drawings may be transmitted without fear of injury.

*** WOLFF & SON are desirous of opening an Agency with respectable Country Booksellers and Stationers for the sale of the above.—Manufactory, 23, Church-street, Spitalfields, London.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

STATE LOAN of His Royal Highness the Grand Duke of Baden of 5,000,000 fls., to be reimbursed with 9,034,055 fls., in lots of 50,000, 40,000, 35,000, 30,000, 20,000 fls., &c., the smallest being 50 fls.—GRAND PUBLIC DISTRIBUTION to take place at Carlsruhe on the 1st of August next; official bulletins containing the result will be forwarded immediately to every shareholder. Price of a single certificate, 10s.; 11 for 5l.; 23 for 10l.; 60 for 25l. sterling; payable in notes, money orders, or remittances.—Apply for full particulars and certificates, without delay, to Moriz I. Stiebel, banker, Frankfort-on-Maine. To save postages, all letters addressed to Messrs. Stiebel and Co., 8, Lime-street, London, will be promptly forwarded and attended to.

ROYAL POLYTECHNIC INSTITUTION.—IMPORTANT SCIENTIFIC NOVELTY.—Dr. POTT'S PNEUMATIC mode of forming SUBMARINE FOUNDATIONS in DEEP WATER, explained in a Lecture by Dr. Ryan, on MONDAYS and SATURDAYS, at Four o'clock, with the VARIOUS INTERESTING EXPERIMENTS. On the EVENINGS of MONDAY, WEDNESDAY, and FRIDAY, POPULAR LECTURES are delivered by Dr. RYAN, and on TUESDAY and THURSDAY EVENINGS, by Professor BACHHOFFNER. The Daily Lectures are constantly varied. LONGBOTTOM'S PHYSIOSCOPE & OPAQUE MICROSCOPE. ARMSTRONG'S HYDRO-ELECTRIC MACHINE, DIVING BELL and DIVER. NEW DISSOLVING VIEWS, &c. &c. The Music is conducted by T. Wallis, Mus. Doc.—Admission, One Shilling. Schools, Half-price.

SILVER PLATED DISH COVERS.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, opposite the Bank of England, submit for choice in their Plate-rooms, many patterns of SILVER PLATED DISH COVERS, of Sheffield manufacture, from 15 to 20 guineas the set, viz.:—

The above have silver handles and mountings, and silver shields for engraving the crest or coat of arms. A price current, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

REFINED PLEASURE to LOVERS of BOTANY.—The Nobility and Gentry are respectfully informed that the splendid WARDIAN PLANT CASES, which excited so much attention and obtained a Medal at the late Chiswick Fête, are now on view at No. 33, Argyle-street, Regent-street.

The suggestions of PROFESSOR LINDLEY have been earnestly carried out by the manufacturer, Mr. POTTS, so as to elicit the entire approval of that eminent authority. The varied charms of Nature are aided by the gorgeous enrichments of Art; and the Invalid, however exalted her station, may now enjoy at all seasons the beauties of Flora, in a cabinet not unworthy places in the most aristocratic mansions.—Agent, Mr. NOTTINGHAM.

THE WORKS OF G. P. R. JAMES, TO BE PUBLISHED QUARTERLY.

On the 1st of July, in medium 8vo, neatly bound, price 8s. A NEW AND ILLUSTRATED EDITION OF

THE WORKS OF G. P. R. JAMES, ESQ.

This interesting Series commenced with "THE GIPSY," and will be followed, on the 1st of October, by "MARY OF BURGUNDY." Each Volume will comprise a complete Work, beautifully printed in a large type, and will appear at intervals of three months, the whole carefully revised by the Author, and beautifully Illustrated.

"Our readers will perceive from these general observations that we estimate Mr. James's abilities, as a romance writer, highly; his works are lively and interesting, and animated by a spirit of sound and healthy morality in feeling, and of natural delineation in character, which we think will secure for them a calm popularity which will last beyond the present day."—*Edinburgh Review.*

Detailed Prospectus and Specimens may be had on application to the Publishers, SMITH, ELDER, & Co., 65, Cornhill, London.

Agents—Bell and Bradfute, Edinburgh; John Cumming, Dublin; Simms and Dinnam, Manchester; William Grapel, Liverpool; and David Robertson, Glasgow.

FIELD LECTURES ON GEOLOGY. By JOSHUA TRIMMER, F.G.S. Author of "Practical Geology and Mineralogy." Early in August, Mr. TRIMMER proposes making a Tour for two months through the most interesting GEOLOGICAL and AGRICULTURAL districts of SCOTLAND and the North of ENGLAND, in company with a few Gentlemen desirous of acquiring in the Field a knowledge of the British series of Rocks. Fuller details will be communicated in reply to letters addressed to him at the Rooms of the Geological Society, Somerset House, London.

MR. HOARE'S NEW WORK ON THE VINE.—On Thursday next will be published, in one Vol., 12mo., price 5s. cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD OF PLANTING & MANAGING THE ROOTS OF GRAPE VINES, by CLEMENT HOARE, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."

London: LONGMAN, BROWN, GREEN, and LONGMANS; and FLETCHER and Co., Southampton.

MIND COMPLAINTS, or NERVOUSNESS.—Clergymen, Noblemen, and all who suffer from groundless fear, suspicion, inquietude, &c., confusion, blushing, despondency, indecision, irresolution, head ache, vertigo, loss of memory, delusion, inaptitude for society, study, or business, blood to the head, restlessness, wretchedness, thoughts of self-injury, &c., can now not only be relieved, but tranquillised, made happy, and cured. The Rev. Dr. WILLIS MOSELEY, late of Cambridge University, after enduring these sufferings 14 years, discovered their causes, seat, and a perfect cure; and for 25 years has had no relapse. By the same means he has cured numerous clergymen, medical men, noblemen, &c.; and of 11,000 applicants, knows not 20 uncured who have followed his advice. Numerous testimonials can be seen, and references given. Most get well in six weeks. Means of cure sent to all parts. Apply or write. At home from 11 to 3.—9, Charlotte-street, Bloomsbury.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 20, 1844.

The Newspaper.

SATURDAY, JULY 20, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.
Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, (Instituted in 1805), New Bridge-street, Blackfriars.

BONUS every THREE Years. Eighty per cent. or Four-fifths of the Profits returned on Policies effected after the 1st of May, 1844.

The new Prospectus, containing a full detail of the highly advantageous Terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

EDWIN CHARLTON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, Waterloo-place, London.
Directors.—The Chisholm, Chairman.
William Morley, Esq., Deputy Chairman.

John Brightman, Esq.
Francis Brodigan, Esq.
James William Deacon, Esq.
Jonathan Duncan Dow, Esq.
Alexander Robert Irvine, Esq.
John Inglis Jerdein, Esq.
James John Kinloch, Esq.
Henry Lawson, Esq.
Robert Power, Esq.
The Rev. F. W. Johnson Vickery, A.M.

Auditors.—C. B. Rule, Esq.; T. C. Simmons, Esq.; George Thomas, Esq.
Physician.—John Clendinning, M.D., 16, Wimpole-street.
Solicitor.—Walter Prideaux, Esq., Goldsmith's Hall.
Bankers.—Union Bank of London.

ADVANTAGES OF THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security to the Policy-Holders.

Credit given to Members for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay, and after payment of the arrears the party will become entitled to participate in the entire profits of the Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance, in the usual way.

Thus, for example—a person in the 25th year of his age, instead of paying 2*l.* 6*s.* per annum for an Assurance of 100*l.*, would be required to pay 1*l.* 3*s.* only during the first five years, when, on payment of the arrears of Premium, amounting to 5*l.* 15*s.*, his share of the Profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 1*l.* 3*s.* originally paid by him. The GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members, to be specially convened on the occasion.

Members Assured to the extent of 1000*l.* entitled (after payment of five Annual Premiums) to attend and vote at all General Meetings, which will have the superintendence and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, Managing Director.

News of the Week.

ACCOUNTS have reached Paris from Algiers announcing that another skirmish took place on the 3d inst. between the French troops and those of Morocco. Marshal Bugeaud, in his despatch to the Minister of War, states that the Moorish force in the battle consisted of about 4000 cavalry; but the infantry were so far behind, that they could not be brought to an engagement. The Moors, according to the Marshal's statement, appeared desirous of accompanying the French on their line of march without any serious engagement; but the Marshal, unwilling to permit this movement which they would have celebrated as a victory, determined on taking the offensive, and drove the enemy before him, with some loss. The engagement, however, has had no material results, because the Moors offered no resistance; but the French consider that it will secure to them a moral advantage by proving to the Moors that they are incapable of competing with French troops in a serious battle. One of the most remarkable facts in this affair is the announcement that Abd-el-Kader was present, and probably commanded the Moors. The proceedings of the French Chambers are not of much interest, being confined mostly to the details of various Railway Bills, and other topics of domestic interest. M. Thiers, as the Reporter of the Committee, has presented to the Chambers his report on the Secondary Instruction Bill, which has already caused so much excitement and angry feeling between the Church and the University. The Report is of great length, having occupied three hours in reading; and it is said to be extremely hostile to the pretensions of the clergy.—From Spain, we have the long expected decree for the dissolution of the Cortes, and for the convocation of the Electoral Colleges for the 3d Sept.; the new Cortes to meet early in October. Another decree has been published for the re-establishment of the *fueros* in the Basque provinces, subject to the inquiry of a commission under the control of the Government, preparatory to the settlement of the questions at issue in the approaching Cortes. —The warlike preparations against Morocco are still in progress, but it was believed that the differences would be arranged by the intervention of our Government. — The state of Italy, notwithstanding the failure of the late attempt in Calabria, is still the cause of much anxiety. The chief hope of tranquillity rests upon the known want of unanimity among the disaffected States, and on the absence of some powerful leader, who can command the confidence of the people, and direct their energies to one common object. The late attempt has failed, as all isolated attempts must fail in Italy, when opposed by an overwhelming military force; the brothers Bandiera and their companions have been captured, and it is said that they will be tried by a military commission.—The accounts from Greece mention a disturbance which occurred at Athens in connexion with the elections: the mob assembled under the Palace windows, and demanded the dissolution of the Ministry, and at last the troops were obliged to disperse the rioters, many of whom were killed.—From the United States the news relates chiefly to Texas, and is interesting only as confirming the previous advices that Congress have adjourned without giving the least hope that they will sanction the annexation treaty.

In the House of Lords on Monday the Dissenters' Chapels Bill gave rise to a long discussion, the Bishop of London having moved that the Amendments of the Commons be taken into consideration that day three months. The Lord Chancellor, the Bishops of Durham and Norwich, and other Peers supported the Bill, and the Bishop of London's motion was negatived by 202 to 41. The Commons' Amendments were then agreed to, and the Bill passed. In the Commons the Poor-Law Amendment Bill has been the principal subject of discussion, and the Bill has passed with few modifications. Mr. Wyse's motion for a committee to inquire into the special jury lists in the late Irish trials was negatived on Monday by 91 to 73. Mr. Duncombe on Thursday again brought before the House the subject of opening letters at the Post-office, in reference to the refusal of the committee to allow him to be present at the examination of his witnesses. A long debate ensued, and the motion for the admission of Mr. Duncombe was negatived by 141 to 51.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses continue at Windsor Castle, and are quite well.—On Saturday, the Queen and Prince Albert, accompanied by the Princess Royal, went to Adelaide Lodge in an open pony-carriage. On Sunday, the Queen and Prince attended divine service in the private chapel of the Castle. On Monday her Majesty, Prince Albert, and the Princess Royal took an airing in an open carriage; and the Prince afterwards inspected his regiment, the Scots Fusilier Guards, in the Great Park.—The Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz arrived at the Castle in the afternoon, on a visit to the Queen. On Tuesday, the Queen and Prince Albert, accompanied by the Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz, took an airing in an open pony carriage, and paid a visit to the Duchess of Kent at Frogmore Lodge. The Royal party also took an airing in the afternoon. On Wednesday the Grand Duke and Duchess of Mecklenburgh left the Castle for town, and the Queen and Prince Albert afterwards took an airing in an open carriage. On Thursday the Queen and Prince Albert took an early walk in the pleasure grounds of the Castle, and drove in a pony phaeton in the afternoon. The Countess of Mount Edgcumbe has succeeded Viscountess Jocelyn as Lady in Waiting; Lord Rivers has succeeded the Earl of Morton as the Lord in Waiting; and the Hon. Capt. Duncombe has succeeded the Hon. Capt. Hood as the Groom in Waiting on Her Majesty. The Queen has appointed the Hon. Lucy Maria Kerr to be one of the Maids of Honour in Ordinary to her Majesty, in the room of the Hon. Miss Lister.

THE KING OF SAXONY.—His Majesty on Saturday was at Bangor, North Wales, and on that night slept at the Royal Hotel, Chester. On Sunday he arrived at Liverpool, where he was received by the Mayor and other authorities. After inspecting the town, &c., his Majesty proceeded to Manchester and visited several manufactories and other objects of interest. It is said that his Majesty will leave Great Britain on the 31st inst., and embark at Granton Pier, Edinburgh, on board the Princess Alice steam-packet, which will be there in readiness to receive the King, and convey him to Hamburg.

Parliamentary Movements.—The official declaration of the poll at Birmingham took place on Monday, when there were—For Mr. Spooner (Conservative) 2095, Mr. Scholefield 1735, Mr. Sturge 346. Mr. Spooner was, therefore, declared duly elected, and has since taken his seat in Parliament.

Death of the Earl of Kintore.—The death of this nobleman took place on Thursday week at his Lordship's seat, Keith Hall, Aberdeenshire. His Lordship had been in a depressed state of mind for some time past, and last season relinquished his favourite amusement, fox-hunting, and sought to recruit his strength on the Continent. He returned some time since, after trying the spa of Strathpeffer, without any advantage. The immediate cause of his Lordship's death is stated to have been an injury received while hunting many years ago, and which, though partially cured, had left effects from which he never altogether recovered. The Earl of Kintore, Lord Falconer of Halkertown, and Lord Keith of Inverurie, in the peerage of Scotland, and Baron Kintore in the peerage of the United Kingdom, was born in 1794, and succeeded to the title in 1812. He had 4 children by his second marriage: Lord Inverurie, late Lieutenant 17th Light Dragoons, whose melancholy death while hunting, it will be recollected, took place in the early part of the present year; Lady Isabella Catharine, who also recently died from the effects of an accident; Francis Alexander, present and ninth Earl; and the Hon. Charles James, who still survive.

Foreign.

FRANCE.—Accounts from Paris state that the different items of the budget have been voted with great rapidity, and with very slight opposition. The budget of the Navy department gave rise to an interesting discussion, during which M. Billault commanded attention by stating that the late Admiral Lalande had desired him, on his death-bed, to lay before the Chamber the observations he was about to make. They related to the two questions, whether France should continue a maritime as well as a military power, and to the proportion her steam navy should have towards her sailing navy. On the second question the Admiral urged the greatest circumspection. He was convinced that the sailing navy would still be the principal force of the maritime Powers, and therefore counselled great reserve in the extension of the steam navy. He wished the Government to be attentive to the proceedings of England in that respect, and her example to be followed. He above all attached great importance to the condition of the officers and crews, and wished a squadron to be always fitted out, as being the best means of securing strength to the naval force of France. M. Billault entered into further details of Admiral Lalande's views; and after paying a tribute to the knowledge, zeal, and services of the Prince de Joinville, said that his Royal Highness had suffered himself to be dazzled by powerful innovations, which would not however produce a revolution in naval ascendancy. — Important advices had been received from Oran of the 6th of July. On the 3d another engagement took place between the French troops and those of Morocco, within the Moorish territory. A considerable body of Moors, who had been dispersed in the affair of the 15th, had reassembled, and appeared to wish to provoke the French general to attack them. Marshal Bugeaud sent a body of his troops against the enemy and dispersed them. There was no doubt that Abd-el-Kader commanded. The Marshal in his despatch states that several Moors were killed, and a few horses captured; but the infantry was so far behind he could not engage them. "This engagement," he adds, "has had little or no material results, because the enemy offered no resistance, and we had only to encounter its cavalry; but it secures to us a considerable moral advantage. We shall have once more proved to the Moors that we do not dread war, and that they are incapable of competing with us in a serious engagement." — The Gibraltar papers of the 26th ult. state that, in the morning of that day, the Vesuvius British steamer sailed for Tangiers for the purpose, it was said, of taking on board the English Consul-General, and conveying him to Mogador. The Consul was commissioned by his Government to hand to the Emperor a sealed despatch, brought to him by the Prometheus steamer.—The papers dwell upon the recall of Rear-Admiral de Moges from the command of the station of the Antilles and Gulf of Mexico; and, referring to the occurrences at St. Domingo, represent it as a disgrace arising from political motives, similar to those which lately induced the French Government not to approve of the proceedings of Admiral Dupetit Thouars in the Pacific; but an official article in the *Messager* of Sunday evening affirms that Admiral de Moges had held his command three years, and had repeatedly expressed the wish to return to France.—The papers describe the religious ceremonies observed in the presence of the royal family on the anniversary of the death of the Duke of Orleans, and the christening of the Duc d'Alençon, the infant son of the Duke and Duchess of Nemours, who was born on Friday last. The young prince was named "Ferdinand-Philippe-Marie." The ceremony was performed by the Archbishop of Paris, in the presence of the King, Queen, and royal family, including the King and Queen of the Belgians. The godfather of the young prince was the King of Portugal, represented by his Ambassador in Paris. The Princess of Joinville acted as godmother for the Duchess of Saxe Coburg Gotha, mother of the Duchess de Nemours.—The proceedings of the Chambers are not of great importance, being confined mostly to the Railway Bills. The Paris and Lyons Bill has been adopted by the Peers by a majority of 75, and the Deputies, after uniting with the Peers in rejecting the additional article added to the Orleans and Bordeaux Railway Bill, whereby no members

of the Chamber were to contract for, or be directors of any railroads contracted for with the Government, have passed the Bill by a majority of 195 to 105. The Paris and Nantes Railway Bill has also been passed. The committee of the Chamber of Deputies, to which the fifth election of M. Charles Laffitte for the borough of Louviers was referred, has reported that the offer of M. Laffitte for the branch railway to Louviers having been withdrawn, there is no longer any reason why he should not be admitted to take his seat.—On Saturday M. Thiers presented his report to the Chamber on the Secondary Education Bill. The report, which took three hours in reading, is very hostile to the pretensions of the clergy.—Marshal Soult has been very ill but is a little better; he left Paris on Tuesday last for St. Amand, his residence near Toulouse, where he will remain for a month.—The papers devote a large portion of their columns to reports of the trial at the assizes of Auch on the 10th inst., of another Madame Lafarge—a handsome widow of twenty-six, named Madame Lacoste, who was accused of having, with the assistance of an old schoolmaster, her accomplice, successfully administered a dose of arsenic to an old husband, whose fortune she had thereby got possession of. This affair presented every feature that could excite "emotions," and the beauties of the Department of the Gers thronged the Assize Court with as much eagerness as the Parisian ladies do on such occasions. There were physicians and chemists summoned by both parties to analyse the remains of the late M. Lacoste, and to prove that they had or had not found arsenic in them. The widow is so young and so handsome, that, with the reputation she has thus acquired, the *Courrier Francais* predicts that she has every prospect of shortly becoming a woman of fashion. The trial lasted four days, and during its progress, it was stated that Madame Lacoste had already 68 suitors. Some of these personages were examined, but no light was thrown on the charge, and at the end of the fourth day both the prisoners were acquitted. So great was the interest excited by the trial that the Paris papers ran expresses on the occasion, in order to anticipate the mail.—The Lyons papers say that several persons have been arrested, charged with a Fieschi plot against the authorities of that place. Several grenades were found in their possession, with which, it is said, they intended by a single discharge to destroy the general in command, the mayor, and the prefect, when coming out of the church of St. John, after the solemn mass of the 1st of May.—The report of General Paixhans on a credit of 1,662,000f. for the construction of three steamers between Calais and England, was distributed last week in the Chamber of Deputies. The *Débats*, in mentioning this fact, says—"The English have at present for Calais and Ostend eight steamers, which altogether have 650 horse-power. They have given to some of these packets engines of a very superior description, and have placed them under the direction of the Admiralty. The Princess Alice, of 140 horse-power, crosses the Channel in 130 minutes, with wind and tide against her. France has on this line but three steamers, together of 160 horse-power. They are old crazy vessels, often obliged to demand the assistance of the English steamers, when the sea is high, to take over our despatches.

SPAIN.—A telegraphic despatch from Bayonne, of the 13th inst., announces the dissolution of the Spanish Cortes, and the establishment of the Fueros. It states that "the Cortes are dissolved by a decree of the 4th, inserted in the *Gazette* of the 10th. The Electoral Colleges are convoked for the 3d September. The general ballot is to take place on the 14th. The new Cortes are to meet on the 10th October. Another decree of the 4th re-establishes in the Basque provinces the deputations and municipalities according to the Fueros. The general juntas are to assemble shortly, and to appoint commissioners to settle with the Government the question of the Fueros, which shall be submitted to the approaching Cortes. Nothing has been changed in the Customs, or in the Administration of Justice and the Police. A third decree orders the removal of the remains of Montes de Oca from Vittoria to Madrid."—The regiment of Gallicia, which forms part of the force destined for Morocco, had marched that morning for Andalusia. Several young men had joined as volunteers. The cavalry reg. of Talavera was to march from Madrid for the same destination on the 8th inst. Between 6000 and 7000 men had been ordered to proceed from different points to that harbour, where they were to be embarked for Ceuta. The funds declined in consequence of the warlike preparations in progress, but it was believed that the differences would be made up by the intervention of our Government. The *Gazette* of the 9th contains two Royal decrees, one annulling the tobacco contract, according to the agreement entered into on the 15th June, and the other sanctioning the convention whereby the bank of Saint Ferdinand has consented to advance 60,000,000 reals de vellon to the Treasury in the present month of July. It is stated on the authority of advices from Barcelona, that the Queen will cease to take baths on the 15th, and that, after resting for four or five days, her Majesty will embark for Valencia, where she will stop but a few days. If this information be correct, it is probable that the Court will return to Madrid by the end of this month.

GERMANY.—The Berlin papers publish the new convention between Russia and Prussia, which was concluded on the 20th May, and will be put in force in August next. By this convention Russia and Prussia mutually engage themselves to give up deserters from the army it demanded within two years. Criminals are also to be given up, but in the case of crimes, they are only to be given up when the crimes of which they are accused are punishable by the laws of the country in which they have taken refuge. Foreigners are not to be given up.—The *Augsburg Gazette* says that the notification of the death of the Duke of Angouleme, sent by the Duke of Bordeaux, was refused by England and Sweden. The other Powers simply acknowledge receipt of it.

BELGIUM.—The correspondent of the *Times* states that recruiting for the service of the Emperor of Morocco has been going on in Belgium, and is one of the most extraordinary affairs of the present time. He says, "It is a positive fact that men have been enrolled and officers named, but upon what authority we are ignorant. Among the names mentioned as connected with the proceeding are those of General Le Charlier, Colonel Parent, Captain Cornelis, Lieutenant Verbruggen, &c. The enrolling has been to a considerable extent. The recruits, &c., were instructed to repair to Hamburgh. On these particulars you may rely, but I do not mean to assert that the Emperor of Morocco has authorised the proceeding. Neither do I mean to charge the parties I have named with anything criminal or dishonourable. I only state that those names are mixed up with this inconceivable transaction."

ITALY.—A letter from Bologna, of the 4th, states that the Military Commission sitting there has passed sentence on the third batch of prisoners implicated in the political events of 1843. The sentences had been forwarded under seal to Rome, and the *exequatur* was daily expected. These prisoners consist of 40 persons, some of them of the higher ranks of society. It is said that none are to be condemned to death but those who have effected their escape to foreign countries, and are condemned in default of appearance. Official accounts have been received of the seizure of the Italian emigrants, who left Corfu for Calabria. It is said that their intention was to disembark in Sicily, but being pursued by an armed ship, they were under the necessity of landing at Pizzo, the place where Murat failed in his famous expedition. The prisoners were to be tried by a Military Commission. The two sons of Admiral Bandiera and Lieutenant Moro, who had also deserted the Austrian Navy, were captured, but the latter was mortally wounded.—It is stated in letters from Turin that the railway between that city and Genoa, with two branches between Venice and Milan has received Royal sanction. It is to be executed at the expense of Government, and the Council of State have given directions that it shall be immediately marked out.—Mr. Charles Dickens (Boz), has left England with his family for Genoa, where he has taken a house, and purposes to make a residence of some months' duration in Italy.

RUSSIA.—We learn from Berlin, July 5, that intelligence had just been received there from St. Petersburg, announcing that the Grand Duchess Alexandra had been delivered of a dead child, and had received the last sacraments, the physicians having declared that no hope was left. The same letter states that the Court of Russia had gone into mourning for twelve days on account of the death of the Duc d'Angoulême.

GREECE.—The accounts from Athens of the 30th ult. describe Greece as on the eve of becoming again the theatre of party strife. A few days previously some rioting took place in that capital. Cries of "Down with the Ministry!" and "*Vivat* the Constitution!" were vociferated under the King's windows; and Callergi was obliged to order a body of cavalry to disperse the mob. Several persons were wounded in the affray, two of whom subsequently died. The elections were nearly over in the provinces, and had passed off quietly, except in Messenia, where five individuals lost their lives. On the 29th the list of the senators, 36 in number, was published. Coletti, Mavrocordato, and Metaxa, would not permit their names to be enrolled on the list, which included the most eminent personages who have taken part in the political events of the last 25 years.

TURKEY AND EGYPT.—Accounts from Constantinople of the 27th ult. state, that the intelligence received by the Government from Albania continued to be of a satisfactory nature, and that the Greek Archbishop was assisting the Mussulman authorities in preparing an inventory of the losses suffered by the peaceable inhabitants, and for which they were to obtain compensation. On the 25th Sir S. Canning repaired to the imperial palace of Beylerbey, and presented to the Sultan an autograph letter of Queen Victoria, conveying the expression of her sincere thanks for the concessions lately made in favour of the Christian population of his empire, concessions which would tend to cement the good understanding already existing between their respective Governments. His Imperial Majesty received the letter with evident marks of satisfaction, and reiterated the assurances he had given to Sir Stratford at the previous interview. Private letters add that the news of the Emperor Nicholas's visit to England produced surmises of an anxious character in the minds of the Turkish Ministers; they considered it might have reation to proposals for an extension of the Greek territory, and further steps in favour of the Rayah population in Turkey—proposals to which England might feel inclined to listen, from the angry feelings which had been engendered by the late religious question. In this point of view, it is said, the autograph letter from our Queen was received with much welcome.—Advices from Alexandria, of the 26th ult., announce that Sir H. Hardinge, the new Governor-General of India, arrived there in the Geyser steamer on the 22d. His Excellency was received with all the honours due to his rank. The Pasha hastened to place at his disposal his Palace situate outside the city, of which he, however, did not avail himself. On the 24th he had a long audience of Mehemet Ali and dined with him, and next day set out for Cairo on his way to Suez, where he was to embark for India in the Hindostan.

UNITED STATES.—We have accounts from New York to the 26th ult. by the ship Garrick, and to the 30th ult. by the mail steamer Acadia. Of general news there is little of importance. The marriage of the President of the United States to Miss Gardiner, daughter of Colonel Gardiner who perished in the explosion of the steam-frigate, is the only incident in public affairs since the adjournment of Congress. The New York papers contain a letter from Capt. Elliott, British Charge d'Affaires at Texas, to the Hon. A. Jones, Secretary of State of that Republic, dated Galveston, April 3, in which the former urges Texas to abandon the annexation project, and seek a permanent settlement of her difficulties with Mexico, of the attainment of which desirable consummation he expresses himself as highly confident. He also replies to various objections which appear to have been made by Mr. Jones in a previous portion of the correspondence of which this letter forms part, in respect of the apparent indisposition on the part of Mexico to entertain any negotiations for such settlement, explaining, that it was the natural consequence of the proposal of annexation being made at the moment when Texas was negotiating with Mexico, "first an armistice, and then a peace." He concludes with expressing a renewed declaration of the desire of Her Majesty's Government to obtain the adjustment of the dispute between the two countries upon terms of honour, justice, and advantage to both, and the opinion that the preservation of Texian independence is her people's best security for their ultimate prosperity, both political and commercial. This correspondence is the chief subject of comment in the American papers, which declare that the whole question is, whether American or English politics shall prevail; and some even assert that "not only Texas but the whole boundless continent, is theirs, and must be theirs." Congress, however, adjourned without sanctioning or giving the least hope for a future confirmation in regard to the annexation of Texas, and the United States Senate, at the same time, has given a death-blow to Mr. Tyler's hopes for its support, in case the next presidential election should come before that body, by refusing the greater part of his recent appointments.

Parliament.

HOUSE OF LORDS.

Friday.—After the discussion on the Gaming Committee noticed in our last, the House was occupied for some time with a series of questions by the Marquess of CLANRICARDE as to our Indian policy, the annexation of Scinde, and especially the purpose with which a large army had been assembled upon the frontiers of the Punjab.—Lord RIPON assured the House that there was no foundation for the report that such an army had been assembled at all, much less that Sir C. Napier had been appointed to its command, or that it was destined to invade the Punjab. The anarchy of that country, indeed, and the apprehension that its disorganised army would make some irruption either upon our territory or that of our allies the Sikhs, rendered the presence of a strong force necessary, but there had never been any such ungenerous intention entertained as that of taking advantage of the troubles in the East to extend our dominion there. The rumour of a further acquisition of country upon the banks of the Indus was equally without foundation. The noble lord then moved that the House resolve itself into committee upon the Bank of England Charter Bill, and entered into a full explanation of the principles upon which it was founded, and the objects it was intended to promote.—Lord MONTEAGLE and Lord ASHBURTON expressed, though with several reservations, a general approval of the measure.—Lord RADNOR said he despaired of ever overcoming the chief difficulties in the currency question until the existing Corn-Laws were repealed.—The Bill, however, passed through committee without amendment.

Monday.—Lord BROUGHAM complained of being "scandalously and audaciously libelled," and again denied that he ever had intended to appropriate 20,000 a-year out of the Judgeships originally contemplated under the Privy Council Bill.—The Birkenhead Docks Bill was read a third time and passed, after a strong opposition from the Marquess of SALISBURY.—The Bank Charter Bill was read a third time and passed.—The LORD CHANCELLOR, in calling attention to the Amendments of the Commons on the Dissenters Chapels Bill adverted to the anticipated opposition, not to the amendments which would be perfectly consistent, but to the principle of a Bill which had received the sanction of both Houses of Parliament. He hoped that their lordships would confine themselves to the real question before them, which was their agreement or disagreement with the amendments, and intimated them not to put such a slight on the House of Commons as to seize the present opportunity to reject a Bill which, in both Houses, had been passed by large majorities.—The Bishop of LONDON admitted that he was taking an unusual course, only to be justified by the urgency of the case. In opposing the Bill at this final stage he had not brought forward pertinacious, but as all the arguments urged in opposition to the Bill remained unanswered, pertinacity became a virtue. After arguing at considerable length against the Bill he moved that the amendments of the Commons be taken into consideration that day three months.—The Bishop of DURHAM spoke in favour of the Bill, which he considered as a measure of justice, from which no evil effects could flow.—Lord BROUGHAM argued that the Commons' amendments were [illegible] improvements on the Bill, and professed himself unable to discover any reasonable ground for their rejection.—The Bishop of NORWICH spoke of the Bill which was based on the principle of doing as we would be done by.—The Earl of RODEN opposed the Bill at some length, contending that, if passed, it would be a breach of faith to [illegible]. Little did he think, some five or six years ago, when opposing, with the present Lord Chancellor, the measure of spoliation known as the "Appropriation Clause," such a measure as the present would be brought in by those calling themselves Conservatives.—Lord COTTENHAM observed that the measure was strictly conservative in its principle, as it went to protect those in the possession of property which was theirs by prescription and use, and to which no other body could substantiate a claim.—Lord LYNDHAM, the Earl of GALLOWAY and Lord LYTTELTON opposed the Bill, and on a division their speeches.—For the Bishop of LONDON's amendment, present and proxies 41; against it present and proxies), majority, 11. The Commons amendments to the Bill were then agreed to, and the House adjourned.

Tuesday.—Lord MONTEAGLE obtained leave to bring in a Bill to regulate such Act Companies as possessed charters, and to give to those that had not, provided they were approved by the Board of Trade, an equal legality.—Earl FORTESCUE adverted to the circumstances which led to the dismissal of Mr. O'Driscoll from the

commission of the peace in the county of Cork, and asked what were the reasons which led the Lord Chancellor of Ireland to restore a gentleman who had so manifested his unfitness for the duties of a magistrate?—Lord WHARNCLIFFE would not defend the conduct of Mr. O'Driscoll which led to his removal though many of the circumstances admitted of palliation, and had been much exaggerated. But a memorial, signed by the lord lieutenant of the county, by five other noblemen, by a large number of magistrates, and by 2810 persons of opposite opinions in religion and politics, had been presented, praying for his restoration, and the Irish Chancellor, feeling that he had been sufficiently punished by his degradation from the commission during six months, considered that he ought to be restored.—A lively debate ensued, turning mainly on personal points, and shared in by the Marquess of NORMANBY, the Marquess of CLANRICARDE, the Earl of BANDON, Lord CAMPBELL, the Earls of GLENGALL, WICKLOW, RADNOR, and MOUNTCASHEL, and the LORD CHANCELLOR who defended Lord Chancellor Sugden, when the motion for the production of any correspondence or papers relating to the case was agreed to.—Lord WHARNCLIFFE moved the re-committment of the Charitable Donations and Bequests (Ireland) Bill, which he said he had endeavoured to amend in such a manner as to satisfy—if it were possible to do so on any question—the minds of the people of that country. The principal of these amendments were the erasure of the word "Ministers"—a designation which gave great offence to Dr. MacHale, as applied to Roman Catholic priests, and the substitution of the Master of the Rolls in the room of the Lord Chancellor on the commission, which is now to consist of the Master of the Rolls, the Judge of the Prerogative Court, and ten other persons, five to be Protestants and five Roman Catholics. The amendments having received the general approbation of their lordships, were agreed to.

Thursday.—On the motion of Lord CAMPBELL, it was agreed that counsel be heard on the part of Mr. C. H. Russell against the Gaming Actions Suspension Act Continuance Bill.—The Detached Parts of Counties Bill was read a second time.—Lord BROUGHAM moved the second reading of his Aliens Bill. He stated his object to be, to leave the law as it stands with respect to the exclusion of aliens from Parliament and the Privy Council, but to naturalise the children of women who are British-born subjects by foreign husbands; and also to naturalise the foreign wife of a natural-born British subject. The Bill was read a second time.—On the motion of Lord MONTEAGLE, the Art Unions Bill was read a second time.—The LORD CHANCELLOR brought up the report from the select committee on the Insolvent Debtors' Release Bill, and urged their lordships to expedite its passing, as it would put an end to the suffering of debtors imprisoned for debts under 20*l*. It was then ordered that the Bill be committed next day.—The Earl of MOUNTCASHEL brought forward a charge of breach of trust against the Charity Commissioners in Ireland in their dealing with the Clonmel Endowed School, and moved for a select committee to inquire into their management of the funds arising from this school.—Lord WHARNCLIFFE and the Duke of WELLINGTON both treated the matter as a question of breach of trust, which ought to be referred to an investigation in Chancery, and recommended that the facts should be brought under the attention of the Irish Executive.—The LORD CHANCELLOR having shown that it was a matter for the Irish Court of Chancery and not for their lordships' House, the motion was negatived.—The Customs Duties (Isle of Man) Bill was read a third time and passed.—The Linen Manufacture (Ireland) Bill went through committee.

Friday.—The Royal Assent was given by commission to the Bank Charter Bill, Property Tax Exemption Bill, Dissenters' Chapels Bill, Customs Duties (Isle of Man) Bill, County Rates Bill, Militia Ballot Suspension Bill, Stock in Trade Assessment Bill, Paupers Removal (Scotland) Bill, Parishes (Scotland) Bill, Prisons (Scotland) Bill, Loan Societies (Ireland) Bill, Turnpike Roads (Ireland) Bill, Manchester and Ashton-under-Lyne and Staley Bridge Railway Bill, Taff Vale Railway Bill, Colchester and Ipswich Railway Bill, South-Western Railway Amendment Bill, Liverpool Docks Bill, Birkenhead Docks Bill, Southampton Improvement Bill, Coventry Improvement Bill, York Gas Light Company's Bill, and several Road and Estate Bills.—Mr. E. James, counsel for Mr. Russell, was called to the bar, and addressed their Lordships against the Gaming Bill. When he concluded, Mr. Russell was called and examined by Lord BROUGHAM—I am the attorney in the *qui tam* actions. I was instructed by my clerk; he is my brother; he has a salary of 80*l*. a year; I brought about 34 actions. He did not instruct me till I first suggested to him to do so; I expect he will pay me; I do not expect he will pay the entire. The expense of one of those actions, if lost, might be about 100*l*. A gentleman paid 90*l*. towards the expenses. I do not know him; he did not instruct me. I decline to tell who he is, because that was communicated to me as an attorney. He is not my client. I know his name, but I decline to give it.—Lord BROUGHAM: No privilege will protect a man who is not your client. Come, give the name.—The LORD CHANCELLOR: If you do not answer that question, you will reflect on the consequences.—Witness: I decline to answer, because it was a privileged communication.—Lord BROUGHAM: Did you know the name from any one independent of your client? Mr. Russell—I knew it from my client first; but I knew it from other sources.—(A laugh.)—To the Lord CHANCELLOR—Never had any communication with the person who paid this money, except in the presence of his brother, and thought that he was justified in refusing to give the name of that person.—Lord BROUGHAM told the witness that he was not privileged as to the unknown person, and must consider the consequences. The Committee had no power to commit him, but the House had.—The Duke of RICHMOND asked had he not advised his brother not to bring the action in his own name, because his character was so tainted? Answer—I think I did.—Lord BROUGHAM submitted to their Lordships that as the person at the bar admitted that the person whose name he withheld was not his client, he could not refuse to give the name.—After some consultation, the counsel and the witness were ordered to withdraw from the bar; and the witness was peremptorily ordered not to leave the House.—A conversation ensued of some length, in which several Lords took part, respecting the course to be pursued; when it was resolved that the witness Russell be ordered to attend at the bar on Monday, and that in the meantime his evidence before the Select Committee and the House be printed.—The witness was called in, and ordered to attend. He said—"I will obey your Lordships."—(Several Peers exclaimed—Oh, of course you will.) On the motion of the Duke of RICHMOND, the further consideration of the Bill was postponed till Monday.—The LORD CHANCELLOR called attention to a report which had appeared in the Irish papers, and which had originated in a report or commentary in the *Morning Chronicle*, referring to the discussion in their Lordships' House on the writ of error, the Queen *v.* O'Connell. He did not impute to the writer of that article any bad motives; he believed that the paragraph personally offensive to himself arose from ignorance of the law on the part of the writer. The Noble and Learned Lord here read the article alluded to from the above-named journal. The paragraph imputed to the Noble and Learned Lord that he admitted the jury list on the trial of the traversers had been fraudulently made up, for the purpose of prejudicing the trial. He had said nothing of the sort.—Lord BROUGHAM said the misrepresentation was very gross, but it arose from misapprehension in persons not acquainted with the technical language of the law.—After a remark from the LORD CHANCELLOR, Lord CAMPBELL said that when the subject of the trials came before the House in its legislative character he should certainly contend that the Attorney-General for Ireland had not conducted the case in a proper manner.—Messengers from the House of Commons brought up the Oaths (Ireland) Bill, the Farm Buildings Bill, and two or three others. [Left sitting.]

HOUSE OF COMMONS.

Friday.—In the debate on the Poor law Bill, of which we gave the commencement last week, the 24th clause, relating to expenses incurred for insane paupers, gave rise to some general discussion on the state of the insane poor throughout England.—Lord ASHLEY, who, with some other gentlemen, has for some time been occupied in a commission of inquiry into the condition of lunatics, said that in England and Wales there are 17,000 lunatics, and accommodation only for 4500. In Wales, this accommodation was especially deficient: and the pauper lunatics in that principality were kept in the most miserable state, in sheds, in outhouses, and in receptacles under ground. He intended shortly to bring this subject before the House, with an especial view to the making of some provision for the care of lunatics in the first stage of their disease, it being generally practicable to effect their cure when undertaken early.—Sir J. GRAHAM fully felt the great importance of this subject, and the necessity for the speedy consideration of it by Parliament.—Mr WAKLEY insisted upon the importance of an early treatment in cases of lunacy.—The 27th clause relates to burials of paupers, the expenses of which it enables the Boards of Guardians to defray from the poor-rates, although the death may have taken place out of the workhouse.—Mr. WAKLEY wished the clause to be postponed in order that means might be provided for meeting urgent cases, without the delay interposed by the necessity of consulting the guardians. It often happened that several living persons were lodged in one small room with a dead body, and that their health was most injuriously affected by its rapid decomposition.—Sir J. GRAHAM objected to postpone the clause, but was understood to say that the relieving officer would be authorised to take order for the burial without previous reference to the guardians.—Clauses 28 to 34, relating to the subject of auditing accounts, raised some discussion on the propriety of transferring the appointment of auditors to the commissioners, and on exempting unions under Local Acts from the operation of their provisions. The clauses, however, were passed, after two divisions, without alteration and the chairman reported progress.—The Actions for Gaming Discontinuance Bill was read a third time and passed, after the promise of an apology from Mr. CHRISTIE to the Duke of RICHMOND, for the unfounded charge made on a former occasion by the hon. Member against his Grace in reference to this Bill.—Sir J. GRAHAM obtained leave to bring in a Bill to provide for the better administration of criminal justice in Middlesex; and another Bill to improve the laws relating to the burning of farm buildings. He stated the object of the Bill to be, to include the firing of certain detached buildings with the crime of arson, which, under the present defective state of the law, was not the case.

Saturday. The House met on Saturday at one o'clock. The original object of this meeting of the House was to discuss the Railways Bill in committee.—Mr. GLADSTONE, however, intimated that he was in communication with the directors of the leading railway companies in the country, with a view to the adoption of certain amendments. The committee on the Bill was therefore postponed till Thursday.—The Poor-law Amendment Bill was substituted, and a discussion of several hours took place on the 35th or education clause—the only one that was carried.—Colonel Wood desired the postponement of the enactments authorising the combination of parishes or unions into school districts. He objected to the collection of great numbers of children into large schools, notwithstanding the alleged success of the experiment at Norwood; and urged the superior advantages of those schools where the children were kept in connexion with their parents.—Mr. W. COWPER vindicated the collective system, and insisted on the success of the Norwood institution.—Sir J. GRAHAM explained that no district was to include any parish of which any point would be more than 15 miles distant from any other part of such district. The districts would be so narrowed, that the children might be visited by their parents and friends on Sundays and holydays. This system was strongly recommended in the reports of several Committees. By establishing, within a few miles of the metropolis, four or five institutions like that at Norwood, the best education, physical, moral, and religious, would be provided for the pauper children in the workhouses of London, of whom there were now 8000 requiring education. These enactments had been prepared in a spirit of liberality and complete toleration, and he trusted that they would not be postponed.—Mr. WAKLEY enlarged upon the ignorance of the lower orders of his countrymen, and upon the importance of educating them. To the neglect of their education he ascribed the late incendiary fires in Norfolk and Suffolk. Education ought not to be undervalued because some educated men were blockheads. It certainly seemed to him ridiculous enough to see what sort of persons were sometimes styled "learned gentlemen;" and he thought much harm was done by calling a very stupid person "the learned gentleman." The present workhouse schools would not effect the necessary objects for the poor; and he trusted that Sir J. GRAHAM would relax none of these clauses.—Mr. WODEHOUSE said, that incendiarism was not peculiar to Norfolk, and that no man was more capable of giving an opinion about it than Mr. Wakley himself—in allusion to the burning of Mr. Wakley's house some years ago, and a trial thereon.—After the clause had been carried, and the House resumed, Mr. WAKLEY rose, labouring under very painful emotions, and entered into a statement of the whole particulars connected with this incident of his life. After stating that he had been nine years in that house, and had never given any one member occasion to complain of his having made use of observations personally offensive, he said, "I have had during life some difficulties to contend with. I came to this town some years ago an unknown man, and have had to fight my own battle, not always an easy one. I have a family of children, sons." Here the hon. member was deeply affected, and paused. On overcoming his emotion he proceeded. "I have now to demand from the hon. member for Norfolk (Mr. Wodehouse), an explanation of an observation which fell from him in the course of the committee, in answer to some remarks of mine. The hon. member said, 'No one is more capable to give an opinion on the subject of incendiarism than the hon. member himself.' It seems too horrible to suppose that these words could be applied personally to me. It seems too horrible to believe that any hon. member of this house, without being provoked by any remarks which I had made, should have applied such an observation to me. Every man who, like myself, has been engaged in the work of reform, must have made some enemies. Yet I trust that I never fought the battle unfairly. At all events, I court the most scrutinising inquiry into the whole of my private life, from the first hour of my existence to the present moment. My public life is known, but if any gentleman feels an interest in the matter, and is desirous of making an investigation into my private life, I will give him every facility in my power for pursuing the inquiry in the most minute manner. The hon. member's observation has been publicly made in the face of the first men in the kingdom sitting in this House; and if I did not dare to demand an explanation of the words used by the hon. member, I should not dare to enter within these walls again. (Loud cheers.) I could not face a body of high-minded and honourable men, if I was not prepared for the most scrutinising investigation into every circumstance to which the hon. member's words might be supposed to refer. (Cheers.) I fear nothing from inquiry—everything from insinuation; and the insinuation, when made, is the foulest calumny. There is now but one proper course for me to pursue. I do not pretend to make this a matter of private quarrel or dispute; but I ask the hon. Member what meaning he attaches to his words, when he applies them to me? and before he gives an answer to the House, I will state the circumstance to which I believe it is likely they may refer. I had the misfortune to be attacked in my own house; my house was burnt. I brought an action against the insurance office, which resisted my claim; and every farthing for which I was insured was given me by a jury, Lord Tenterden being the judge (cheers), and after the trial, one of the jurymen, who was himself a proprietor of the insurance company against which I proceeded, joined my friends in a subscription to pay my extra expenses as between attorney and client. All this was stated in the newspapers at the time, but, as I have been most shamefully and cruelly used by persons casting out insinuations against me, I do trust that the House will feel that I have not now unnecessarily interfered. It is with the greatest possible reluctance and pain that I make this appeal. I do not throw myself on the humanity of the House, but on its sense of justice; and I entreat the hon. Member to state the meaning which he attaches to the words he has used when applying them to me, and I call on him, for my sake, not to shun the matter; but if he knows aught about me of a reproachful nature, or if the slightest suspicion injurious to my character has reached him, from any source or channel, I call on him, in justice to me, to state the circumstance without reservation to the House." (General cheering.)—Mr. WODEHOUSE said—"I rejoice that I have afforded to the hon. gentleman an opportunity of giving a distinct explanation with reference to the matter to which he has just adverted. That subject has remained too long in doubt, and I have no hesitation in saying that I distinctly referred to the transaction to which he has alluded. After the explanation which he has made, it is my bounden duty to the hon. gentleman to tender him an apology, and I do so on these grounds, and on these grounds alone:—I understand that here, in the face of the House of Commons and the country, the hon. gentleman has declared that there is not one single circumstance respecting that matter which was not brought to a satisfactory conclusion, and I tender him my apology on these grounds, and these grounds alone. I must be permitted to go a step further, and to tell the hon. gentleman, and those with whom he is in the habit of acting, that they are too lavish in their imputations of selfishness against the landlords and their tenants, and every person connected with them; and I take this opportunity of declaring that these aspersions are such as we can bear no longer. I do not think it necessary to make any further explanation, and I trust the House is satisfied with what I have now stated."—There was a short pause at the conclusion of the hon. gentleman's observations, which were received by the House in silence; but, as no one rose, the SPEAKER at length put the question, that the House resume the committee on the Bill on Monday, which was agreed to.

Monday.—The House sat at 12 o'clock.—The 36th clause of the Poor Law Amendment Bill was agreed to in committee, after three hours and a half's debate, and a division. Progress was then reported.—Mr. WODEHOUSE, adverting to the accusation he had preferred on Saturday against Mr. Wakley, expressed his regret for having given him pain, and said that if his apology had not been deemed sufficient, he wished now to make it in the fullest and most ample manner.—Sir R. PEEL said—"With respect to what has fallen from the hon. member for Norfolk with reference to an insinuation which he made against the hon. member for Finsbury, I feel that the explicit declaration which has now been made must have convinced every one that the hon. member for Finsbury is an honourable and an innocent man (hear, hear), and I think that hon. gentleman may retire from the House to-night with a full understanding that he has had complete reparation made to his injured feelings, and that he retires with as much right to hold himself perfectly erect in public estimation as any hon. member. I must say, too, that as this explanation is in unison with the unanimous feelings of the House, I move that it be put on the records of the House as a public declaration." (Cheers.)—Mr. WAKLEY then said—"I cannot refrain from expressing my gratitude to the hon. member for Norfolk for the kind explanation which he has given, and offering my grateful acknowledgments to the House, for the handsome manner in which they have treated me on this painful occasion. At the same time, I beg to say, that I receive the acknowledgment of the hon. gentleman with that spirit of frankness in which it has been made; and I feel convinced that he cast an imputation on me, which he has not felt himself justified in doing under the circumstances which have since come to his knowledge. In saying this, I am bound to state that I consider this acknowledgment will be most satisfactory to every member of my family, and I have a particular motive in making that declaration."—The motion was then agreed to amidst cheers from both sides of the House.—Mr. CHRISTIE withdrew his accusation against the Duke of Richmond, in relation to his conduct as chairman of the Lords' Committee on Gaming.—Lord A. LENNOX remarked, that it was exceedingly wrong for any member of the House to prefer a charge which he could not sustain, and which was unbecoming his position as a gentleman.—Mr. CHRISTIE asked (after a short interval had elapsed, which was occupied with other business) if Lord A. Lennox meant to impute to him anything personally dishonourable?—Lord A. LENNOX was not aware that he had said anything unparliamentary. He was under the impression that his noble relative had been maligned, and in giving expression to it, he might have said something which Mr. Christie did not like.—Mr. CHRISTIE persevered in asking for an explanation.—The SPEAKER said he would have interfered if anything personal had been spoken.—Mr. T. DUNCOMBE thought a more explicit explanation desirable.—Lord A. LENNOX at last said he would put an end to dispute, by retracting anything he might have said that seemed personal to Mr. Christie.—Mr. WYSE brought forward his motion for a committee to inquire into the circumstances of the formation of the special jury upon the late Irish trials. He said that there were petitions from nearly 1,000,000 of the Irish people for such an inquiry. He demanded it for them on the allegation that the trial had not been a fair one. He entered into a disquisition upon the public feeling in Ireland with respect to Repeal. He went through a long series of technical details as to the jury-lists, imputing partiality to Mr. Magrath, the officer employed in the business of the jury revision under the Recorder of Dublin. He charged Ministers with having been themselves the founders of Mr. O'Connell's importance, and concluded with some warm remonstrances and admonitions to the Government.—Lord ELIOT opposed the motion.—Mr. M. J. O'CONNELL, Mr. V. STUART, and Mr. S. O BRIEN spoke for, and the SOLICITOR-GENERAL and Mr. GROGAN against it, after which the House divided—For the motion, 73; against it, 91; majority, 18.—Sir R. PEEL obtained leave to bring in a Bill to amend the Church Endowment Act of last session. Under this Act he said 600,000*l*. of Church property had been applied for providing stipends for new livings, the maximum of which is 150*l*. The object of the present Act was to restrain those clergymen, upon the induction into livings whose maximum is 150*l*., from payment of certain fees.

Tuesday.—The House met at 12 o'clock, in order to consider the Metropolitan Buildings Bill in committee.—Mr. HAWES opposed the motion for going into committee by moving the previous question, and was seconded by Mr. MACKINNON, both members contending that the Bill was too important to be hurried forward without due consideration, during the present session.—The Earl of LINCOLN remarked that the junction of Mr. Hawes and Mr. Mackinnon in opposition, was a striking illustration of extremes meeting. Perhaps Mr. Hawes was contemplating a violent attack on Government for its inability to pass its measures, and was doing what he could to make out a case for himself. The Bill was one on which much consideration had been bestowed, and its details had received the approbation of the most eminent architects in London. After a division the House went into committee, and up to four

o'clock had passed 51 clauses. An adjournment then took place till half-past five. On its reassembling Lord PALMERSTON brought the state of the Slave trade under the consideration of the House. **The actual numbers annually carried from Africa** and imported into the Islands and Continent of America for the purposes of slavery were differently estimated. Mr Bandinel calculated them at from 120,000 to 130,000; Sir F Buxton at 150,000 at least. Let **any man imagine this multitude assembled** and marching to their doom, by every variety of misery and torture, and let him be told that this astonishing spectacle was renewed every year, would he not **invoke the vengeance of** Heaven on those who were the authors of these frightful atrocities! For every negro landed two were calculated to perish on the voyage, so that the actual numbers imported must be multiplied by three in order to obtain a correct estimate of the sacrifice of human life. The noble Lord then gave a picture of the whole process of the Slave-trade, the attack on and burning of some peaceful village in the interior, the slaughter, flight, and captivity of its inhabitants; the march to the coast; the horrors of the "middle passage," the living cargo packed into the smallest possible space, each negro fettered, and allowed less room than a man in his coffin; the terrible struggles when, during a storm, the hatchways are fastened down, and the appalling mortality which ensues. Aggregating all the other crimes perpetrated since the creation, their mass could not exceed the enormities engendered by the Slave-trade. On England rested the responsibility of attempting to put an end to such a system. And so far as the late Government was concerned it had done its duty. Treaties with various countries were entered into, in order to effect the extinction of the traffic, one of them, that with France, according the right of search to both countries with Spain, which had at least the effect of greatly mitigating the extent of the traffic into Cuba; and with Portugal, though with that country they were not so successful. But the late Government went further, when it went out of office, it had laid the basis of negotiations with France, Austria, Prussia, and Russia, for a European league against the Slave-trade, into which, when concluded, it was expected that the United States would enter, and thus complete an anti-slavery combination which would effectually prevent the use of any neutral flag, as a cover for the traffic. But since the accession of the present Government, everything had gone backward. France has receded from her engagement to ratify the treaty of 1841, under the pressure of a war cry, aggravated by the efforts of the United States Minister at Paris, General Cass. Following this, came the instructions of the Admiralty respecting the slave barracoons on the coast of Africa, the Aberdeen capitulation with the United States, and the present project of the Government to blockade the African coast, in which, though he gave them full credit for sincerity, he anticipated total failure. The non-ratification of the treaty of 1841 by France would not be counteracted by withdrawing our cruisers from the coast of Brazil, and concentrating them on the extensive coast of Africa, which, with its numerous inlets it would be impossible to guard. Rather let them endeavour to bring about such a cordial understanding with France as would induce her to complete her engagements, and unite the two countries in an effectual combination against the Slave trade. But the present Government had raised the obstacles by which they were prevented from enlightening the ignorant masses of the manufacturing districts, satisfying the millions of Catholics in Ireland, or establishing such a commercial system as would keep us from dropping in the wake of other nations, and provide for our increasing population. But there was one avenue to fame still open to them—they could abolish the Slave-trade, and in so doing they would secure the support of all classes in this country, and the approbation of every friend of the welfare of the human race. He moved for a return showing the total number of African negroes landed for the purposes of slavery on the islands and in the continent of America, from the year 1815 to the year 1841, both inclusive, distinguishing the number so landed in each of those years, and distinguishing also the number landed in each year on the territory of each separate state or power, so far as the same can be made up from documents in possession of Government.—Sir R. PEEL had not expected that so very harmless a motion would have provoked such a display of rhetoric. The political lull had suddenly roused up from the inactivity of the session, and at this late period had attacked the Government through one of those ingenious devices which served him for testing the feeling of the House. At an earlier period he had a motion on the Newspaper, but shrinking from a conflict, had been relieved from his dilemma by the House, on the night when the motion stood for discussion being "counted out." But, ignoring these personal topics, he expressed his cordial approbation of, and concurrence with all that had been so ably uttered by Lord Palmerston in reprobation of the Slave trade. Two countries were mainly responsible for the guilt, and the horrors consequent on the perpetuation of this trade in man. Every other country was ready to join except Spain and the Brazils, and without their cordial co-operation it was impossible to suppress it effectually. There was no ground for the imputation that they were indifferent to the suppression of the Slave trade. The "good understanding" with France was not the misinterpretation of concessions discreditable to this country. The only feeling which would be one which contemplated the welfare of the whole human race. But he gave the French government credit for an honest desire to aid in the suppression of the Slave trade. It stood in honourable contrast with the present of Spain, now governed in a spirit different from that which actuated Espartero, whom he considered an honourable man, sincerely desirous of ruling the country under a sense of duty, and in accordance with our institutions. He, however, disapproved of all interference with the domestic affairs of other countries, and deprecated the idea of Russia dictating either to Christian Espartero, or in particular to the present Spanish Government. He had now answered all the points raised by Lord Palmerston, with the exception of that prosecution which he had no doubt the noble lord alluded very much, and which was doubtless the prompting cause of the speech and the motion. The returns asked for, he had already ordered to be prepared, but the taunts about the loss of the British commerce did not apply to the present Government, which, without disturbing existing interests, had effected more than the late Government, in its expiring moments. But present his duty was to be represented with pain such as he now felt that the Roman Catholic, seeing the agitation between opinions and with even the best motives, he had witnessed during a previous administration. They were told by the noble lord that their only avenue to fame was the suppression of the Slave trade; if so, the House might rest assured that they would have the sincere support of him and his honourable friends. Sir C. Napier, Mr. Bernal, Mr. Borthwick, and Captain Pechell, added a few observations each; and Lord PALMERSTON having replied, the motion was agreed to, with an addition suggested by Sir R. Peel, respecting the numbers of slaves imported in 1837 and 1838, between which years, it was thought, a large increase had taken place. Mr. Hawes moved for a return of copies or extracts from the past and present charts of the harbours, ports, and creeks of the United Kingdom, with the view of improving upon the best means of protecting and improving them.—Sir R. PEEL said he should offer no opposition to the motion, and pledged himself that, so far as the Government were concerned, a full and fair inquiry should be made.—Mr. Hawes said another great improvement, that of Tyne and Shields bar, would necessitate a large expenditure, and he should therefore suggest that the Government should have been consulted," and he should therefore support the motion, which was agreed to.—On the motion of Mr. Hawes a return in detail of the sums of money received and expended by the Ecclesiastical Commissioners for England was agreed to.—Mr. ESPINASSE moved, as an addition, a return of the actual members of all the Bishops in England.—The House divided on this motion—For the addition, 27—Against it, 55—Majority, 28.

Wednesday.—The House met at 12, and proceeded with the committee on the Poor Law Amendment Bill. On the 34th clause, Sir J. GRAHAM proposed that each district should appoint a chaplain at a salary to be fixed by the Poor Law Commissioners.—On this some conversation followed respecting the best mode of working the power, which was finally given to the Commissioners, and this and several following clauses were amicably passed.—Mr. S. O'BRIEN proposed, but did not persist in, a clause for authorising the admission into the district schools of children not paupers, upon some moderate payment.—The committee proceeded as far as clause 64, and the chairman then reported progress.—A large amount of time had been spent in discussing the various clauses, discussion being very keen and desperate on the one side, willing up of the report on the Farm Buildings Bill, a Bill to supply a defect in the law relative to arson in outbuildings. Mr Hume reproached the Government with inactivity with respect to the fires in Suffolk and the adjoining counties; and asked if they had taken any steps to ascertain their causes?—Sir J. Graham replied that the trials at the present assizes would furnish the public with authentic information respecting the origin of these fires.—The Metropolitan Buildings Bill, of which upwards of fifty clauses had been previously passed, was carried into committee, and its remaining clauses assented to with a few verbal amendments, beyond an unimportant question and reply. The Bill contains 118 clauses, with schedules.—Mr. Hawes, who had been absent during the committee, complained of the rapidity with which the Bill had been passed, as he had various amendments to propose.—After some angry conversation, Sir J. Graham entreated Mr. Hawes and Alderman Humphery, when but the opposition to the Bill, not to obstruct it further in the present state of public business.—The Bill finally passed through committee, the report to be received on Friday.

Thursday.—The committee on the Poor Law Amendment Bill proceeded with their labours, and, after a sitting of four hours, got as far as the 66th clause. The chairman then reported progress.—When the House resumed, and before the other orders of the day were proceeded with, Mr. T. Duncombe complained of the course which had been adopted with respect to himself by the secret committee on the Post-office. He was pledged to prove that the letters of foreign Ministers had been opened; that for the last two years an unscrupulous use of the power vested in the Home Secretary had been made; that two years ago a roving commission had been sent into the manufacturing districts in order to open letters; that his own letters had been opened; of Mr. Mazzini's fifty or sixty since Christmas last as well as many of those of Mr. Stallmann, and the other facts connected with the inner or secret department of the Post-office. In support of these charges he had a list of witnesses, but before handing it in, he intimated that it was necessary he should himself be present at their examination. This was refused, the committee declining to apply for permission to the House for that purpose. As he felt that he was himself best qualified to do justice to his own case, he complained of this refusal. It was not a report full of historical or antiquarian research, skimming over the surface of the real question at issue, which the public looked for; any dealing with it searchingly, and he moved that it be an instruction that he should be present at the examination of the witnesses, pledging himself to the same secrecy as each member of the Committee.—Lord SANDON said that the committee were unanimous in opinion, that the presence of Mr. T. Duncombe would embarrass examining witnesses and thereby discovering where and how to make out his case, according to his own avowal, would be injurious to the inquiry.—Mr. HUME believed that Mr. Duncombe had no desire to possess a vote in the committee, nor to influence its decision, but merely to be present when his own witnesses were under examination. He knew no instance of any opposition from which the Member moving for it was excluded.—Sir R. Peel said he had been unwilling to prevent Mr. Duncombe's statement, though it was not very regular to make a motion of which no notice had been given, and to bring on that motion upon an order day in priority to the orders. He should now advise the House to leave the matter in the hands of the secret committee, in whom he thought the utmost confidence might be placed. It would have been just as reasonable to propose, on the other hand, that he himself, or Sir James Graham, should be present; and then what a spectacle would all this have been from the principle on which the House had appointed a secret committee!—Mr. Hume, a Member of the committee, affirmed that there could not have been a more fair and searching investigation than the committee had instituted.—Mr. LABOUCHERE had voted with Ministers on the appointment of this committee, but he regretted his vote when he saw the endeavours of those Members in the other House who opposed the appointment of a committee composed on principles entirely different from those propounded here. This motion had its origin as if the principle asserted in the House of Commons had been laid down for the mere purpose of exculpating Mr. Duncombe.—Sir R. Peel said that what the House of Lords might think it right to do was not a subject for the consideration of the House of Commons.—Mr. T. Duncombe said, that the question was not what was done by the Lords, but what had been said before they had come to the Ministers. He was for asking Mr. Duncombe to the present committee, and concluded with a motion, proposing he be sent for accordingly, and in the way of compensation, he said Mr. M. Sutton, the Under Secretary of State, also.—The O'Connell Jun., a member of the committee, defended the course taken by them. It was due to the members of the present and of the late Government to say, that the fullest information had been produced on all sides.—The SPEAKER observed, that Mr. Duncombe's nomination had been already suggested as a foreign proceeding; and that the appointment of the committee was a prerogative of the Crown of the House.—Mr. WILLIAMS argued that the committee would be overburdened by the inquiries.—Mr. Bernal, a member of the committee, declined to examine.—Mr. T. Duncombe's amendment was then withdrawn; and Mr. Duncombe replied, in reference to Lord Sandon's statement. There had been an inquiry in the Post-office, amounting almost to a prosecution, in order to find out what persons had given information upon this subject. He begged now to ask whether his own letters had been opened? He would say, considering the want of compulsive power to compel witnesses, that no committee of any government belonging to that House was a proper tribunal upon the subject.—Sir J. Graham said that the hon. member well knew it was impossible for him, consistently with the duties of both, to answer the question. He had been, and was again to be, responsible for the conduct, and to defend the arbitrary power, and should not quote without the smallest hesitation. [illegible] Mr. Hawes, in reference to the motion for inquiry, Mr. Macaulay complained that the examination of such a witness should be placed in the hands of the Government, whose very existence depended on the result. The motion, after some [illegible] was withdrawn, and the Bill was read a third time and passed.—The House went upon the committee on the Poor-law Amendment Bill, the remaining clauses of which were agreed to, with but little discussion. The new clauses which it was proposed to add, however, provoked some debate, and Ministers were defeated in a division upon one moved by Mr. Buncombe, empowering guardians to grant relief to widows in the union to which they may become chargeable, without regard to their place of settlement.

Friday.—Mr. GLADSTONE moved certain resolutions relating to the deposit of railway sections, plans and bills, in the Railway Department of the Board of Trade, and to reports which may be made thereon. He said it was unnecessary to enter into any detailed statement, as the resolutions fully explained the object the Government had in view. The resolutions provided for the deposit of copies of all plans, sections, &c., at the office of the Board of Trade, and for other objects which it is not necessary to specify in detail.—After some observations by Mr. PLUMPTRE, condemning the desecration of the Sabbath by railways, the Bill and resolutions were ordered to be engrossed.—The Metropolitan Buildings Bill was read a third time, Mr. HAWES at the same time giving notice that Lord Lyndhurst and himself had entered into a treaty of peace and amity on the subject. The House then went into committee on the Joint Stock Companies Bill.—Mr. GLADSTONE said in answer to Mr. D'Israeli, that it was thought desirable he would introduce a clause on bringing up the report, to extend the provisions of the Bill to Ireland. A long desultory conversation took place on every clause, but they were all agreed to, and the report was ordered to be received on Tuesday.—Mr. HAWES asked a question respecting the case of two women sentenced to death at the late Kingston assizes for murder. He did not think the evidence satisfactory to establish their guilt.—Lord ELIOT explained that the hon. member had not given him notice of asking this question, and therefore he could not give any satisfactory answer. He would, however, immediately communicate with the Lords Justices on the subject, and give the hon. member all the information he obtained.—On Sir G. CLERK moving the order of the day for going into a Committee of Supply, Mr. BULLER rose, pursuant to notice, and called the attention of the House to the statement of a statement being made by the Government respecting the disposal and the results of the money of public moneys voted for the purposes of education. He understood that some further information on the subject of education ought to be laid before Parliament. He was aware that the Government could not sanction the education of the peasantry, but they might do much towards encouraging it by promoting the formation of public libraries. In this country there was scarcely a library which could be called a public one except the British Museum, which he considered a disgrace to the Nation. In Paris there were four public libraries open to all persons. Russia expended [illegible] on the purchase of books and manuscripts, and another country the subject was one which ought to engage the attention of Parliament.—Lord MORPETH said he fully concurred in most of what had fallen from the hon. Member who had just addressed the House. There was a want of public libraries in this country, which was a subject worthy of consideration. He thought, however, without any legislative enactment on the subject of education, much might be done for promoting it.—Mr. BULLER withdrew his motion.—Mr. T. Duncombe said that as the opinion of the Judges had not yet been delivered respecting the trial of Mr. O'Connell, he would postpone until another supply day the question for an address to her Majesty praying her Majesty to release the prisoners.—[Left Sitting.]

(IT).

Metropolis and its Vicinity.

Royal Commission of Fine Arts.—The final meeting of the Commissioners, for the present session, took place on Friday last, at Lord Lansdowne's, when the opinion of the House on the merits of the respective plans contributing to the embellishment of Green Park, now on view in Westminster Hall, was formally pronounced by the secretary of the Commissioners, whose decision has been determined on the recommendation to execute works on a grand scale, for the decoration of the New Houses of Parliament. The gentlemen selected are Mr. Cope, Mr. Herbert, Mr. Dyce, Mr. Maclise, Mr. Redgrave, and Mr. Thomas. It

appears that six arched compartments in the House of Lords, each measuring 9 feet 3 in. wide, by 16 feet high to the point of the arch, are to be decorated with fresco paintings, illustrative of the functions of the House of Lords and of the relation in which it stands to the Sovereign; that the subjects of three of the paintings are to be personifications or abstract representations of religion, justice, and the spirit of chivalry; and that the three remaining subjects corresponding with such representations, and expressing the relation of the Sovereign to the Church, to the law, and, as the fountain of honour, to the State, are to be—the Baptism of Ethelbert; Prince Henry, afterwards Henry V., acknowledging the authority of Chief Justice Gascoigne; and Edward the Black Prince receiving the Order of the Garter from Edward III. Each of the six artists is to be remunerated with the sum of 400*l.*; but the Commissioners do not bind themselves to employ them finally on the fresco paintings in the House of Lords. The six subjects are distributed among the six artists as follows:—The subject of Religion is given to Mr. Horsley; Justice to Mr. Thomas; Chivalry to Mr. Maclise; the Baptism of Ethelbert to Mr. Dyce; Prince Henry acknowledging the authority of the Chief Justice to Mr. Redgrave; Edward the Black Prince receiving the Garter to Mr. Cope. A general competition is also invited, and, as an encouragement to artists who have not been selected, the Commissioners offer three premiums of 200*l.* each, for the best subjects produced. Thus another exhibition, doubtless far exceeding in interest either of those already opened, will take place in the summer of next year. In addition to the selection of the above artists to execute designs for frescoes, the Commissioners have chosen three sculptors from among the number contributing to the exhibition in Westminster-hall, whom they recommend for employment on such works as may hereafter be required for the purposes of decoration in the New Palace. The artists selected are Mr. W. C. Marshall, Mr. John Bell, and Mr. J. H. Foley. In reference to the various works of these painters and sculptors, we may here observe that Mr. Cope, the first-named painter, received a first-class prize for his cartoon of "The First Trial by Jury," in the exhibition of 1843. He has only one subject in the present exhibition, a fresco, and entitled "The Meeting of Jacob and Rachael." Mr. Horsley received a second-class prize of 200*l.* in 1843, for his cartoon of "St. Augustine Preaching to Ethelbert and Bertha, his Christian Queen." He has two frescoes in the present exhibition, the one entitled "Prayer," the border to which was designed and painted by Mr. Owen Jones, and the other entitled "Peace." Mr. Dyce's name did not appear in the catalogue of the Cartoon Exhibition last year, but he has a subject among the frescoes now exhibiting, entitled "Two Heads from a Composition representing the Consecration of Archbishop Parker in Lambeth Chapel, A.D. 1559." Mr. Maclise, the well-known academician, contributes to the present exhibition a fresco, described in the catalogue as "The Knight." Mr. Redgrave, another name which does not appear in the catalogue of 1843, is the artist of a fresco now exhibiting, and entitled "Loyalty"—Catherine Douglas barring the door with her arm to withstand the assassins of James I. of Scotland. Mr. Thomas was a successful competitor in 1843, having received an additional premium of 100*l.* for his cartoon of "St. Augustine preaching to the Britons." He contributes to the present exhibition three subjects, a cartoon, a fresco, and an oil-painting, respectively marked —"The Throne of Intellect," "Philosophy," "The Throne of Intellect." Of the sculptors selected, Mr. Marshall has two works in the present exhibition, the one a full length of "Geoffry Chaucer," the father of English poetry, and the other a figure of "Eve." Mr. Bell contributes two models of sculpture, one called "The Archer, or Eagle-slayer," and the other a figure of "Jane Shore." Mr. Bell also exhibits a cartoon, entitled "The Angel of the Pillar." Mr. Foley has also two subjects, the first being the figure of "A Youth at a Stream," and the second, a group of "Ino and the Infant Bacchus." On Monday the exhibition of the works of art placed in Westminster-hall was for the first time thrown open for the gratuitous admission of the public. Though it was not generally understood that the exhibition would be free so soon after its first opening, the hall was numerously attended, the great majority being well attired. All conducted themselves throughout the day with perfect propriety and decorum, and quietly paced up and down the avenues on either side of the hall, viewing with attention the cartoons, frescoes, and sculptures.

Diocese of London.—The Bishop of London has addressed a letter to the rural deans of his diocese, in which he directs attention to the advantages which might be expected to result from periodical meetings of incumbents of parishes within the respective deaneries for the purposes of conference. His Lordship states that many of the clergy have expressed to him a strong opinion as to the desirableness of more frequent personal communication between those who are connected with each other by being intrusted with the care of souls in the different parishes of the same diocese, and have regretted that they seldom meet together in their ministerial capacity, except at the visitation of the Bishop or the Archdeacon. The Bishop expresses his opinion that this desired bond of union, and readier means of communication, would be secured by periodical meetings of the incumbents of all the parishes in a rural deanery, or, where the number is small, in two adjacent deaneries, under the presidency of the Rural Dean, by whom their proceedings should be made known at intervals to the Archdeacon, to be reported by him, if necessary, to the Bishop. By the same channel the clergy might be made acquainted, on particular emergencies, with the wishes of their diocesan. The Bishop also suggests that the subjects of conference at such meetings should be strictly of a practical kind, in no case touching upon theological controversy, but relating to the management of parishes, the methods of performing the ministrations of the clergy in public and in private—the advancement of local, diocesan, and general charities connected with the Church—the various modes of bettering the condition of the poor, the formation and conduct of schools, and such occasional questions affecting the interests or usefulness of the Church as may be submitted by authority to their consideration. Here there might be, the Bishop says, ample matter for profitable and friendly conference, without the introduction of those doctrinal questions which would be apt to give to such meetings a polemic instead of a pacific character, and to make them, before long, centres of mutual repulsion rather than of attraction. The following rules for the regulation of the Ruridecanal Chapters in the diocese have been submitted:—1. The Rural Dean, with consent of the Archdeacon, and under the authority of the Bishop, shall call a meeting of the incumbents within his deanery once in every quarter. 2. The Archdeacon shall preside at such meetings, if present, otherwise the Rural Dean: or, in his absence, some incumbent in the deanery appointed by him. 3. At every quarterly meeting the Rural Dean shall request information from the clergy as to the method in which the various offices of the Church are performed, the state of their various parishes with respect to their churches, church services, and schools; the means employed in their parishes to promote the interest of the Church Societies, diocesan or national, and the funds collected for local or general purposes of charity; also conferring with them upon such other points as he may be instructed or shall think fit to submit to them. 4. A register shall be kept by every Rural Dean, in which shall be recorded the proceedings of every meeting, and a brief report thereof shall be made to the Bishop by the Archdeacon. 5. One of the incumbents of the deanery shall be appointed by the Rural Dean to act as secretary, if necessary. 6. Every meeting of the Rural Chapters shall be preceded by attendance at morning prayer in the parish church.

Court of Common Council.—At a meeting of the Court on Thursday, a portrait of Lord Denman, who was Common Sergeant of the City previous to his promotion as a Judge, was presented to the Corporation by Mrs. C. Pearson, wife of the City Solicitor. The portrait was painted by Mrs. Pearson, who received the unanimous thanks of the Corporation for her present.—In the course of the meeting, it was stated that the new Royal Exchange will be opened during the present Mayoralty.

Review in Hyde Park.—The 1st Life Guards, stationed at Regent's-park barracks, the 2d Life Guards, at Hyde-park barracks, the 2d battalion of the Grenadier Guards, at St. George's barracks, the 3d battalion of the Grenadier Guards, at St. John's Wood barracks, the 1st battalion of the Coldstream Guards, at Portman-street barracks, and the 2d battalion of the Coldstream Guards, at Wellington barracks, were reviewed by the Duke of Wellington on Saturday morning in Hyde-park, the ground being kept by the 17th Lancers from Hounslow.

Piccadilly Improvements.—On Saturday, the Government Bill to "widen and improve Piccadilly," was printed. It is proposed that the Commissioners of Woods and Forests be empowered to widen Piccadilly between Bolton-street and Park-lane, of the uniform width of 70 feet. The portion of the Green Park required is to be taken from St. Martin's parish, and annexed to that of St. George's, Hanover-square; and after the improvements of the Commissioners, the repairs are to be done by the latter parish. The Commissioners are empowered to obtain possession of the scheduled property; but the only property thus put down is the "tenement and garden" of Baron Rothschild, held on lease from the Crown.

New Exeter Change.—Exeter Change, the once famous mart for all articles of cutlery and the toilet, is about to be renovated near the spot of its former existence. The Marquis of Exeter has connected Catherine-street, Strand, and Wellington-street North, by an arcade consisting of ten shops, with convenient dwellings attached, designed by Mr. Sidney Smirke, the architect, and tastefully decorated with arabesque ornaments, by Mr. Collmann. The roof consists entirely of glass, and when the shops are occupied and fitted up, the New Exeter Change will form the most elegantly-finished mart of the kind in London. The continuation of Wellington-street to Holborn, which is in progress of completion, will, no doubt, make this arcade a favourite thoroughfare.

Model of Venice.—Last week an interesting model of the city of Venice, recently exhibited in Pall-mall, was brought to the hammer, at Messrs. Rushworth and Jarvis's, Saville-row. Twenty guineas was the first offer. An advance of five guineas was then made; and, after four other biddings of one guinea each, the Model was knocked down to Mr. Tyler, proprietor of the Royal Surrey Zoological Gardens, for 31 guineas. It was the result of years of labour, and cost many hundred pounds.

The Loss of the Manchester.—The following extracts of letters from Cuxhaven and Altona furnish additional particulars respecting the fate of this ill-fated steam-packet:—"Cuxhaven, July 11.—The bodies of two of the passengers have been found, and brought in here in a decomposed state. The bodies have been recognised to be those of Mr. P. Rothery and Miss Emily Smith." "Altona, July 10.—From Busum we learn that six bodies have been found, amongst which are Capt. Dudley' who was interred in Wesselburen churchyard, Mr. G. Smith, Mrs. Smith, and those of two seamen, one of which was picked up with a thick rope round his body." The bodies of the Stewardess and two others, making altogether eleven, have also been found.

Marylebone and Paddington Hospital.—A public meeting was held on Thursday at the Marylebone Literary and Scientific Association, for the purpose, amongst other things, of completing the funds considered necessary to be secured before entering upon the building of this hospital. The Earl of Manvers took the chair, supported by the Earl of Beverley, Sir T. Philips, Mr. B. B. Cabbell, and several friends and patrons of the hospital. The Secretary read the report, which exhibited the prospects of the institution in an encouraging state. In money and other property, the committee had already in their hands upwards of 13,000*l.*, and the sum of 1224*l.* only was required to make up the necessary sum of 15,000*l.* As soon as the last-mentioned sum was obtained, and also the proposed site for the institution, the necessary buildings for the hospital would be commenced. The site proposed was in the vicinity of the buildings of the West Middlesex Water-works, and was the gift of the Bishop of London, T. Thistlethwaite, Esq., and the other trustees of the Paddington estate, and comprised upwards of three quarters of an acre of ground. The Earl of Beverley moved that the report be adopted, the motion was seconded by Mr. Bontifre, and carried. Mr. Rose, a county magistrate, in moving the second resolution, pressed upon the meeting the necessity which existed for the establishment of the hospital. More medical aid was wanting in the north-western districts of London than was received from the Northern Dispensary. The resolution was to the effect "that the buildings be commenced as soon as practicable, after the sum constituting the deficiency should be subscribed, and the possession of the site obtained." The Rev. Mr. Boone seconded the motion, and it was unanimously adopted. Some other routine resolutions having been adopted, thanks were voted to the trustees of the Paddington Estate, and to the chairman.

Houses of Parliament.—The following report, with the evidence on which it is framed, has been issued this week. The select committee appointed to inquire into the present state of the building of the New Houses of Parliament, and to report thereon to the House, have, pursuant to the order of the House, examined the matters to them referred, and have agreed to the following report:—Your committee have examined Mr. Barry, as to the progress already made in the buildings of the new Houses of Parliament, and have endeavoured to ascertain from him the probable time that will elapse before the whole of the works can be completed, and the period at which the two Houses may be occupied for the transaction of public business. He has stated to them, that were it urgently required, the Houses, and a certain number of committee-rooms, and other offices, might be prepared for occupation at the commencement of the year 1846; but your committee do not feel themselves justified in affirming that such occupation could take place without inconvenience to the Members, or impediment to the further progress and satisfactory completion of the building; and they think it right to observe, that the general arrangements for ventilation cannot be completed till the commencement of the year 1847. Your committee have examined the Speaker, the Clerk of the House, and the Sergeant-at-Arms, as to various alterations which have been lately proposed in the interior arrangements of the House of Commons and of some portions of the building immediately adjoining, and have to report that Mr. Barry will be able to adopt several valuable suggestions which the experience of the officers of the House has enabled them to offer, without any increase of the expenditure already authorised. Your committee have examined various parties as to the course hitherto adopted by Mr. Barry, with reference to alterations of the interior arrangements shown in the plan approved by committees of both Houses in 1836. They impute no blame to Mr. Barry for that course, and have every reason to believe that all the alterations hitherto made have conduced to the convenience and general effect of the building; but, looking to the misapprehension that appears to have prevailed as to these proceedings hitherto, they are prepared to recommend that, in future, Mr. Barry should make a half-yearly report of the progress of the works to the Commissioners of Woods and Forests; and should also submit to that board any alterations which may hereafter be deemed advisable, and accompany such report with plans of the alterations proposed. Your committee further recommend that, as several alterations, entailing more or less expense, have recently been sanctioned by the Government, the Chief Commissioner of Woods shall, at the commencement of the next session of Parliament, lay upon the table of the House of Commons a statement of the total estimated cost of the building, according to the latest plan approved. Your committee also suggest that a plan, prepared by Mr. Barry under their direction, and exhibiting the present state of the building, and the alterations adopted up to the present time, shall be signed by the Chief Commissioner of Woods, and deposited in the libraries of both Houses.—*July* 4, 1844.

The Convict Dalmas.—On Monday last, Mr. Keene, the governor of Horsemonger-lane gaol, received an order from Sir J. Graham, the Home Secretary, directing that the convict Dalmas should be immediately removed to the Millbank prison. It was stated that this step was preparatory to his being transported for life, and that information had been conveyed to the convict that h r

Majesty had been pleased to spare his life on the above conditions. Mr. Keene was also said to have informed Dalmas of the determination of the Government relative to his fate, and it was added that the convict was extremely cheerful, and expressed himself satisfied. It is, however, stated by the Ministerial papers that nothing certain is known with respect to the ultimate fate of the convict. It is true that, by order of the Home Secretary, Dalmas was removed to the Millbank Penitentiary, and instructions were forwarded to the governor to keep the convict for one month, and allow medical men to attend him during that period. On the result of a month's inquiry and examination will depend whether Dalmas is sent to Bethlem, as an insane prisoner, or transported to one of the penal settlements for life. No order has yet been issued for his transportation.

The Convict Barber.—Sir J. Graham has intimated that he can see no ground whatever for interfering with the conviction of Barber; and the ship Agincourt, in which the convict and his accomplice, Fletcher, are passengers, is on her way to her destination. It is said that, if any confirmation of the propriety of the verdict had been considered necessary, that confirmation was furnished in the ingenious struggle to appear an innocent man made by Barber after his condemnation, which showed how impossible it was that so clever a person could have been made the dupe of one so far his inferior.

The Boy Jones.—A letter from an Officer of H.M.S. Warspite, in a Leeds Paper, dated off Gibraltar, 16th June, mentions that while cruising between Tunis and Algiers, the boy Jones, who obtained notoriety some time back by secreting himself in the private apartments of the Queen at Buckingham Palace, and was afterwards sent to sea in that ship, fell overboard in the night during the first watch. The life-buoy was lowered with the cutters, and on the latter pulling towards the life-buoy, the port-fire of which was blazing away with a steady light, they found no less a person than Master Jones, who was holding on with one hand, and dashing the sparks of the port-fire from his face with the other. As they approached he sung out—"Here I am, look lively." They quickly succeeded in getting him into one of the boats, the other taking the buoy in tow. When brought on board he was questioned by the Lieutenant of the Watch, and stated that he had fallen out of the mizen rigging accidentally; but the ship's crew were of opinion that if it had been a rough night Jones would not have gone overboard at all; they all thought that he jumped overboard, and that for no other purpose than to see the life-buoy light burning, and this is in some measure confirmed by the fact of his crying out when falling, "A man overboard," and again when immersed, "Let go the life-buoy." "However," adds the writer, "he is a singular character, and the thing is not at all unlikely."

St. Katherine's Docks.—At the half-yearly meeting of the St. Katherine Dock Company, held on Tuesday, a dividend of 2½ per cent. was declared. The statement of ships entered inwards for the last six months showed, compared with the same period of last year, an increase of 60 ships, and 6930 tons—the respective numbers being 375 ships and 75,997 tons, and 435 ships and 82,927 tons. The goods landed during the same period showed an increase of 424 tons, the deliveries an increase of 1569 tons, and the goods warehoused an increase of 354 tons.

Railway Bridge across the Thames.—According to the *Times*, another bridge across the metropolitan portion of the Thames is proposed. It states that among the speculations of the day is a plan of a metropolitan junction railway, one of the most conspicuous schemes of which is the formation of a railway bridge across the River Thames at Battersea.

Fire in the Docks.—Considerable alarm was excited on Saturday morning in the neighbourhood of the West India Docks, by the outbreak of a fire in the forecastle of the barque Hand, 150 tons burden, laden with a cargo of guano. When first discovered it was raging with fearful violence, and before the arrival of assistance, the destruction of the ship, and ignition of other craft, appeared inevitable. Fortunately the fire was prevented from communicating with the rigging, but a quantity of cordage in the hold having ignited, and the guano being on fire, the stench was almost stifling, and the duty of the firemen was thereby rendered one of no ordinary difficulty. By three o'clock the mastery of the flames was complete, but the forecastle was burned out, and all the contents completely destroyed. It is fortunate that at the time of the outbreak no one was sleeping in the forecastle, as, from the peculiarly suffocating nature of the cargo during the process of combustion, the disaster might have been attended with loss of life. It is supposed that the guano spontaneously ignited, and the current of air rushing down the forecastle, fanned the smouldering materials into a blaze.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending July 13th:—West Districts, 113; Northern, 170; Central, 145; Eastern, 169; Southern 234; Total, 831. Weekly average for the last five years, 946.

Provincial News.

Ambleside.—The company at the Lakes during the last few weeks has been very numerous. The inns at Bowness, Ambleside, Low Wood, and the Ferry, have been crowded, as well as the different lodging-houses, and among the company are many distinguished visitors. Amongst the anglers to be seen on Windermere, is a lady who is busily engaged from morning till night trolling for pike, spinning minnow for char, or bobbing for perch. She one day hooked no less than 26 fine pike.

Bolton.—Considerable excitement prevails in this town in consequence of a threatened turn-out of the operative cotton-spinners in the district. Three weeks ago the spinners of Bolton gave notice to their employers that they would leave work at the end of a month unless their wages were advanced ten per cent. The term of notice expired on Saturday, and as no satisfactory arrangement had been come to, most of the operatives left work at the time fixed. The consequence is that many of the mills are now stopped for want of hands, whilst some of the masters have readily complied with the demand of their workpeople, and agreed to give the advance required. Most of these masters have made a condition that, unless the advance be made general, they will come down to the price paid by their neighbours. There are other masters, however, who declare their determination not to give any advance whatever, and in this state things remain at present. The operatives have called an extraordinary meeting of delegates from all the mills in Lancashire, to be held in Manchester, where it is said some definitive course will be adopted, not only as regards Bolton, but other towns in the manufacturing districts.

Brighton.—An experiment illustrative of the powers of Captain Warner's invisible shells was to have been exhibited off Brighton on Saturday morning. An eminent shipowner of London had presented Captain Warner with a stout barque of 300 tons, for the purpose of proving that no ship could chase a vessel furnished with Captain Warner's implements of warfare without herself being certainly destroyed. The experiment was to have been exhibited between noon and 2 p.m., but unfortunately the ship, which left the Downs on Wednesday on her passage for Brighton, was caught by the S.W. wind which suddenly sprung up, and was obliged to put back to the Downs. A large party of noblemen and gentlemen went down to Brighton specially to witness the spectacle, and were much disappointed at its unavoidable postponement. Lords Brougham, Southampton, Ingestre, Worsley, John Beresford, Longford; Captains Dickinson, Henderson, Tracy, R.N., and Messrs. Hutt and Masterman, M.P., &c., were among the visitors. It was, however, announced that the experiment will be performed, either in the Downs or off Brighton, in the course of the week, according as weather permits.

Bury St. Edmunds.—Lord Wodehouse has addressed the following letter to the Editor of the *Times*, in reference to the attack he made on that paper in the House of Lords on Monday week:—"Sir—The remarks which I made in the House of Lords on Monday in reference to your Norfolk and Suffolk correspondent were made under a misapprehension of the nature of his statements respecting the gentleman alluded to. I much regret this misconception, and the strong and hasty expressions into which it led me; and I feel bound to apologise to your correspondent, and to withdraw my observations respecting him. I am, Sir, your obedient servant, WODEHOUSE. Albyns, near Romford, July 11."

Dover.—A melancholy accident happened in Dover Bay on Monday, by the upsetting of a small punt, 12 ft. long, and of a class not adapted to carry sail. She had been hired by Mrs. Bennett, the wife of Mr. Bennett, a woollen manufacturer of Frome, who arrived with his family about a week since for the benefit of their health. On Monday, Mrs. Bennett, with her two daughters and her nephew, Mr. H. Rawlings, went out in the boat for a sail, accompanied by two seamen, who were not, however, licensed boatmen. It appears that the boat was under sail and tacking, about a mile off the land, when she was observed to upset, a brisk breeze blowing at the time. On observing the accident, several boats were immediately launched from the beach; but before they could get out, a fishing-smack that was about half-a-mile to windward bore down, and sent her boat to the spot. The fishermen picked up Mrs. Bennett and the two men; but the gentleman and the two young ladies had disappeared. The boatmen saved themselves by swimming, and it is supposed that Mrs. Bennett's clothes kept her above water. Mrs. Bennett was brought on shore almost lifeless, but was placed in a warm bath; and by the application of the means recommended by the Humane Society was fortunately recovered. Mr. Bennett had gone to Folkstone, and did not hear of the accident until his return. The bodies of the youngest daughter and of Mr. Rawlings have been found.

Liverpool.—Sir W. Stanley, of Hooton-hall, having recently erected a new hotel at Eastham Ferry, on the Cheshire side of the Mersey, a regatta was got up to give *éclat* to the new establishment. This regatta (consisting of sailing-matches, boat-races, and the usual varieties of such diversions) came off on Tuesday. The sports were scarcely at their height, when an accident occurred which threw a damp on all the subsequent proceedings. Three light boats started to compete for one of the prizes, and two of them having pulled round the flag-vessel, the other followed at some distance; but the water was too rough to render it safe for so fragile a craft to be thrown into the trough of a sea, and the danger was rendered more imminent by the fact that a youth about 14 years of age, the son of Mr. Brown, late Mayor of Chester, was steersman. The result was disastrous in the extreme; the boat swamped, and all on board, five in number, were in the next instant struggling in the water. The Eastham Ferry steamer promptly stood towards them, and picked up four persons in an exhausted state; but Master Brown, the helmsman, sank before he could be reached, and the body has not yet been recovered.

Salford.—An extensive fire broke out on Sunday morning, on the premises of Messrs. Wilson and Co., machine makers, engineers, &c., in Garden-lane, which, in the course of an hour, were completely gutted; and the fire also communicated with the extensive sizing works of Messrs. Lavino and Co., with which there was a communication by a wooden stage across the street, and which were speedily levelled with the ground. The loss of property is stated to exceed 10,000*l.*, the principal part of which is covered by insurances. Several cottages of poor people in the neighbourhood were also injured.

Windsor.—On Friday afternoon a fire broke out in the new houses nearly completed in Upton Park. The military immediately turned out with their engine, and were preceded by several others; but by the time the first engine arrived the fire had taken such hold that the flames could not be subdued until the buildings, three in number, were completely gutted. The houses were in a state of completion, on the left of the road leading from Slough, in a picturesque spot, commanding a fine view of the Castle. It appears that the workmen were engaged in dressing the flooring boards of the houses, and it is conjectured that the fire in one of the rooms communicated with the shavings, where nearly 2000*l.* worth of materials were being seasoned for finishing the buildings, the whole of which, with the carpenters' tools, were consumed. The property is insured.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2836*l.*; Eastern Counties, 4775*l.*; Edinburgh and Glasgow, 2296*l.*; Great Western, 16,993*l.*; Grand Junction, 8728*l.*; Glasgow, Paisley, and Ayr, 1532*l.*; Great North of England, 1742*l.*; London and Birmingham, 18,285*l.*; South Western, 7675*l.*; Blackwall, 1336*l.*; Greenwich, 808*l.*; Brighton, 4157*l.*; Croydon, 500*l.*; Liverpool and Manchester, 5294*l.*; Manchester, Leeds, and Hull, associated, 7493*l.*; Manchester and Birmingham, 3339*l.*; Midland, 9877*l.*; Newcastle and Carlisle, 1888*l.*; Newcastle and Darlington, 688*l.*; South-Eastern and Dover, 5012*l.*; Sheffield and Manchester, 603*l.*; York and North Midland, with Leeds and Selby, 2478*l.* At the special meeting of the Grand Junction Company last week, resolutions were passed for raising the necessary funds in shares of 12*l.* 10*s.* each, agreed to be subscribed towards the Lancaster and Carlisle line. At this meeting the chairman of the Grand Junction Company announced the satisfactory conclusion of the points in dispute between the Grand Junction and Birmingham boards, observing that the general relations of the two companies would, by the arrangements in progress, be placed permanently on a greatly improved footing; whilst the result so far as the public were concerned was, that the two bodies, by working together cordially, would enable them to give increased accommodation, and on reduced terms, such as it would be out of the power of any other party to offer. The following is published as the outline of the terms on which these companies have settled their differences, though it appears that no official account of the matter has yet been issued by either party:—1. An alliance, offensive and defensive, against all competing lines.—2. The Holyhead to be left to the London and Birmingham; and, if made, the Grand Junction not to oppose them by any alliance with steamboats or otherwise, and to give every facility in the conduct of the traffic as they would to any other line joining them.—3. The Shrewsbury lines both to be in abeyance for the present, with an understanding that it will be carried out by the Grand Junction, commencing at or near Wolverhampton.—4. The Trent Valley to be carried out something on the same plan as at first proposed, the terms being agreed by the deputation, subject to the assent of the Manchester and Birmingham Trent Valley Company.—5. The Grand Junction to withdraw all connexion with the London and York schemes.—At the Ulster Railway meeting of the 3d inst., the shareholders resolved to complete the original plan of the Company by carrying on the line from Portadown to Armagh. The engineer stated that the expense would be about 10,000*l.* per mile, including the cost of the bridge across the river Baun. Traffic appears to be expected from the adjoining districts, and Armagh being a town of greater population than Portadown, it has been thought more desirable to make the terminus there. An extension as far as Monaghan was spoken of by some parties, but this did not meet with the approbation of the meeting.—A meeting of the inhabitants of Banbury was held on Friday to discuss the merits of four projects of railway, which have been submitted as advantageous to that town, and the one selected by a large majority was the Great Western from Oxford to Rugby. The other three were the Oxford, Worcester, and Wolverhampton line; the London and Birmingham, from Weedon to Worcester; and the Birmingham, Banbury, and Oxford line. Deputations were present in behalf of the respective projects, and a very animated debate was entered into.—The Ministerial papers announce that the result of an interview which took place on Wednesday between Mr. Gladstone, on the part of Government, and Mr. Entwistle, M.P., Mr. Hudson, Mr. Glyn, Mr. Saunders, &c., as a deputation from the railway companies, is in the highest degree satisfactory. The subject having been fully gone into, the President of the Board of Trade stated his determination so to modify the Bill as to render it in every way unexceptionable to the railway interest. The measure will now pass through Parliament without opposition, and will prove, in the language of a member of the deputation, who has hitherto taken a leading part in opposition to the Bill, "a good Bill for the public as well as for the shareholders"

IRELAND.

Dublin.—His Excellency the Lord-Lieutenant and the

Countess De Grey held a levee on Monday at the Castle. The ceremony was very numerously attended, the streets being for some time almost impassable from the number of equipages making their way as best they could through the avenues leading to the Castle. About 1000 persons are stated to have been present on this, the last public opportunity of complimenting the noble Earl and his Countess. Two addresses were presented to their Excellencies, one of which emanated from a Protestant meeting held on Friday last; the second was that of the nobility, gentry, &c. of Ireland, and bearing the signatures of men of all parties. After the reception, addresses were presented by deputations from the Royal Institute of the Architects of Ireland, and from the Society of Irish Artists. Lord and Lady De Grey took their departure on Tuesday, under the usual salute from the Military, &c.—The weekly meeting of the Repeal Association took place on Monday. Mr. James Kelly, the newly-elected Roman Catholic and Repeal member for Limerick, was called to the chair, and addressed the meeting at some length. His speech consisted of an enumeration of the advantages to be derived from a Repeal of the Union, and an elaborate repudiation, on behalf of Roman Catholics, of the desire for ascendancy attributed to them by the opponents of the measure. Mr. Roche, M.P., stated that he had been requested to act for the day as the representative of Mr. Smith O'Brien, who was absent on business of importance in Limerick, and handed in several sums of money forwarded to that gentleman during the past week from various parts of the country. Mr. D. O'Connell read a letter from the Earl of Wicklow, in answer to the recent resolutions of the Association respecting certain Bills now before Parliament. Lord Wicklow asks, why, if the Association consider the proceedings of the Imperial Parliament worthy of their attention, they do not request those members of their own body, who are also members of Parliament, to attend; and why, on the other hand, they call upon individual members to interfere, when, in the opinion of the Association, all interference would be useless? The secretary also read a letter from the O'Conor Don, M.P., on the same subject, in which he stated that he should always consider it his duty to attend to any suggestion he might have the honour of receiving from the Repeal Association, and promising his best attention to the recommendations of the committee. Some small sums were announced as having been received from America. After a speech from Mr. W. J. O'Connell, who handed in 48*l.* from a new ward of Repealers in London, Mr. D. O'Connell, jun., announced that his father and the rest of the prisoners were in the enjoyment of excellent health. He had another piece of news for them. Earl De Grey was to quit their shores, he hoped for ever, to-morrow, carrying with him the contempt of the whole Irish people. He regretted that the battle against Repeal Buttons, which had been commenced by the Lord Lieutenant, had been carried into the national education schools, from which every boy who persisted in wearing a Repeal Button was excluded. He protested against such pettifogging conduct, and denied that a Repeal Button was a party badge, because Repealers were not a party, but the whole Irish people. However, his father did not wish that children should be deprived of the benefit of education in consequence. At the same time he admired their spirit in wearing it; but was it not very easy to put it into their pockets when going into the school-room? He concluded by stating that his father had scarcely any hope that the Writ of Error would be decided in his favour, and he was glad it was so, because it would show them the necessity of depending on themselves. Mr. H. Grattan, M.P., and Mr. Roche, M.P., addressed the meeting at great length on a variety of topics. The rent for the week was 1688*l.* 14*s.* 3*d.*

King's County.—The Crown solicitor for the Home Circuit has served notice that the persons in custody, charged with the murder of Lord Norbury, will be brought to trial at the present assizes for the King's County. The Crown had declined proceeding with this case at the last assizes, and the two individuals accused were detained in custody. Respecting the nature of the evidence for the prosecution some very curious statements are afloat; but under present circumstances the papers do not further allude to the subject.

SCOTLAND.

Edinburgh.—It was stated some time ago, that the Political "Martyr's" Monument was about to be commenced on a piece of ground granted by the Town Council on the Calton-hill, immediately to the east of Burns's monument. It appears, however, that the feuars on the Regent and Royal Terraces, having intimated their determination to insist upon their right of servitude against buildings being erected along the south side of the Regent-road, the Monument Committee have abandoned their intention of placing it on the Calton-hill.

Glasgow.—The Duke of Sutherland has bought the beautiful property of Glenarback, which lies upon the north bank of the Clyde, immediately opposite his son-in-law (Lord Blantyre's) splendid mansion, at the cost, it is said, of 14,000*l.*—It is intended to have a grand festival in honour of the poet Burns. It will be one of unusual brilliancy, and be patronised by large numbers of the Scottish nobility and gentry, who have already signified their intention of being present. Lord Eglinton will preside on the occasion. All the arrangements have been made, and the festival will take place in Ayrshire, on Thursday, August 1. Two days afterwards, the Highland and Agricultural Society's Show at Glasgow will take place, so that both places will be easily visited. The Edinburgh and Glasgow Railway Company, as well as the Glasgow and Ayr Company, have agreed to give every accommodation, and to afford a passage to and fro on the day of the festival, for a single fare.

Miscellaneous.

Showers of Flies and Frogs.—The *Kelso Mail* states that several persons at Berwick early astir on Tuesday morning, were witnesses to a very singular phenomenon. Between five and six o'clock, what appeared to be a thick mist or cloud, was seen to pass up Sandgate from the Shoregate, extending from the latter about half-way up the street and at the height of the eaves of the houses. It moved at a slow pace, and, when opposite the Salmon Inn, was so dense as to conceal the sign-board from those persons on the other side of the street. At this time a shower of rain fell, and the object gradually descended to the ground. The curious who passed over the street to inquire into the cause of their wonderment, discovered it to have been a body of flies so numerous as actually to blacken the flags where they lay, and so small individually as to admit of examination only by a microscope.—About 3 weeks since, during the heavy rain which fell immediately after the drought, the Liverpool papers state that an immense quantity of pebbles descended upon the Exchange flags, and some eels in Castle-street. The pebbles were all small in size, but of different colours and shapes. The inspector on duty at the Exchange gathered a large number of the pebbles, and deposited them in one of the neighbouring offices, where they have since been very generally admired. The eels were about two inches and a half in length. On the same day, according to the *Leeds Mercury*, during the prevalence of the heavy rain, a shower of frogs fell at Selby. Several of the frogs were caught in their descent by holding out hats for that purpose. They were about the size of a horse-bean, and remarkably lively after their flight. The same phenomenon was observed in the immediate neighbourhood, and in several parts of Lancashire and Chesbire. On Monday fortnight, during the thunderstorm in London and its vicinity, an immense quantity of yellow sand and small white pebbles fell in different parts of the metropolis.

Paper from a New Material.—Almost every succeeding day adds to the resources of practical science, and multiplies the developments of human skill. Paper is now, it seems, to be made from *Wheat straw*; and it is affirmed that both the finest and coarsest qualities can be produced by the new method. The experiment, we hear, is about to be tried on a large scale, mills having been lately taken at Chalford, near Stroud, for that purpose.—*Cheltenham Chronicle*.

The New Comet.—The following letter has been addressed to the *Times* by Mr. Main, first assistant at the Royal Observatory, Greenwich:—"In the absence of the Astronomer Royal, I beg to inform you that the comet recently discovered by M. Mauvais was observed here yesterday evening, July 15. At 10h. 17m. mean solar time its right ascension was 15h. 43m. 5s., and its declination north, 42h. 4m. 14s. It is very nearly circular, having an ill-defined planetary nucleus surrounded by a coma. Its brightness is considerable, and it may be easily found with a small telescope.

The Rev. Dr. Wolff.—Intelligence has arrived by the way of Trebizond, (from whence the dates are to the 24th of June,) announcing the safe arrival at Bokhara of Dr. Wolff, and that he had been kindly received by the Bokharees. No mention, however, is made as to whether he had found the objects of his journey, and therefore the next accounts are looked forward to with anxiety.

Peerage Statistics.—Since the accession of Sir R. Peel's Ministry a considerable decrease has occurred among the hereditary honours of the country. The Dukedoms of Sussex and Dorset; the Irish Marquessate of Wellesley; the Earldoms of Plymouth, Ludlow, and O'Neill; the English Baronies of Rolle, Wellesley, Lynedoch, Wallace, Ludlow, Fitzgerald, and Sydenham; the Baronetcies of Bruce, Cowan, Cromie, Hannay, Johnstone, Mackenzie, Macnaghten, Rae, and Rowley, have become extinct. The Earldom of Mansfield of 1793 has merged into that of 1776. The Viscounty of Ferrand has united with that of Massarene; the English Barony of Arden with Lovell and Holland; the Irish Barony of Arden with the Earldom of Egmont; the Barony of Duncannon with the Earldom of Besborough. During the same period, the Earldom of Abergavenny, the Viscounty of Hereford, the Baronies of Rodney, Berwick, Fitzgerald, and Congleton, have descended to clerical possessors. The Viscounty of Hill is the only elevation; the Barony of Lowther, now merged in the Earldom of Lonsdale, the only addition to the Ministerial party in the Upper House; whilst Sir John Pirie is the only Baronet created since September, 1841. By the demise of the last Earl of Plymouth, the Barony of Windsor has fallen into abeyance between the sisters of the sixth Earl, the Marchioness of Downshire and Lady Harriet Clive, wife of the Hon. R. H. Clive, M.P. for South Salop.—*Standard*.

Farm Buildings Bill.—The Government have just introduced a short Bill, to amend the law as to burning farm buildings. It is prepared and brought in by Sir J. Graham and the Solicitor-General, and contains four clauses only. They enact that whoever shall unlawfully and maliciously set fire to any hovel, shed, or fold, or to any farm building, or any building or erection used in farming land (whether the same shall then be in the possession of the offender, or in that of any other person), with intent thereby to defraud any person, shall be guilty of felony, and on conviction shall be liable, at the discretion of the Court, to be transported beyond the seas for the term of the natural life of such offender, or for any term not less than 15 years, or to be imprisoned for a term not exceeding 3 years. Persons setting fire to any hay, straw, wood, or any other vegetable produce, in any farmhouse or farm building, or to any implement of husbandry therein, with intent to injure or to defraud thereby, will be deemed equally guilty of firing the said farmhouse or farm building. This act is to be deemed a part of the 7th William IV. and 1st Victoria, cap. 89, the provisions of which it merely proposes to extend.

Law.

SUMMER ASSIZES.—NORFOLK CIRCUIT, BUCKINGHAM.—*Uthwatt* v. *Elkins and four others*.—This action was brought to recover the sum of 20*l.* for the use and occupation of certain land situate in Great Linford, in this county. The defendants pleaded that they never were indebted to the plaintiff. The plaintiff is a gentleman of fortune, living at Great Linford, and it appeared that in the year 1833 he and the parish officers were desirous, if possible, to better the condition of their poorer neighbours, by letting small portions of garden ground to such of them as were willing to hire it. For this purpose it was resolved that the plaintiff should lease a plot of ground to the parish officers, and that they should fence it off, and let it in lots to the poor. Two of the defendants were at that time overseers of the parish, other two were churchwardens, and the fifth was surveyor of the highways. In the month of February, 1833, the defendants, in pursuance of the above resolution, executed an agreement, in which they described themselves as churchwardens, &c., and by which they hired the land of the plaintiff for 21 years, and agreed "for themselves, their executors, administrators, and assigns, and their successors," to pay the sum of 20*l.* to the plaintiff during that period. The defendants then divided the land into numerous gardens, which they let to the poor inhabitants of Linford, who entered upon the cultivation of them. The defendants went out of their several parochial offices at the end of the year, and were succeeded by others; and, in like manner, year by year, fresh persons were elected into the several offices. It appeared that the defendants themselves paid to the plaintiff the first year's rent for the land, and year by year the plaintiff received the rent reserved in the lease, and gave receipts to "the churchwardens, overseers, and surveyors," of the parish: those offices, as already observed, being either altogether or partially filled by different persons in each year. This state of things continued until Michaelmas, 1842, down to which period all the rent was duly paid. The year's rent due at Michaelmas in that year being unpaid, the plaintiff applied to the defendants for it, but they denied their liability, and insisted that the parish officers for the time being, who, by means of the poor of the parish, occupied the land, ought to pay the rent; and whether, under these circumstances, the defendants were personally liable, or whether they had executed the lease solely in their character of parish officers, binding only their successors in office, was the question of law involved in the cause. It appeared that two of the defendants had long since left the parish, and were residing at a distance wholly unconnected with it. For the plaintiff it was contended that upon the true construction of the terms of the lease by which the defendants bound themselves and their executors, &c., to pay the rent, they were liable in their individual characters, and not merely during the time of their continuance in office. On the other hand it was argued that, even supposing the surveyor of the highways might be individually liable, still that the churchwardens and overseers (who were enabled by a statute of the 59th of George III. to hire lands for the use of the parish) must be considered to have contracted in their corporate character only, and not as individuals, and that, not being in office during the period in respect of which the action was brought, the plaintiff had sued the wrong persons. It was further contended that the term which the defendants took under the lease (which was not under seal) was surrendered and gone by the plaintiff's having from the year 1834 received his rent from the persons filling the offices of churchwardens, overseers, and surveyors, and not from the defendants. Mr. Justice Williams was of opinion that the plaintiff's construction of the lease was the correct one, and also, that the fact of receiving the rent and giving the receipts as already mentioned, did not put an end to the lease by the substitution of a new contract; but his lordship reserved both points. The plaintiff, therefore, had a verdict, with liberty to the defendants to move the Court in which the action was brought to set aside that verdict and enter a nonsuit in its stead.—AYLESBURY.—*Richard Chandler* was indicted for killing and slaying John Leech, gamekeeper to a gentleman named Curtis, by striking him over the head with a stake, on Monday, the 2d July, in the parish of Bow Brickhill, near Newport Pagnell. John Keen was also indicted for aiding and assisting. The trial lasted a considerable time; but the following are the whole facts of the case:—On the day named the two prisoners were detected by deceased beating for game. The latter interfered, and attempted to take them into custody. Chandler declared that he would not be taken alive, and a severe struggle took place between them and deceased. The latter was getting the better of them, when Chandler seized a stake from the hedge, and, striking the deceased several blows with it over the head, felled him to the earth, and caused his death subsequently. The jury, after being absent some time, returned a verdict, finding Chandler guilty of manslaughter, and acquitting Keen. The judge sentenced Chandler to be transported for fifteen years.—HUNTINGDON.—*Arson*.—*Samuel Baxter*, a respectable little boy, aged 10 years, and not unlike the celebrated General Tom Thumb, having pleaded guilty to a charge of firing four straw stacks, the property of Robert Daintree, of Hemingford Abbots, on the 11th May.—Mr. Wells, on the part of the prosecutor, begged to recommend the youthful incendiary to mercy. His father was his farming bailiff, and had filled that position for eight years with the greatest credit. The prisoner himself was always considered a very deserving boy, and every one was surprised at his having confessed to the perpetration of this crime. His Lordship then called before him the prosecutor and the father of the prisoner, neither of whom could in any way account for the transaction. The boy himself, when asked to assign any reason for his conduct, professed his inability to do so, denying that he had ever been incited to the deed by any one, or that he had any motive. The prosecutor, however, said that he had told him that his reason for doing so was a wish to live in the village, and that he thought the house would be burned as well as the stacks, in which case he and his family must all have gone into the village. To accomplish this wish it would appear that he had thrust a lighted stick into one of the stacks. Mr. Daintree earnestly begged for mercy on the boy, whom he said he had known from his extreme youth, as well as his father. Mr. Baron Alderson—Well, I do not know what to do with him, but I shall not pass sentence on him just now. The boy was then removed, crying bitterly, as well as his father, but having been shortly replaced on a chair in the dock, his Lordship thus addressed him:—Samuel Baxter, your case has given me great pain and difficulty indeed, but I cannot exercise any discretion as a judge. It is for the Crown to do that. We must make the same example for boys as we would for men who commit such an offence as that to which you have pleaded guilty. What circumstances there may be in your favour which her Majesty the Queen may see, I know not, but her advisers may see some such which may induce them to recommend the display of mercy towards you. I can only say that you shall have the benefit of my most favourable recommendation to mercy. At present I can exercise none, but must pronounce the sentence of the law, which is, that you

be transported for fifteen years, and I hope that other boys will take notice of it.

MIDLAND CIRCUIT, NORTHAMPTON.—ARSON.—*William Gardner*, aged 52, was capitally indicted for having, at the parish of Chacombe, in this county, unlawfully, feloniously, and maliciously set fire to the dwelling house of William Hollier, in the night-time, there being no less than six persons at the time asleep therein in their beds. It appeared that the prisoner had been in the service of Mr. Hollier, and on the Sunday preceding Tuesday, the 4th of June, had from some cause or other been dismissed. The prisoner had said that it was in consequence of something between the servant man and the servant girl, and also that he had gone "to murder the servant girl, but the Lord ordered it otherwise." On the Tuesday, the very day of the fire, he had said that he would "do Mr. Hollier some private injury, and the job would be done that night, and then he would make away with himself." On the same day he also went to Mr. Potter, the nephew of the prosecutor, and told him that he had been dismissed by his uncle, "and would do him some private injury—something to be talked about, and he would hear of it before long." This was on the Tuesday, the day on the night of which the fire happened. The prisoner was at a public house till between 8 and 9 o'clock at night, and begged for a halfpenny to buy some ale, and having obtained it, said that it was not for ale he wanted it, but lucifer matches. He was afterwards seen at 9 o'clock, when he said he was going to his home, but he had then passed the turn to his own home and was on the road to the prosecutor's house. At 10 he was seen within a few yards of the prosecutor's, and within a few minutes of this the fire broke out. Search was made for him, and on the following Thursday the police-officer found him, hearing a groaning, in a state of extreme destitution and weakness, in a hovel or cowhouse at some considerable distance from Chacombe. He was weak from loss of blood, and there were two or three severe cuts on his arm. The officer told him that he apprehended him for the fire at Mr. Hollier's, whereupon the prisoner said that he had done no wrong to anybody but himself. On the following day the police officer found in the said hovel two boxes of lucifer matches concealed, and two or three lucifers were found upon the prisoner. There was much further circumstantial evidence of guilt. His Lordship summed up the case with some minuteness, observing that one could not but feel some commiseration for the extreme destitution and suffering of the prisoner, by whatever misconduct he might have brought it on himself, but that it could form little or no excuse for crime, and none, at all events, for such an atrocious crime as that wherewith the prisoner stood charged, if the jury should find him guilty of it. The jury, by their foreman, returned a verdict of Guilty, stating that most of them recommended the prisoner to mercy, on account of his distress at the time; but the foreman did not himself see the reason for such recommendation. The prosecutor also recommended him to mercy on the same ground. Lord Denman proceeded to pass sentence. The jury and the prosecutor had recommended him to mercy on account of his state of destitution and distress. But the house was that of his former master and mistress, the latter of whom he had himself admitted to have been his benefactress. They and all their family were asleep in their beds. Yet, in deference to the recommendation to mercy of the jury and the prosecutor, he should not recommend that his life should be forfeited upon the scaffold, atrocious as was the crime of which he had been found guilty. The legislature had declared that many offences recently capital should be so no more; but this offence, where the lives of persons were so endangered, still remained so; and probably, but for the recommendation of the jury and the prosecutor, founded upon his extreme state of destitution, and that alone, his life would have been forfeited upon the scaffold. Sentence of death would be recorded, but that sentence would probably be not carried into effect; but he would be sent for the remainder of his wretched existence to a penal colony, where he would throughout the remainder of his days suffer infinitely more than he had or could have done in this country; and he hoped that due care would be taken, that if he had, or should have, such a design as that of destroying his own life, he would be so guarded as to prevent him from the execution of such purpose, for it was fitting that he should live as a melancholy example.

OXFORD CIRCUIT, OXFORD.—*Richard Elliott* was indicted for stealing a banker's parcel, containing 1500 sovereigns, from the Defiance coach, on the 18th March last. The particulars of this case were fully stated in this Paper at the time. The evidence on the trial was merely a repetition of that given before the Oxford magistrates, proving that the prisoner and another man joined the coach in London, prisoner sitting behind and the other on the box. Prisoner got down at Benson, where several persons deposed to having seen a man looking into the fore boot, and holding a blue bag in his hand, such as that which contained the box of sovereigns. Some of the witnesses positively stated that prisoner was the man who opened the boot, while others described a person corresponding to the appearance of his companion who sat on the box, and who went on to Oxford and then disappeared. Prisoner is a tobacconist in Bell-street, Paddington. The Jury after some deliberation returned a verdict of acquittal.—ABINGDON.—*The Queen* v. *Joshua Ware*.—The prisoner, a young man of 19 years of age, of respectable appearance, was indicted for having, on the 1st May last, burglariously entered the dwelling-house of the Rev. G. H. Hodson, at Cookham, Berks, and stolen therein some plate and other articles. It appeared that on the night of the 1st May prosecutor's housekeeper, being the latest up of any of the family, ascertained, before retiring to rest, that the doors and windows, and especially the casement and external shutters, through which the entry was made, were properly fastened. Before six in the morning, some neighbours observing the shutters open, and the pane of the casement broken, gave the alarm to the housekeeper, who, on rising, discovered that a robbery had been committed, and took steps to inform the police of it. Sexton, a constable of Maidenhead, went to the house and examined the shutters. He proved that the mode in which the entry had been effected was by turning round, from the outside, an iron pin, which secured the shutter by passing through it and the casement, and causing a piece of iron, or key, which kept that pin from being taken out by running through a slip which was made at the end inside the house to fall out, and by then withdrawing the pin. The shutter, as soon as the pin was out, could easily be opened, and by breaking the pane of glass a person could put in his hand and undo the fastening of the casement. On the same morning the prisoner offered to pawn a silver chalice at the shop of Mr. Viton, pawnbroker, in High Holborn. Mr. Viton inquired his name and residence, to both of which queries false answers were given. The prisoner, on being asked from whom he had obtained the chalice, replied that Mr. Atkins, his uncle, who was cook at Eton College, had given it to him. While the prisoner was at the pawnbroker's shop, a policeman who daily took there the list of stolen property, entered it, and after some time took the prisoner to Bow-street, where an examination took place, which terminated by his being remanded for a few days. Notice of his apprehension was given, and Sexton, the constable, having gone to Bow street, had the prisoner given into his custody to bring to the county goal. While Sexton and the prisoner were waiting for a train at the Paddington terminus, in the course of conversation between them on the subject of the robbery, but the particulars of which the constable could not call to mind, the prisoner said—"They will transport me. Well, one country is the same to me as another." Prisoner was taken before the county magistrates and fully committed. A singular fact is, that prisoner was seen on the 1st May, on the night of which the robbery was committed, at about five P.M., on the road near Gravesend, by a woman named Sarah Towers, who was acquainted with him from having resided some time in the neighbourhood of Cookham. He thus must have travelled by some late train from London on the night of the 1st of May to Maidenhead, gone rather more than three miles to Cookham, committed the robbery, and returned to London by a very early train. Mr. Hodson identified the articles. The Jury found the prisoner guilty, and after an impressive address his Lordship sentenced him to transportation for ten years.

COURT OF BANKRUPTCY.—*In Re William Bromley.*—The bankrupt in this case had carried on business as a solicitor and money scrivener, in Gray's-inn, and had lately failed for a sum of 140,000*l.* The proceedings at the different hearings have been fully reported in the papers, and Monday was fixed for hearing counsel on behalf of the bankrupt, in explanation and mitigation of the charges made against him. In pursuance of that order, Mr. Sturgeon appeared for the bankrupt, and in a pathetic address to the Court said that his client, the bankrupt (who had been solicitor to Earl Grey), had been unfortunately tempted to enter into various speculations, in the full confidence that he would be enabled to realise a fortune, and in those moments of temptation he had applied money to his own purposes which had been placed in his hands with other intentions. But he had not done so without reasonable expectation of being able to replace the sums so applied, for at this time his professional exertions brought him in an income of between 2000*l.* and 3000*l.* per annum, and the rental of various properties which he then held yielded between 5000*l.* and 6000*l.* a year. The bankrupt had given, when on a bed of sickness, a warrant of attorney to Captain Blair, and when he found that warrant about to be put in execution, he himself caused this fiat to be issued, in order that his assets might be equally distributed, and that no one creditor should obtain a preference at the expense of the general body. He could assure the Court that the bankrupt's property had cost him upwards of 120,000*l.*, the whole of which will come to the creditors.—Sir C. F. Williams: I should be very glad if 120,000 half-crowns would come to the creditors.—Mr. Humphreys, who represented the assignees, here said, that there would not be one shilling in the pound.—Sir C. F. Williams said: The question is, if I be satisfied with the bankrupt's balance sheet to such an extent as to enable him to "pass" upon it, to which I must at once say, after a most careful—and I am sorry to say a most painful investigation of it—I most decidedly give my judgment in the negative. I have paid every attention to the feeling and pathetic address of the learned counsel in favour of the bankrupt, but still I must say that he has not altered or explained any one item in the balance sheet, nor any portion of the gross misconduct of Mr. Bromley: and I might use a much more appropriate and harsher expression than misconduct, if I were not presiding in a court of justice. I do not think the creditors ought to be satisfied with the balance sheet, and in all my experience I never met a case so adverse to a bankrupt as the present. A man might at once, and by some sudden emergency, be plunged into difficulties; he may feel alarmed at the sudden touch of the sheriff's officer, or a hundred other imaginable cases, and do under such circumstances what his better nature and his more sober senses would afterwards recoil from; but in this case no such excuse can by any possibility be pleaded. Here is a man of mature age, and of considerable experience, having had besides extraordinary confidence reposed in him, and yet he carries on his frauds (for they are unquestionably frauds) over a period of from ten to thirteen years, and those, too, to a most blameable, enormous, and unwarrantable extent. Now, let me be allowed to add a word here, that if there be one avocation in society which more than another requires the exercise of honour, integrity, and discretion, it is that of a solicitor. Persons in every class, and for almost every purpose of life, have at some time or other occasion to fly to the solicitor for advice; but the conduct of the bankrupt has, I am sorry to be compelled to say, shed a blighting influence over his branch of the profession. His misconduct was not the result of a moment, but extended over, and was the deliberate result of many, many years. There are as many and as upright men solicitors as in any other profession, and hence they must feel the more, inasmuch as for the future their character for integrity may be assailed, if unfortunately it be not destroyed. I do not find upon the face of the balance sheet here, that the bankrupt had one shilling of capital at the time when it commences, about one year ago; but I do find the startling admission that the debts amount to 141,522*l.*, out of which there are creditors without any security to the amount of 86,791*l.*, and creditors holding security only in the sum of 455*l.* 15*s.* Now this must appear to the creditors, and to all the world, to be a frightful state of things, and it is also quite clear that Mr. Bromley had engaged in such extraordinary courses of business as to leave him now indebted in the enormous sum of 86,791*l.* If, in addition to this, it be true that he derived an income from his profession of 3000*l.* a year, I fear it will be found that his improvident outlay, and misappropriation of his creditors' money, will amount to no less than 15,000*l.* a-year. True, it is also said upon this balance-sheet, that his property amounts to 120,517*l.* 7*s.*; but I verily believe that, out of this apparently enormous sum, not 6000*l.* will be realised for the creditors. The slightest glance at the bankrupt's misappropriations, not only as exhibited on the face of the balance-sheet, but as admitted upon the bankrupt's own evidence upon oath, will more than confirm the few observations which I have already felt it my duty to make upon this extraordinary case. Here I find an alleged mortgage by Chuleb to Mr. Wilkinson, who was Mr. Bromley's friend and benefactor; and how has he repaid it? Why, by pretending that it was advanced to a Mr. Throughton (3500*l.*); and what was really done with it? It was placed to Bromley's own account; and to make the transaction the more culpable, it was entered in Throughton's name, and the interest credited to him, as if it were a *bonâ fide* matter. Nor was this all, for the deed was sent to Dr. Lushington—the pretended deed—for no deed was ever really executed; and the whole turned out to be a decided fabrication. The bankrupt's is not a case to excite pity or compassion. Look again at his conduct to Archdeacon Brymer. That most respectable gentleman may not possibly suffer to the amount of ruin which has fallen upon others, because of his having a private fortune; but how can I recur to that of a poor woman, who was not only deprived of a competent means of support for life, but was obliged to resort to the parish for a loaf; and the very mention of whose case the other day produced a shriek of horror in a crowded court? Again, the bankrupt alleged that he lent Mr. Ker 3000*l.*, when the fact was that that respectable gentleman had never borrowed a single shilling. Again, I find that the mortgage to Cooke was released for 4000*l.* upon his paying it in. It was afterwards alleged that that sum had been lent to Bernal; but what was the result? Why, that it all went into the hands of Mr. Bromley himself. The executors in the case of Mr. Wilkinson never thought human nature could be so base as to imagine such gross misconduct, and the whole of these moneys had been swamped by the bankrupt. But why multiply cases where there is nothing to extenuate such gross misconduct, and nothing to relieve so many suffering creditors? However, these extraordinary transactions should act as valuable admonitions to society in general not to trust themselves or their property to the management of any man's hands without seeing that they were properly secured. There never was worse conduct than that of the bankrupt in relation to Mr. Wilkinson. The deeds for 9000*l.* were deposited in a tin box at Messrs. Child's, and within three months after his death he got them back, used them to his own purpose, and never returned them. The recital of these things creates horror. If the learned counsel had even proved that in these transactions the bankrupt had done any act of generosity or munificence, it would have had nothing to do with this case, where families have been brought from comparative affluence to dependence, and from enough to a loaf. Compassion was claimed for the bankrupt upon the ground of the extent of his speculations. Now, my answer is, that before he indulged in this lust for speculation, he should have looked into his banker's book, and not have dipped his hands into the pockets of his friends, his benefactors, and his clients. In this case, to the sorrow of the creditors, the property which the bankrupt states to have cost 120,000*l.*, has been so spun out in order to raise money, so divided, and so subdivided, that I do not believe it will yield more than 5000*l.* to 6000*l.*, for the whole of the property, even to the homestead and pigstye, have been pledged, I fear, to their full value. After some further observations the commissioner ordered an adjournment, at the bankrupt's expense, for the 28th October, when an amended balance-sheet is to be furnished.

BIRTHS.—On the 9th inst., at Hadley, Middlesex, the lady of the Rev. J. E. KEMPE, M.A., of a son—11th inst., at Eignbrook, Hereford, Mrs. E. WHITE, of a son—11th inst., in Cumberland-terrace, Regent's Park, the lady of J. T. E. HAMILTON, Esq., of a daughter—12th inst., at 29, Grosvenor-square, the COUNTESS OF HOME, of a daughter—12th inst., at Wimbledon, the lady of Major OLIPHANT, of a daughter.

DEATHS.—On the 30th of April last, at Prince's Island, of yellow fever, T. J. FEAD, Esq., commander of the ship Gloucester, youngest son of Lieutenant-Colonel Fead, C.B., late of the Grenadier Guards, aged 25—4th inst., on board the Great Liverpool steam-ship, on his voyage from Alexandria, W. JAMES, Esq., of the Hon. East India Company's Medical Establishment, son of the late W. R. James, Esq., of Aldborough, aged 24—5th inst., at Assembly-place, Mile-end, Mr. W. MALTBY, aged 64—10th inst, at Shelton Rectory, Norfolk, the residence of his youngest son, the Rev. S. CURTEIS, LL.D., formerly of Queen's College, in the University of Cambridge, aged 77—10th inst., at the Rectory, Appleton, Berks, the Rev. J. W. HOSKINS, D.D, Prebendary of Wells Cathedral, above 40 years rector of Appleton, and formerly Fellow of Magdalene College, Oxford, aged 84.

IMPORTANT.—One of the most respectable Firms in Paris is desirous of obtaining an active and intelligeat Agent in every trading town of Great Britain (London excepted), for the management of a Business of Infallible Benefit, proportionate to the diligence with which it is conducted. The habits of a Merchant are not indispensable, nor is any advance of funds required, but merely the qualifications of Diligence and Integrity.—Direct, post paid, to Z. B., Mr. DEACON'S, 3, Walbrook. All applications must be accompanied with a reference to respectable parties, and an answer will be sent to the applications as soon as possible.

A YOUTH of good Education, and of respectable parents, wanted as an Apprentice in a Nursery and Seed Establishment in the vicinity of London, where a general stock is kept, particularly in the Plant department. A considerable premium will be expected.—Direct to Messrs. WARNER, Seedsmen, London-bridge, stating age, &c.

A VACANCY occurs in a first-rate Nursery and Seed Establishment, near London, for a highly respectable Youth as an Apprentice. A Premium required.—Direct to Hortus, at the Office of this Paper, 5, Charles-street, Covent Garden, London.

WANTED a GAME-KEEPER.—A Single Man who has had long experience in Rearing and Breeding Pheasants, &c. He will be required to fill up his time by assisting in the Garden, or as a jobbing Carpenter. Full particulars of former places, age, and lowest wages required (no other will be noticed).—Direct to A. B., at Mr. Manicorn, Baker, South Molton-st., Oxford st.

WANTED, a person who thoroughly understands the propagation and cultivation of hardy trees and shrubs, to proceed to America to take charge of that department in a large Nursery Establishment, near New York. Some acquaintance with the culture of greenhouse plants is also required, but a knowledge of the former branch is particularly wished. Applicants can forward immediately to George Charlwood, Covent Garden, their address, with the necessary references as to qualifications. None but those of steady and industrious habits need apply.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, where one or more are kept.—A Married Man, aged 50, without family, whose abilities and character will bear the strictest investigation from the Gentleman he has lived with upwards of 20 years; no objection to look after land if required.—Direct to A. B., at Mr. G. Rangecroft'-, Sheet-street, Windsor.

AS GARDENER, or GARDENER and BAILIFF.—A Married Man aged 38, without incumbrance, who perfectly understands Horticulture in all its branches; every satisfaction can be given as to his abilities, and 9 years character, from the lady he has left.—Direct to J. B., Mr. Fuller, Nurseryman, Chertsey, Surrey.

AS GARDENER, or GARDENER and BAILIFF.—A Single Man, aged 35 years, who perfectly understands his profession in all its various branches, also the Norfolk and Essex mode of Farming, with a good knowledge of Stock; can be highly recommended by the gentleman with whom he lived seven years, and has no objection to live in the house or out.—Direct to W. W., at Mr. Batten's, Brook-street, Upper Clapton.

AS GARDENER, and to take charge of a Horse and Chaise.—A Respectable Young Man who can milk a Cow and make himself generally useful; can have an unexceptionable character from the situation he is about to leave.—Direct to A. B., Mr. Brown's, 5, Albert-place, Wandsworth, Surrey.

AS GARDENER.—A Married Man, who perfectly understands his profession in every department, and can have nearly three years character from the situation he is about to leave. His Wife has no objection to take charge of Dairy or Poultry.—Direct to G. C., Post-office, Harrow.

AS GARDENER.—A respectable Young Man, 23 years of age, who perfectly understands his profession; can have a good two years' character from the gentleman he has just left. A single-handed place.—Direct A. B., care of Mr. Austin, Gardener, Beddington-park, near Croydon, Surrey.

AS GARDENER.—A married Man, aged 40, who perfectly understands his profession. His wife could take charge of Poulty, the Dairy, and Bake.—Direct to Mr. ELLIS, Sutton Place, Ripley.

AS GARDENER, or GARDENER and FORESTER, with the Management of a small Farm, if required.—A single middle-aged Man, a native of Scotland, who can have the most unexceptionable and satisfactory character for professional ability and propriety of moral conduct from his last situation, where he lived nearly 20 years. Wages not so much an object as a comfortable situation in a respectable family. All letters directed to W. R., care of Messrs. HURST and M'MULLEN, Seedsmen, Leadenhall-street, will be promptly attended to.

AS GARDENER.—To board in or out of the house, a single Man, aged 38, who understands his business in all its branches, including Orchideæ. Can have a good character from the place he has just left.—Direct, A. B., Mr. COOPER, Paragon Nursery, Brixton-hill, Surrey.

TO GUANO MERCHANTS, &c.

A YOUNG MAN, of business habits, wishes for an engagement, either on Commission or otherwise; has an extensive connexion among Nurserymen, Horticulturists, &c. Respectable reference will be given.—Direct to J. M., Post-office, Paddington.

THE COUNCIL
OF THE
Horticultural Society of London

HAVING ascertained that a very large number of Exhibition Tickets of the present season have not been used, chiefly on account of the unfavourable weather of the 13th—the last day fixed for the Exhibitions; and

HIS GRACE THE DUKE OF DEVONSHIRE,

the President of the Society, having most kindly offered again to throw open the grounds of Chiswick House,

NOTICE IS HEREBY GIVEN

That there will be on Wednesday, the 31st of July, a MUSICAL PROMENADE in the Society's Garden, at which the unused Tickets of the present season will be received. Other Tickets for the occasion will be issued till the 30th inst., at the Office, price 3*s*. 6*d*. each, or at the Garden on the 31st ins., at 5*s*. each; under the regulations already in force for governing admission to the Exhibitions at the Garden. The usual refreshments will be supplied by Messrs. Gunter,—21, Regent-street.

ARRANGEMENTS TO BE OBSERVED BY THE
MILITARY BANDS
IN THE GARDEN OF THE HORTICULTURAL SOCIETY,
July 31, 1844 (*weather permitting*).

The Bands of the 1st Life Guards, Royal Horse Guards, Coldstreams, Fusiliers, Royal Artillery, and Sappers and Miners, will take their stations in the Society's Garden by 1 o'clock, when the five first will commence playing as usual, and the Sappers and Miners will proceed at once to their position at the Duke of Devonshire's. At 20 minutes to 2 P.M. the Bands in the Society's Garden will march from their several stations to Rhone Terrace, where they will play the *Overture to Zampa*. At the conclusion of this piece the Coldstreams and Royal Horse Guards will file off in two divisions into the Grounds of His Grace the Duke of Devonshire. The 1st Life Guards, Artillery, and Fusiliers will remain in the Society's Garden. At half-past 3 o'clock the 1st Life Guards, Fusiliers, and Royal Artillery will move into the Grounds of Chiswick House, where all the Bands will collect and play the *March in Oberon*. After this the Bands will resume their former stations. Shortly after 5 P.M. the Bands in the Duke of Devonshire's Grounds will march back to the Society's Garden in two divisions, and joining the Artillery, Life Guards, and Fusiliers, the whole will again collect in the orchestra. Thus united, the Bands will play the *March Triomphale of Ries*, the *Overture to Fra Diavolo*, and the *Prince of Wales's March*, by Costa, the whole concluding with *God Save the Queen*, as newly arranged by Costa. At the conclusion of these pieces the Bands will quit the Garden. In the intervals between the concerted pieces the Bands will play separately, as usual. In all cases, when the Bands move from place to place, they will march, playing the *British Grenadiers* in E flat.

*** The concerted pieces will be conducted alternately by the Bandmasters of the five principal Bands.

THUNBERGIA CHRYSOPS.

W. SKIRVING, Nursery and Seedsman, Walton, near Liverpool, begs to offer the above new and splendid Climber, surpassing in beauty all others of the genus yet introduced. It is a native of Sierra Leone; a perennial of strong and shrubby habit, and a free bloomer. Colour, dazzling purple, with rich yellow eye. Raised at Knowsley Hall, from seed imported by the Right Hon. the Earl of Derby, and presented to W. S. by his lordship. Plants are now ready to be sent out at 10*s*. 6*d*. each.

Orders accompanied with a remittance or a respectable reference, will be faithfully and promptly executed.—Walton Nursery, 25th July, 1844.

SHILLING'S QUEEN CABBAGE.—This month and part of August being the time to sow Cabbage Seed for the Autumn and Spring Planting, J. & S. SHILLING having a little seed left of the above very superior kind, which they highly recommend, to those who have not already tried it—beg to offer it to the Public generally, in half oz. packets, postage free, at 2*s*. 6*d*. each, on the receipt of postage stamps or a Post-office order.—Northwambro' Nurseries, Odiham, Hants.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

NURSERYMEN AND FLORISTS TO HER MAJESTY THE QUEEN.

YOUELL AND CO.'s splendid and extensive Collection of CARNATIONS, PICOTEES, and FUCHSIAS is now in Bloom, to which they beg to invite the attention of Amateurs and others. Upwards of 3000 pots of Carnations and Picotees will be staged, comprising all the leading varieties in cultivation, and embracing several new Picotees of the highest merit, raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, to which first-class Prizes have already been awarded.

Steamers from London Bridge and St. Katherine's Wharf every Tuesday and Saturday evenings at 6 o'clock. Coaches from Spread Eagle, Gracechurch-street, *viâ* Eastern Counties Railway every morning and evening at 8 o'clock.

Great Yarmouth Nursery, July 25, 1844.

THE BEST 24 VERBENAS EVER OFFERED, for 21*s*., or TWELVE for 12*s*.

GEORGE SMITH begs to offer the following splendid VERBENAS, which comprise the choicest varieties of the season; they were shown at the Royal Botanic Gardens of London, and much admired for their distinct colours and fine form; they also obtained the first prize. Smith's Array, Excelsa, Delicata, Striata, Parson's Beauty Supreme, Atro sanguinea, Celestina, Princess Alice, Miller's Blue Queen, Zeuxis, Youell's Brilliant, Monrock, Surprise, Elegance, White's Wonder, Variabilis, Surprise, Modesty, Simperii, Orange Perfection, Howardii, Variegatus, Poulii, Ingramii, Ignea, Ignescens, Van Gentii, Hislopeana, Ne plus Ultra, Renown, Boule de Feu, Stewartii, Princess Royal.

Tollington Nursery, Hornsey-road, Islington, near London.

FUCHSIAS.

W. MILLER'S Splendid Collection of the above beautiful tribe of Plants are now in full bloom, comprising all the new varieties sent out this season, beside a number of Seedlings raised in the Providence Nursery, Ramsgate.—Admission Gratis (Sunday excepted). July 24, 1844.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD SUSSEX.

SUPERB NEW FUCHSIAS, PETUNIAS, VERBENAS, &c.

WILLIAM WOOD AND SON have much pleasure in offering the following selection of the above, in fine condition for autumnal flowering, strong plants of which are now ready for sending out.

FUCHSIAS.

	each.—*s*.	*d*.		each.—*s*.	*d*.
Attractor (Standish)	7	6	King John (Hally)	3	6
Boydii (Hally)	3	6	Lindleyana (Youell)	5	0
Colossus (Standish)	7	6	London Rival (G. Smith)	5	0
Conductor (do.)	5	0	Marginata (Hally)	2	6
Coronet (Smith's)	5	0	Neptune (Smith)	5	0
Expansa (do.)	5	0	Reflexa (do.)	5	0
Fair Helen (Hally)	3	6	Vesta (do.)	5	0
Gigantea (Smith)	7	6	Wat Tyler (Hally)	3	6

Also the under-named, at 12*s*. per dozen, the selection being left to the purchaser; or one plant of each for 20*s*.:—Alata, Belliana, Britannia, Brockmanii, Champion, Cormackii, Defiance, Eclipse, Enchantress, Eppsii, Exoniensis, King, Lanceii, Majestica (Smith's), Nobilissima, Paragon, Pulcherrima, Rogersiana, Robusta, Smithii, Spectabilis, Stanwelliana, Transparens, Victory. And as under, when the selection of sorts is left to themselves.

12	Extra fine varieties for		9*s*.
25	Do. do.		16*s*.
50	Do. do.		30*s*.

PETUNIAS.

	each.—*s*.	*d*.		each.—*s*.	*d*.
Formosissima (Smith's)	1	6	Lady of the Lake (Smith's)	1	6
Kentish Beauty (do.)	1	6	Magna Purpurea (do.)	1	6
Lady Hope (do.)	1	6	Punctata (Miller's)	1	6

Fine named varieties at 6*s*. per dozen, when the selection of sorts is left to W. W. & Son.

VERBENAS.

	each.—*s*.	*d*.		each.—*s*.	*d*.
Adonis (Croft)	2	6	Delicata (Smith's)	1	6
Azurea grandiflora — (Stewart's)	2	6	Elegans (Youell's)	2	6
Array (Smith's)	2	6	Excelsa (Smith's)	2	6
Blue Queen (Miller's)	3	6	Monarch (Youell's)	2	6
Brilliant (Youell's)	3	6	Queen of the Whites (Stewart's)	2	6
Carnea superba (Stewart's)	3	6	Surprise (Youell's)	2	6
Defiance (Girling's)	2	6	Zeuxis (Miller's)	2	6

Also the following fine varieties, at 9*s*. per dozen, the selection being left to the purchaser, or one plant of each for 12*s*.:—Amethystina, Barnsii, Beauty, Bishopii, Boule de feu, Bridesmaid, Burleyana, Fortune-teller, Harlequin, Howardiana, Joan of Arc, Laconii, Minstrel Boy, Renown, Rival King, Speciosa, Taglioni, White Perfection.

W. W. & Son have also on hand an extensive collection of Camellias, Miscellaneous Plants, &c., priced Catalogues of which may be had on application.

*** Agents by appointment for the sale of WHITNEY'S TRANSPARENT COMPOSITION, for covering Greenhouses, Frames, &c. Sold in bottles—pints 2*s*. 6*d*., quarts, 4*s*. 6*d*. each, with printed directions for use.

NEW PANSY-SEED

WILLIAM CLARK, 25, Bishopsgate-street Within, London, is now sending out SEED just gathered, warranted from the best flowers, and can confidently recommend the same, knowing the kinds collected from. In papers of 2*s*. 6*d*. and 5*s*. each. Also J. H. Cox, Esq.'s superb PICOTEE-SEED, 5*s*. per paper. Very fine Calceolaria from the first flowers, 1*s*. and 2*s*. per paper. Cineraria, from 12 best varieties, 1*s*. per paper. Geranium, fine mixed, 1*s*. per paper. May be had, on receipt of a Post-office order.

ORCHIDACEOUS PLANTS.

LOUIS VAN HOUTTE, Horticulturist to the King, begs leave to inform the Trade and Public in general, that the Parts No. 13, 14, 15, and 16, of his General Catalogue, with the prices of the Plants and Seeds ready for sale at his Establishment at Ghent in Belgium, may be obtained on application to Mr. Geo. Rahn, Crescent, Minories, London. L. V. H. would willingly take Orchideæ in exchange to any amount, on the party proposing such an exchange giving him a correct statement of the price and strength of the Orchideæ.

Note.—All Letters to Belgium must be post-paid.

T. AND J. BACKHOUSE, Nursery & Seedsmen, York, beg to offer to the public strong plants of the following new and rare species:—Achimenes picta, 10*s*. 6*d*.; Aristolochia gigas, 10*s*. 6*d*.; Lisianthus nigrescens, (small) 2*s*. 6*d*.

T. and J. B. have also a good stock of Lisianthus Russellianus, Phlox picta, Van Houttii and bicolor, 1*s*. 6*d*. each; Achimenes hirsuta, 2*s*. 6*d*.; and Pentstemon Murrayana, 2*s*. 6*d*.

MESSRS. J. and H. BROWN are now sending out to any part of the kingdom the following very desirable Plants for bedding out, &c.:—

Angelonia grandiflora, 9*s*. per doz.
Verbenas, 12 best new sorts, 6*s*. per doz.
Torenia scabra, 6*s*. per doz.
Petunia punctata, 9*s*. per doz.
Do., three new Seedlings, superior varieties, 1*s*. each.
Scutelaria splendens, 9*s*. per doz.
Phlox Drummondii, 4*s*. per doz.
Lantana crocea speciosa, 9*s*. per doz.
Fuchsias, all the leading varieties, 9*s*. and 12*s*. per doz.
Rosa Devoniensis, 12*s*. per doz.
Yellow China Rose, White do. do., Smith's Yellow Noisette Rose } 9*s*. per doz.
Fine new Buff Rose, "Eliza Sauvage," 18*s*. per doz.
Fine new Yellow Carnations, 3*s*. per pair.
Chrysanthemums, newest and best vars. by name, 9*s*. p. dz.
Bouvardias, four varieties, 6*s*. per doz.
(The above plants can be sent Post-free.)
Fine blooming plants of Achimenes grandiflora, longiflora, pedunculata rosea, and hirsuta, 6*s*. and 9*s*. per doz.
Gesnera zebrina and elongata, 1*s*. each.
Do. tubiflora, fine new white, 2*s*. 6*d*. each.
Cape Jasmines, 12*s*. and 18*s*. per doz.
Fine plants of Double White and other new sorts of Camellias, well set for bloom, 28*s*. per doz.
Fine Cineraria, Calceolaria, and choice Geranium Seed, 1*s*. 6*d*. per packet.—Albion Nursery, Stoke Newington.

NEW SEEDS.

J. G. WAITE, Seedsman, &c., 1 and 4, Eyre-street-hill, Hatton Garden, London, in expressing the pleasure he derived (during his late journey) from the praises bestowed on the Seeds he had sent out during the past season, begs to return thanks for the very liberal support he has had from the Country Trade, and to inform them that he has just received the undermentioned New Seeds from his Growers, the whole of which he can warrant genuine, being from his own transplanted stocks:—

	s.	*d*.		*s*.	*d*.
Early Stubble Turnip, per bush.	21	0	Large York do., Superior		
,, Stone do. ,,	21	0	Early Dwf. York do., Nonpareil do., Emperor do., Sugarloaf do., per cwt.	£8	0
True White Globe do. ,,	21	0	Red Dutch Cabbage p.lb.	2	8
,, Green do. do ,,	21	0	Early Cauliflower ,,	6	6
,, White Round do. ,,	18	0	Bath Cos Lettuce ,,	5	0
,, Green do. do. ,,	16	0	Brown Dutch do. ,,	2	0
,, Red do. do. ,,	20	0	New Hardy Green Cos ditto, per lb	5	0
,, White Norfolk do. ,,	18	0	Hardy Green Cabb., do.	2	6
Dale's Hybrid Turnip ,,	24	0	Lisbon Onion ,,	1	9
Purple-top Scotch do. ,,	28	0	White Spanish do., ,,	2	3
Waite's Incomparable Cabbage, per lb.	4	0	Green Curled Endive ,,	3	0
Hay's Early Dwarf ditto. per lb.	2	6			
Hope Cabbage, per lb.	2	0			

And all other sorts. N.B.—The above prices are for cash only.

NEW THUNBERGIAS—ALATA SUPERBA AND AURANTIACA SUPERBA.

JOSEPH FRYER begs respectfully to call attention to his Advertisements in the two last weeks' *Chronicles* relating to the above two new and beautiful varieties of Thunbergias, &c., which he will begin sending out on the 1st of August (they may be seen in bloom at the Nursery, or blooms will be forwarded on application, containing 8 postage stamps).

*** Agent for Potter's Guano, Humphreys's Compound, and Whitney's Transparent Composition.

Clarendon Nursery, Camberwell, London, July 26, 1844.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith*.

"I write to describe the wonderful efficacy of POTTER'S LIQUID GUANO; Peas, Onions, and Asparagus have been singularly improved by it. People came to admire the appearance of the garden."—See *Chronicle*, p. 406.

*** Beware of an inefficacious imitation. See *Chronicle*, p. 405—"Humphreys's Compound."

Sold by most Chemists and Seedsmen.

Factory, 28, Upper Fore-street, Lambeth.

LYNDON'S PATENT SPADE.—Sold by Green and Constable, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests. Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d	s. d	s. d		
10	1 5	20	7 0	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, July 26, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

GUANO.—Having been appointed agents for some of the largest Importers, we will be happy to treat with Merchants or Consumers, for delivery at any Port or Inland Town in the kingdom, at such seasons of the year as may be desired. Orders from houses for the Continent will also receive prompt attention, and every facility for delivery. As we sell cargoes direct from the place of loading, an unadulterated article, in either large or small quantities, may be relied on—a matter of the greatest importance to country dealers, whose interest is to secure the farmer's confidence. Commissioned agents: C. HERRING, BURNESS, & Co., 61, Cornhill, London; G. and A. HERRING, South John-street, Liverpool.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones	p. ton	£4	10*s.* 0*d*	Nitrate of Potash	„	£1	4*s.* 6*d*
„ crushed, 5*l.* 10*s.* to		6	0 0	Oil of Vitriol, or Sulph. acid	p. lb.	0	0 1

Gypsum	„	2	0 0				
Nitrate of Soda, p. cwt.		0	14 9				

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

TANNER'S VITREOUS FLUID and CLOTH, a Substitute for Glass for Horticultural Purposes.—The Vitreous Cloth proves its superiority over Glass, by producing the light most suitable to vegetation, superseding the necessity of any shading, preserving a healthy moisture on the plant, retaining its bloom to a more lengthened period, less expensive, and not requiring so much attention. The above (retaining heat) is preferable to Glass for Hothouses, &c., the temperature of which is maintained with less fuel. It is equally applicable as a covering for Fruit-trees, preserving them from frost, blight, and excessive heat. The Vitreous Cloth, made by machinery, is much superior to any prepared in a different manner. By the use of the Vitreous fluid, the Cloth (after lengthened service) may be renewed.

The Fluid sold in bottles 2*s.* 6*d.* and 4*s.* 6*d.* The Cloth 2*s.* 6*d.* and 3*s.* per yard. Manufactured by N. W. TANNER, Chemist, Exeter. Agents for Exeter and vicinity, Messrs. LUCOMBE, PINCE & Co, Exeter Nursery.

To Mr. N. W. Tanner—Sir, we have used your prepared Cloth, and have pleasure in informing you that whilst the light admitted through it is very suitable to vegetation, there has been no necessity to have recourse to any extra shading during the very clear, bright weather which we have so long experienced; this we consider an important point. Yours, &c.

(Signed) LUCOMBE, PINCE, & Co., Exeter Nursery.
June 21, 1844. *** Respectable Agents required.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

GREAT NATIONAL CATTLE SHOW OF IRELAND.

THE SOCIETY'S THIRD GREAT AGRICULTURAL MEETING, and Exhibition of Breeding and Fat Stock, Horses, Sheep, Swine, Flax, Wool, Butter, and Agricultural Implements, &c., open for General Competition will take place on Wednesday and Thursday, the 14th and 15th days of August next, at the COBOURG GARDENS, Harcourt-street, in the City of Dublin.

Wednesday, the 1st of August, will be the last day for serving Notices of entry for Stock, &c., and Premium Sheets, and Blank Forms of Entry can be had, on application to the Secretary, at the Society's Rooms, 27, Upper Sackville-street, by whom they will be forwarded.

All Persons desirous of exhibiting Farming and Agricultural Implements are requested to send in Lists and Descriptions of the different articles to the Secretary, on or before the 1st of August, in order that they might be published in full in the Catalogue.

THE FIRST OR COUNCIL DINNER will take place in the Round Room of the Rotunda, on Wednesday, the First Day of the Show, when the Marquess of Downshire, Chairman of the Council, will preside.

THE GRAND BANQUET will be held on Thursday, the 15th of August, in the Theatre Royal, Hawkins's-street, on which occasion His Grace the Duke of Leinster, President of the Society, supported by the different Noblemen, Vice-Presidents, and Members of the Council, will fill the Chair. The Dress Boxes will be appropriated exclusively to Ladies.

The Premiums to be distributed on this occasion will amount to upwards of ONE THOUSAND POUNDS, and every facility will be given to the Exhibitors of Stock and Implements.

The AGRICULTURAL CHALLENGE CUP, Value ONE HUNDRED SOVEREIGNS, and now held by Geo. A. Grey, Esq., by his Short Horned Bull, Recruit, will be also challenged at the Meeting.

There will be an Auction of Stock in the Show Yard after the Show.

Places at the different entertainments will be specially reserved for strangers attending the Meeting.

The Society's Annual Report for 1843, and first part of its Transactions, are now ready for distribution, and may be obtained by members free, or by non-subscribers at One Shilling a Number, on application to Messrs. Curry and Co., Dublin; Frazer, Edinburgh; and Longman, London, the Society's publishers, who are making the necessary arrangements for its circulation all through the Kingdom. By Order, EDWARD BULLEN, Secretary.

Society's Rooms, 37, Upper Sackville-street, Dublin.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non conductor, it has been proved an efficient Protective Materia to Plants, and is now in use at the Royal Horticultura Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Wd Engines, Baths, &c. Houses, &c. Heated by Hot Water.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS Worcester; Messrs. BARCLAY and SON, Farringdon-street and the principal Oil and Italian Warehousemen in London and Retail by the usual venders of Sauces.

PRESERVES and CONFECTIONERY.—The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18*s* per Gallon, exclusive of the price of the Jar; and in Glass Bottles, at 20*s.* per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, JUN., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

FARMING INVESTMENT IN FRANCE.

TO LET ON LEASE for a long term, in the department of Soane and Goire, a FARM of 1250 ACRES, more than half consisting of Meadow Land, watered by two rivers. Situated about seven miles from a principal Town of 11,000 Inhabitants, and traversed by a main road through its broadest extent. The annual rental of the Arable Land, to be let at the rate of 8*l.*, (6*s.* 8*d.*) per acre; the Pasture Land at the rate of 60*l* (2*l.* 8*s.* 4*d.*) If preferred by the occupant, the uncut standing Grass might be purchased at the rate of 20*l* (16*s.* 8*d.*) for 500 kilograms (1000 pounds weight), for the first crop, and at the rate of 10*l*. 8*s.* 4*d.*) for the 2d and 3d crops. The Proprietor would erect, at his own expense, the out-buildings required.

For further particulars, application to be made in London to G. B., personally, or by letter, No. 11, Manchester-street, Manchester-square.

DODLANDS NURSERY, Maresfield, near Uckfield, Sussex.
VERBENA HUDSONII.

WM. WOOD AND SON, having purchased the entire stock of the above magnificent VERBENA, beg ave to solicit attention to Dr. LINDLEY's opinion of it in the *ardeners' Chronicle*, July 6th, p. 448.

"*W. W.* HUDSONII is a good variety, bright rosy purple, ith a white eye, distinct in colour." To which description *N. W. & S.* may be allowed to add, that the flowers are large nd very showy; it has been seen by several competent judges, who have pronounced it to be a variety of first-rate merit. Plants will be ready for sending out on the 29th August next, packed in tin cases and forwarded post free, at 3s 6d each, with the usual allowance to the Trade when six plants or more ar taken at once.

A remittance will be expected from unknown correspondents.

The Gardeners' Chronicle.

SATURDAY, JULY 27, 1844.

MEETING FOR THE TWO FOLLOWING WEEKS.
Tuesday, Aug. 6 Horticultural . . . . 3 P.M.

ONE of the most curious things in cultivation is, that disputes should arise respecting the MODE of CONDUCTING OPERATIONS that must have been employed from the beginning of gardening; and that now, when so much real progress has been made in tracing effects to their causes, there should still be need of experiments to determine the nature of the very simplest phenomena.

Some of our readers may have remarked the commencement of a little discussion as to whether the sun will burn leaves recently moistened. Our answer has been, that it is a disputed question, and requires further examination. We have, we confess, made that reply in deference to the opinion of many excellent gardeners, who, when they find their Vine leaves scorched, ascribe it to the leaves having had water standing on them when the morning sun has reached them. For ourselves, we entertain grave doubts as to the fact, for this simple reason, that when leaves are wetted by a sudden storm in the open air, even in the spring, and at noontide, when the sun is strongest and the leaves most tender, no scorching follows. Nobody ever heard of such a thing as wet leaves being scorched by the sun in the open air. It is only in glass houses that the mischief happens. How can that be?

That Vines are often scorched under glass, we all know too well; that the scorching may have followed the exposure of wet leaves to the sun, is possible enough; but the question is Have the two facts any real connexion? The scorching might have happened, though the leaves were dry. That looseness of reasoning which obscures so many subjects is nowhere more conspicuous than in gardening, where *post hoc* is as often confounded with *propter hoc* as it is in physic.

If the sun has the alleged power, there must be a reason for it, and accordingly what is called a reason is sometimes assigned. Water is said to collect in globules on the surface of a leaf, and so to concentrate the sun's rays like burning glasses. But there are some rather serious defects in this explanation. Water does not necessarily collect in globules; and if it did these globules could not act in a forcing house with more energy than the dew drops in the open air, which never burn plants. Moreover, the surface of a leaf is not in the focus of the imaginary flute burning glasses; and we need not say that the concentrated rays of the sun are only able to act when they are collected in a focus. Besides, when water falls on leaves, it assumes a plano convex figure, and then, the convexity being uppermost, no focus can be formed.

Another reason that has been offered for the supposed phenomenon is that of M. De Candolle, who says, "I should think, *if the fact is as represented*, that this burning arises from the water softening the tissue below it, becoming heated by the action of the sun and hindering evaporation." But long before the action of the sun could have heated a drop of water high enough to cause a burning, the water would be dispersed in the form of vapour; and there is no evidence to show that leaves are scorched by the stoppage of evaporation. If it were so, leaves should be burnt the most when they are plunged wholly into water, which is the reverse of the fact. If they *are* hurt between sun and water, it seems more likely to arise from the cold produced by sudden evaporation.

The most rational course will be to verify the statement in the first instance, and then, *if it be a fact*, to seek for its explanation. It may be said, Why doubt that which is so notorious? One of the best and most sensible gardeners in the country, in a letter now before us, says, "I can assure you that my Vines have suffered materially from being acted on by the sun while moist from the syringing of the previous evening, and from the vapour generated in the house while shut close during the night." And he refers the mischief to his houses having been glazed with close-lapped British sheet glass, giving it as his opinion, that in a house glazed with common glass, and open laps, it would not have occurred. This very statement seems to us conclusive as to the uncertainty of the cause of the burning. It may have arisen from the sun, or from want of ventilation, or from the vapour generated during the night, or, in short, from something else.

It is not difficult to meet these statements by counter assertions, also coming from excellent gardeners. Nobody grows much better Pines than Mr. Hamilton, who, however, "sprinkles their leaves with water two or three degrees warmer than the atmosphere of the house; and this mode of watering ought to be repeated *twice a day* in the summer-houses, *except in very cloudy weather!*" As the season advances, he waters the plants over the leaves whilst the sun is still shining on the glass, before its rays are much diminished. (*Treatise on the Pine-apple*, p. 65). Mr. Barnes also syringes, with water a little warm, occasionally on a fine day at any time. (*London*, p. 700.) And yet, what is more common than to hear of Pine plants being scorched by the sun shining on their wet leaves? Nor is the practice of wetting leaves at all times confined to certain Pine-growers. Mr. Roberts, whose Grapes have excited so much admiration at the London Shows, expressly declares—"Observe to keep up a very humid atmosphere, as under a clear sun the young foliage has a great drain upon it by evaporation, to a greater degree than when arrived at a more mature state. Syringe lightly, and close your houses early in the afternoon; say in March, two o'clock; April, half-past two; May, three; and so on, as the season and fruit advance to maturity." (*Culture of the Vine*, p. 47.)

We trust then that we have made out a case for inquiry. We would suggest the following mode of conducting it:—Take a Vine in very good health, in a well glazed light vinery. Place a few of its leaves in exactly the same circumstances as regards the roof. In a bright day, wet some of these leaves, do nothing to the others, and watch the result. We shall then know if the burning is owing to the sun shining on wet leaves, or to some other cause. The first warm sunny day will settle the question; and we trust that many of our Vine growing friends will tell us what they find to be the fact.

AN advertisement in another column will show the plan which will be adopted next Wednesday in regulating the MILITARY BANDS IN THE HORTICULTURAL SOCIETY'S GARDEN. In this country we know nothing of the surprising effects that may be produced in the open air by large numbers of military musicians. Next Wednesday, the assemblage of nearly 200 of the best in Europe will give some idea of what may be done in this way. No place near London of public resort offers so good an opportunity for trying the experiment as the Garden of the Horticultural Society.

THOSE who look at the progress of Gardening through the returns made in our columns of the proceedings of local and other HORTICULTURAL SOCIETIES, would come to the conclusion that it never was in a more flourishing condition than at present; and we think their judgment could not be gainsaid. Such returns are the best indications that we can have of the state of the public mind. But the more curious observer will remark something unsteady in these associations. Too often symptoms of feverish action are to be perceived, and not very uncommonly fatal cases are recorded. Although, upon the whole, the health of the body Horticultural is improved, yet it is evident that the care of the physician is occasionally wanted. A Society starts up to-day, flourishes to-morrow, languishes, and disappears. Why is this? To take an instance:—Nine years since there was no Horticultural Society in East Kent, when one was formed at Wingham, which still exists, although its funds are not so flourishing as they were. Another was shortly afterwards established at Dover, which flourished for four or five years, then languished, and finally expired. The following year a Society was started at Faversham, which ran about the same course, and is now defunct. Then succeeded one at Eltham, which after two or three years gave up the ghost. The city of Canterbury afterwards entered the field, and still continues to exist, but with three Shows in a year instead of four, as at first. The year before last another Society appeared at Ashford, which still continues as well as one in the Isle of Thanet. It appears, in fact, that the majority of provincial Horticultural Societies have but a short existence, few, unless established in populous neighbourhoods, lasting more than ten years.

It seems to be well worth ascertaining the cause of these fluctuations. As the spirit for gardening does not abate in the localities where the Societies disappear, it is therefore to be presumed that there is something vicious in the constitution and working of the Societies themselves, which sends them so early to the tomb. A correspondent, who is well acquainted with their management, suggests that the best course to pursue would be to obtain returns from all parts of the country as to the past and present state of such Societies, their numbers, expenses, distribution of prizes, &c., and more especially as to the causes of their decline or dissolution, where they have experienced such mishaps. We agree with him in thinking that some very useful as well as interesting information might be so elicited; and we would, therefore, ask all Secretaries or Managers to communicate with us on the subject. To render the returns useful, and capable of being compared, it will be necessary that they should be made upon printed forms, which we will undertake to supply *gratis* to all who will do us the favour to apply for them, by post. Every man's labour will be thus simplified on the one hand, and rendered uniform on the other. A comparison of the returns will certainly throw much light upon the history of horticultural *cremacausis*, as Professor Liebig would call it; and a good digest of the returns, which we promise to make if the requisite materials are furnished, will, we trust, enable those who may hereafter think of organising local Societies, on the one hand to avoid error, and on the other to adopt regulations which multiplied experience shows to be advantageous.

ENTOMOLOGY.

THE CURRANTS OR GRAPE OAK GALL, produced by *Cynips Quercus-pedunculi*.—I lately gave the history of the Woody-galls, and this is another of the excrescences formed upon the flowering stalks of the Oaks, and by far the prettiest with which I am acquainted; much resembling in form, size, and colour, bunches of the Champagne Currant. Oak trees are sometimes covered as thickly with these galls as Currant bushes are with berries: such was the case last May at Wingham, in Kent, and at the same time they were abundant at Enfield, yet I could not find them in Suffolk or Essex this season; but they once occurred in Coombwood, Surrey, in profusion, and about the middle of May, 1841. I gathered the specimen figured, which was particularly interesting, from its showing, I expect, the process of growth in these galls: the flower-buds had been inoculated by the female Cynips, probably the beginning of April or earlier, and some of the stalks were yet green, and the anthers not quite dead; towards the extremity of one were two kidney-shaped galls (fig. 1) also green and wrinkled, in which I discovered minute white maggots; on another were the fruit-formed galls (fig. 2), globular, smooth, shining, and of a dirty pale-green colour, marbled with purplish red; in these the stalks and anthers were completely withered, and on opening the galls I saw the white pupæ, with black heads, lying in small cavities.

From the 17th to the 20th May the little Cynipides kept issuing from the galls. Linnæus described them under the name of Cynips Quercus-pedunculi, and the males, which first make their appearance, are intensely black and shining; the antennæ are nearly as long as the body, slender, brown, and 15-jointed: the basal joints are of a dull straw-colour; the head is broad, the eyes large, and there are three prominent ocelli on the crown. The thorax is finely striated obliquely, with two longitudinal grooves down the disc, interrupted and forming four pits, scutellum linear, long, rounded and elevated; petiole very short, abdomen not longer than the thorax, and much narrower, compressed; wings greyish, pubescent, and iridescent, superior very ample, the cells of the usual form, the basal nervures deep pitchy, with a small trigonate areolet on the disc; legs long, slender, and dull straw-colour; pulvilli and claws pitchy. The female is similar, but the antennæ are shorter and 14-jointed; the abdomen is shorter and almost as large as the thorax, ovate-conical, compressed, with an oviduct beneath, (fig. 3;) the natural dimensions are exhibited by the crossed lines.

This species is less robust than many of the Cynipidæ are; the wings are large, the legs long, and altogether it seems to be well formed for flight. Mr. Main has made the following observation in the "Gardeners' Magazine" regarding this species, and it equally applies to the Woody-galls; he says, "There is a remarkable fact accompanying the deposition of the

eggs on the dangling stalk of the catkins. These male flowers are destined to wither and drop off as soon as their office of shedding the pollen is terminated; but if, before they have done so, they are seized and appropriated by the fly, they become permanent, and remain so until the maggot within the gall ceases to feed." From my own observations, as already recorded, it appears that many of the galls remain after the larva has become a pupa, and the same happens with the Woolly-galls, which are produced, as was lately shown, upon the male catkins of the Oaks; and the same difficulty presents itself in both instances relative to the deposition of the eggs by the summer broods, as we recently intimated, and which at present has not been satisfactorily accounted for.

These Cynipidæ are not free from the attacks of parasites, for I bred two very brilliant species from the currant-galls: one was apparently the Callimome flavipes of Walker, which is of a beautiful green with yellow legs, the ovipositor of the female being longer than the body; the other was the curious Platymesopus tibialis of Westwood. I am also now able to state that a pretty parasitic Chalcidideous insect has been produced from one of the Woolly-galls; several of both sexes were discovered in the box the 4th July, and they seem to be the Eulophus (Prosorus) similis of Walker.*

It will be remembered that the conglobated masses of twigs on the branches of the Birch, resembling swarms of bees and magpies' nests at a distance, also the mossy excrescences formed on the Briers, are the work of similar insects; which lately led to the suggestion, that if we knew the acids or poison which produce such remarkable objects, and the exact manner in which they are applied, it might be in the power of the philosopher to experimentalise with the same materials, and produce vegetable curiosities as interesting and ornamental as the Weeping Ash, &c. Let it not, however, be imagined that we prefer monstrosities to the simple beauties of nature, but every natural curiosity is worthy of investigation, if it be only in the search of truth; to unveil the mysteries of the creation appears to be one of the interminable subjects destined to exercise the ingenuity of man. —*Ruricola.*

PLAN OF A HOTHOUSE AT POLMAISE, STIRLINGSHIRE.

WE have been favoured by Mr. Murray with the following plan and description of a hothouse, lately erected by that gentleman at Polmaise, and heated without the intervention of flues or hot-water pipes, but merely by a circulation of air from the hot-air chamber of a stove, behind the wall of the hothouse. Mr. Murray writes that "The hot-air is made to circulate freely through all parts of the house, at any temperature the gardener chooses, and a constant fresh circulation of air is kept up, by merely taking advantage of the well-known principle that hot air is lighter than cold air, and that therefore a circulation can easily be kept up by making the openings or drains one at each corner of the hothouse, and placing a grating on them, and conducting the drains under the surface of the earth of the house, into the stove placed at the outside of the back wall of the house, and introducing the air when heated in the hot-air chamber of the house, by means of an opening as low as possible through the back wall, into the house; but as the air of the house would soon be all returned hot into the house, two drains, one at each end of the house, are made, conveying fresh air also into the stove, and uniting with the two from each corner before entering the stove, and thus keeping up a complete supply of fresh air to the stove to come out heated air, to supply air to the plants in constant succession, and thus forming a healthy climate at any temperature the gardener wishes, with a constant circulation, but without any chance of injuring the Vines at any stage of their growth from the admission of cold air.

"In order to steam the house, a very simple process is adopted, by placing a woollen cloth along the whole length of the house before the hot-air chamber's opening, and watering the woollen cloth, thus producing a mild and gentle steam without any risk of its being too hot, as often happens when a flue is overheated and then watered. A stage for flower-pots is placed in front of the woollen cloth, which is stretched along the back of the stage sloping towards the back wall, the stage being about three feet at the bottom and 9 inches at the top. Indeed, the watering the woollen cloth has been found so beneficial a way of applying steam that some of the neighbouring gardeners have applied it over their flues, and watered it in place of watering the hot flue as formerly. I have also adopted another method of steaming the house, so producing a damp atmosphere, which is preferable. A sewer for conducting water runs along the upper board of the above-mentioned stage, and into the sewer are inserted worsted threads, which hang down a few inches on the woollen cloth—say five or six inches—and convey water gradually and constantly by means of the capillary attraction, thus keeping up any degree of moisture in the house that may be required, which is particularly beneficial during the swelling of the fruit, and can be regulated completely by the number of threads employed, and their thickness; and the water in the sewer is supplied from a small barrel standing at one end of the stage, which can easily be filled when required; any degree of moisture may thus be given to the air of the house by increasing the quantity of heat, and proportioning the supply of water through the worsted threads, and being given gradually in place of a rush of steam when hot flues are watered, it more resembles the natural moisture of the air, and is more healthy for the plants, and the moist air may be continued for any number of hours at a time, without any trouble to the gardener, exactly as he wishes it, and to any degree.

"The house has only been built two seasons, but the strength and healthiness of the wood of the Vines and foliage exceeds any in the neighbouring hothouses, or indeed in most others, and the bunches of fruit are quite magnificent. Much less fuel is required through the year—nearly a half—and less attendance. There is no chance of a flue choking, as there are none, or of a pipe bursting, as there are none; of course the original cost is saved, and the repair necessary for both avoided; the fire is made up at night, and requires no attention until morning. The stove used is one of Haydon's patent stoves; and the idea occurred to me of using it for a hothouse, from having heated a large church with a stove by the same maker—merely a circulation of hot air, without flues or pipes. Several professional gardeners have visited the house lately, and all have approved of the great simplicity and cheapness of the plan; and from the success attending it, there is no doubt of its being generally adopted: and the more so, as it is well known that the fruit is always higher flavoured when a free circulation can be adopted of fresh air, at a proper temperature; indeed, the fine bunches of fruit which were obtained last season were particularly high flavoured. The size and strength of the Vines are more like the growth of five years than two, and the foliage is in proportion."—*W. Murray.*

REFERENCE TO PLAN.

A. The Grating, where the cold air is admitted to the stove from within the house.
B. The Drain, conducting the cold air to the stove, over which is the gangway.
C. A Valve for admitting fresh air from without, keeping a healthy atmosphere within.
D. The Stove.
E. The Warm Air Chamber, and *e* the outlet from the chamber.
F. The Woollen Cloth nailed underneath a stage for plants which extends to within 2 feet from each end of the Vinery, dispersing the warm air equally through the Vinery, and steaming it by applying water through the rose of a watering-pan upon the cloth.
G. Steps into the Vinery.

HYBRID FERNS.

A TRANSLATION of some remarks on Hybrid Ferns, by E. Regel, in the "Botanische Zeitung" of August 11, 1843, may be acceptable to some of your readers; to these I have appended copious extracts from a letter on the subject received lately from Mr. J. Henderson, who has paid so much attention to these beautiful plants and formed so valuable a collection of them. As the observations not only of a scientific but of a practical man, they will, I am sure, be thought worthy of comparison with those of Regel, and the more especially as Mr. Henderson had not seen Regel's observations. Regel writes as follows:—

"The production of hybrid Ferns was first announced in modern times by Bernhardi. At present it is only in the genus Gymnogramma that such intermediate Ferns have arisen during cultivation, as may be regarded as hybrids. The arguments which speak for such hybridisation must be but negative so long as nothing certain is known respecting the mode of impregnation; for the views of Hedwig, Stähelin, Œder, Schmidel, Kölreuter, Gärtner, and Mirbel, on the male organs, have been long regarded as unfounded. In like manner Bernhardi's and Presl's views are but hypothetical. The interesting discovery of Spermatozoa in Ferns lately made by my friend Dr. Nägeli, and which he will shortly publish, place the matter in a new light. Though the mode of impregnation may not have been discovered, still we have here a possibility of this process taking place. The negative ground, then, which speaks for hybridisation in the genus Gymnogramma acquires greater force. So long as a single species only is cultivated, each species of Gymnogramma remains constant under cultivation; but intermediate forms spring up from seeds when several sorts are grown. I have in my Herbarium, from the gardens of Berlin and Bonn, the following intermediate forms, which may be regarded as hybrids:—

"1. Between G. chrysophylla and peruviana, which is nearest to G. peruviana, as regards the mode of division and delicacy of structure; but the meal on the under side is of a somewhat duller yellow than in G. chrysophylla. This species is dispersed in gardens under the name of G. L'Herminieri. Whether it has arisen from culture or has been introduced, I cannot speak with certainty; it seems, however, to be one of those Ferns which are apparently hybrids. It was distributed from the Leipsic garden through Germany.

"2. I have a plant between G. chrysophylla and G. distans, which was raised at the Botanic Garden at Berlin. In outline it resembles G. distans, but the pinnæ are broader, and the colour of the meal is dull yellow. Probably this is the same plant which was raised from seed at Erfurt, and named by Bernhardi G. chrysophyllo-distans.

"3. A third Fern, intermediate between G. chrysophylla and dealbata, is known in Gardens by the name of G. Martensii.

"4. Two Ferns are known to me between G. chrysophylla and G. calomelana, both of which agree in outline with G. calomelana. In the one the meal is of a greenish yellow; this goes by the name of G. Massoni, and seems to have originated in England. The second originated in the Berlin Garden, and has the meal as intensely yellow as G. chrysophylla. This I call G. chrysophyllo-melana.

"5. I have a Fern perfectly intermediate, both as to division and the colour of the meal, between G. distans and G. calomelana. It is from the Berlin Garden, and I distinguish it by the name of G. distanti-dealbata.

"6. I have two Ferns intermediate between G. dealbata and G. calomelana; one of which is nearer to the former, the other to the latter. The first is from the Berlin and Bonn Gardens, and named by me G. dealbato-calomelana; the latter, from Berlin, I call G. calomelano-dealbata.

"7. Lastly, I have a Fern intermediate between G. calomelana and G. distans, from the Berlin Garden which I call G. distanti-calomelana. It is worthy of remark that these supposed hybrids are usually far more vigorous and larger than the parent plants.

"In conclusion, I beg leave to remark that if, in the absence of direct proof, these intermediate Ferns be regarded as mere varieties which have arisen from culture, we must for the sake of consistency suppose all the mealy species of Gymnogramma to have arisen from a single stock, which, if the extreme Ferns be considered, is very difficult to agree to."

Mr. Henderson writes to me on the subject as follows:—"I am afraid that I shall not be able to give you much useful information about Hybrid Ferns; it is a very perplexing subject, and all my inquiries in that direction have not enabled me to come to any decided opinion about the matter. Whether these plants are to be regarded as true hybrids, or the changes which they exhibit depend on peculiar circumstances affecting the individuals so changed, are questions which I think have not yet (as far as I know) been satisfactorily made out.

"I believe it is only in the genus Gymnogramma that those Ferns which are called hybrids have been produced from spores, appearing to partake of the characters of two different species. Among the hundreds of seedlings which are every year produced here, I have never in any instance observed a disposition to depart from the characters of the parent plant in any except those of Gymnogramma, and even these are confined to species the fronds of which have a farinaceous covering underneath. They differ chiefly in the colour of the farina, in the shape of the frond, and in having a much more robust habit than the species from which they are derived; they also produce few rather diminutive thecæ, with small imperfectly-formed spores, which I think are mostly if not always abortive. I have sent you specimens of the different sorts that have been raised here, and also a specimen of G. Martensii which was raised on the Continent, and which, in "Link's Filices," is said to be intermediate between G. calomelana and G. chrysophylla. I have also within these few days received G. L'Herminieri, said also to be intermediate between these species, but it is evidently much nearer to the latter than the former species.

"No. 1 is between G. chrysophylla and G. sulphurea, the frond resembling the latter species in outline, but on a larger scale, and the farina approaching to the rich golden colour of the former species. Whether this is really an accidental variety or a species from foreign spores I am unable to say. Two or three seedlings came up here six or seven years ago—one in a pot among foreign seedling Ferns, and another in a pot with an orchidaceous plant: since then about a dozen more have been raised, all so perfectly resembling one another, that I am inclined to think that it is rather a species than a variety. It is by far the most graceful of all the farinaceous Gymnogrammas.—"No. 2 resembles much G. tartarea, but differs in its very large size, its more upright habit, and in the yellow farina.—"No. 3 bears nearly the same relation to G. calomelana which No. 2. does to G. tartarea. It grows to a very large size, nearly twice that of G. calomelana. Neither this nor the preceding have any resemblance to the species with yellow farina.—"No. 4 seems intermediate between G. calomelana and one that is known in gardens under the name of G. ochracea, a species from Buenos Ayres: the farina is paler than in G. ochracea.—I have a number of seedlings, all

* Several of these genera are illustrated in Curtis's Brit. Ent., *vide* pl. 133 and 552; also the Guide, Genera, 618, 623, and 630.

the surface, than that it should be drained off by running over the uppermost or active soil. In clay districts, where the clay was found to be stiff and impervious to water, and was thrown into ridges of, say 6 feet, the active soil being thin, the water running over the surface damaged that part of the land near to the furrows, little was grown, and the plant was found to be stiff and spiry. When the drain was first cut in a stiff clay soil, there being no opening or crack in the land, the water at first was found to lie upon it, but soon afterwards the clay began to contract, it consequently occupied less space, and fissures were quickly perceptible in the body of the clay. At first these cracks were small, but it would be found from observation that they continued to extend all over the body of the soil betwixt the two drains; in a short time the whole of the land was found to be full of fissures, and in a completely spongy state. If the water remained in these fissures, the land would soon become as impervious as ever, but the cracks, which were found to be vertical as well as horizontal, suffered the water to pass along, and eventually it found its way into the opening of the drain by the fall which had been given, and the water ran from the field altogether, the active soil by this means being left completely dry. Practical experience had shown to him that the most advantageous depth for a drain was from 2 to 3 feet. He had also remarked that when the water fell into the soil, it expelled the air; that had been found to have a most beneficial effect on the soil, and the moment the water fell down, another portion of atmospheric air found its way into its place; thus the alternate action of water and the atmosphere materially benefited the land, because by this means a much greater depth of soil was obtained than if the land had remained in its stiff and impervious state. One great advantage of a 30-inch drain over one of 18 was, that if they went to plough immediately after rain had fallen, they avoided that puddling which was certain to be caused by the weight of a horse or cart where the shallow drain had been used. Another advantage in having the water sink into the surface was this: rain generally brought large quantities of ammonia; this was left in the soil by the under-draining, and must certainly be better than if the water ran merely along the surface. In cases, too, where large quantities of rain fell, it was important that every part of the land should bear equally the burthen of it; this could not be if it was suffered to run on to particular spots. Every one knew that the great object of farming was to produce the largest possible amount of grain, or crop of any kind, from any given area of surface; but that could not be accomplished unless every bit of the land produced an equal quantity with the rest. But there were other advantages of under-draining. By it the water did not pass too quickly into the drain; and if it was allowed to pass through the land slowly, in fact, almost by filtration, it had time to deposit everything it held in suspension in the soil, which was a great advantage. In all drains, properly executed, the water ran out of the land into the drain as pure as spring water. As a proof of this, in the low districts of Scotland, where there was a scarcity of water, the inhabitants found that they could obtain as much water as they required from these drains, and that it was quite palatable and fit for domestic purposes. He had become quite convinced of the great superiority under-draining had over any other system. He would only draw their attention to the present season to prove this. It had been, he believed, the driest since 1826, and he had been at some pains in making inquiries as to the state of the plant when the lands had been thoroughly drained, and he found one uniform result, that the plant had continued to grow, and was as vigorous and healthy as in years when there had been a large quantity of rain. That distinctly showed the advantage of the system. He would next advert to the distance which it was expedient to make between each drain, and after careful investigation and much experience, he found that in the stiffest clay soils the distance ought not to be more than 18 feet from drain to drain: that would be found to suit most soils. In some parts of Scotland he had known them to have as large a space as 40 feet between the drains, but in those cases the land had been generally found to be wet at the extreme points between the drains, and the consequence was, that it had been found necessary to make a drain between the two. In Scotland the most incalculable benefit had been derived from the drainage on the clay lands; in many cases they had begun to grow Mangold Wurzel, which it had been found impossible to cultivate previously; this of itself was of great importance to the farmers, and if this system of draining were adopted in England, large crops of Turnips might be grown where none could be before, and particularly of Mangold Wurzel, because, although the attempt had been made to grow them in Scotland, they had not suitable climate, and that they had in England. One thing he would urge them to bear in mind with reference to drainage, and that was the necessity there was for their having a good level and a good outfall; if the brooks into which the water was to be discharged from the drain were insufficient for that purpose, great evils might arise from it; he had seen an instance in which a fall at the rate of 6 inches in a mile threw out 300 tons of water an hour. He divided drains into three denominations—main drains, sub-drains, and minor drains; and it ought always to be observed, where these discharged into each other, that the sub-drain should be 6 inches deeper than the minor drain, and the main drain one foot lower than the sub-drain. Another great point also to be attended to was the constructing the drains in a regular manner. The parallel drains were decidedly the best, and a plan ought always to be kept in order to know the exact position of each drain: this was only to be accomplished by laying them down in a systematic manner. Some persons had agreed that the cross drains were the best; but as they must all terminate in a parallel drain, he thought it must follow that they should all be constructed on that principle. Mr. Smith then spoke of the manner of executing drains. In filling the drain with stones (which are better than tiles when they could be obtained for the same money), care should be taken that the stones were small and well selected. The depth of stones required he once thought was 12 inches, but from experience he now found that 8 or 9 inches were sufficient; consequently one-third of the quantity of stones originally used would now be saved. Care should be taken that the stones were well covered over with turf cut as thin as is used for thatching houses; and that the stones were completely covered from side to side; the turf should be covered over with 3 or 4 inches of soil taken from the bottom of the drain, because the more sterile its quality the better. He had executed 130 miles of draining within the last 30 years; he had since opened those drains in hundreds of places, all of which had been constructed according to the method he had described, and in not one single instance had he found any sediment between the stones. In many parts of England the expense was so great that it was found necessary to use tiles, and he did not object to them, particularly on clay-land; and they ought also to bear in mind that the tiles should never be put down without soles, because that enabled the cylinder to bear a much greater degree of pressure, and had been found in every respect much more efficacious. Mr. Smith next adverted at some length to the price, and more particularly to the construction of tiles; he declared himself to be of opinion that tiles were much the best without any holes in them, but expressed a hope that ere long a tile answering every purpose would be invented and made at a comparatively trifling cost. He had once advocated the system of putting stones over the tiles, he now found that there was nothing better than to trample clay which had been taken from the bottom of the drain firmly over them; that would be found not only sufficient to keep them in their places, but they would bear almost any weight. Mr. Smith then referred to the disposition of the surplus soil—but with this matter every agriculturist will be quite familiar—and proceeded to remark on subsoil-ploughing. The object of this was, he said, to move the sterile soil under the active soil, to free it from the water, and in time to bring it into such a state that it might be an adjunct, and, in fact, form a part of the active soil already possessed. He tried various methods to accomplish this object, and at length he got a plough made of 3 cwt., and with it ploughed 200 acres of land of his own; all his neighbours had used it; it had been in use upwards of 20 years, and had never been sent to the blacksmith's consequent on any serious derangement of the machinery, and it had turned up stones of 2 cwt. Subsoil-ploughing, as they were all aware, was merely to stir up the under soil at first, and not to throw it up; no farmer could succeed except he had a deep soil; he began farming with a soil varying from 2¼ to 4 inches in depth, but after under-draining and subsoil-ploughing, he had had for the last ten years, 16 inches of mould; this was on what had previously been one of the most sterile farms that was to be met with. The subsoiling might be commenced carefully a year after draining; the first crop after draining should be Oats, and then they might begin to subsoil-plough, but it would be necessary that the work should be done cautiously. He had been asked whether subsoil-ploughing might take place before the land was drained; his reply was, that it would be very dangerous, because if an opening were made before there had been a regular course of draining, it only made a pool to hold more water. But of all things he cautioned them that the utmost care should be used in subsoil-ploughing for the first three or four years after draining. Several questions were put to Mr. Smith by Mr. Baker and other gentlemen. He said, in reply to one question, "Straw or stubble will do to put on the top of tiles on clay soils;" in reply to another, "It is improper to place light soil on the top of them;" and to a third, "It is possible, and in fact quite practicable, to drain with peat;" to a fourth, "I recommend land to be laid flat after thorough-draining;" and to a fifth, "I would not lay the land level until after the subsoiling had taken place.—*Abridged from Worcester Chronicle.*

Miscellaneous.

Thorough Draining.—Mr. Aiton says—"In all clay soil and dense land the water does not filter beyond the depth of the plough furrow, unless the subsoil has been opened by trenching or subsoil-ploughing." Also, "In such land, if a pool be dug within 18 inches of the drain, and 30 inches in depth, when filled with water not a drop of it will (if the subsoil has not been rent in forming the pool) filter from the pond to the drain, but stand there until it is exhaled in vapour, by the sun, and by dry winds." The whole of these opinions have proved to be erroneous. I have found that the water does filter through the unbroken subsoil of dense clay, and that it does filter out of such pools as Mr. Aiton speaks of, to the drains. My proofs:—During the past season I opened 93 pools, and made observations for the purpose of tracing the rise and fall of the waters therein during the various changes from wet to drought, and the contrary in unbroken and broken subsoil. I have found that, in heavy blue adhesive clay, in which not the slightest porosity seemingly existed, the water was carried or filtered through the subsoil to the drains 24 feet on each side; and in less tenacious subsoils as far as 30 feet; and when the subsoil was broken, the distance from which the water was drawn was increased; but the great observable difference of effect lay in the shorter time in which it filtered to the drains. I formed the pools at right angles to the drains, at intervals of 6 feet asunder. I submit short comparative extracts from my registry:—

Experiment, No. I.—Soil, thin blue clay on a heavy blue adhesive subsoil. The depth of the surface of the water in the pools is marked in inches.

Line of Drain. Line of pools marked *							Weather, &c.
	*	*	*	*	*	*	
	15	10¼	4¾	3¾	3	2¼	3¼ 26th October—10 o'clock, A.M. On the 24th, heavy showers; the 25th dry, with bright sun. Night wet.
	2	1¾	full	full.	2	1¼	3 28th Oct.—10. A.M. Previous day and night and this morning characterised by heavy and almost continuous rain.
	13⅝	8½	3½	2⅞	3½	3⅜	3⅜ 30th Oct.—Half past 8. A.M. Part of 28th very heavy rain. Remainder of period to this date cold, frosty, and dry.
	13	8¼	4⅜	3⅜	1	1¼	⅛ Rise during the wet period.
	11⅞	6⅜	6½	2⅝	1⅛	2¼	⅜ Fall during the dry period.

Experiment No. II.—*Soil*—Strong heavy clay, incumbent on a close, compact, reddish subsoil, intermixed with blue clay, and less retentive than No. I. The pools when made were at a distance from any of the drains then formed. The drain with which these observations are connected was opened 21st Oct. 1844. Thus the depth of water, and of course the effect, is observed by the comparison below.

Line of Drain. Line of Pools marked *							Date of Registry, Weather, &c.
	*	*	*	*	*	*	
	8	5	9	7	6	6	19th Oct. 7 A.M.—Warm sun, but little drought.
	5½	4	7	5	4	4	21st Oct. 7 A.M.—Heavy rain for 3 or 4 hours, remainder of time mild but little drought.
	11	3⅞	6⅜	6⅜	4½	4½	22nd Oct. 7 A.M.—Commenced to rain lightly previous evening at 8 P.M.; heavy this morning, and ceased at 8 A.M.
	11⅓	5⅝	8	7⅓	4	3⅝	23rd Oct. ½ past 7 A.M.—Heavy showers during the previous 24 hours.
	12½	5⅛	7	6½	4⅛	4⅓	26th Oct. 9 A.M.—Heavy rain on the 24th during half the day; 25th dry, with bright sun—night wet.
	13⅝	7⅜	10¼	8⅞	5⅛	5⅓	27th Oct. ½ past 7 A.M.—Previous day and night dry and frosty.
	6½	1	4⅜	2⅓	2	1⅛	28th Oct. ½ past 10 A.M.—Previous day and night heavy and continuous rain.
	11½	10	12⅜	10½	8	7⅜	31st Oct. 8 A.M.—The 28th very wet; remainder of period drying and a little frosty.
Comparison of draining effects, in unbroken Subsoil.							
	6	6	5⅜	5½	4	3⅜	Fall from 21st (the day on which the drain was opened) to the 31st October.
	0½	0	1	1	0	2	Fall from 8th to 21st October, previous to the drain being opened.

The above shows distinctly that the water was drawn off to a distance of 24 feet from the drains, and the fallacy of Mr. Aiton's statement, that "the water does not filter through the unbroken subsoil;" also, that "it does '*not*' lodge in the pools until exhaled in vapour by the sun," &c. It cannot be alleged that the subsoil was rent in digging the pools. The subsoil was unbroken, and yet the water passed off quickly; and even if the subsoil had been partially rent, the distances from which the water was drawn, on the drain being opened, proves distinctly that it percolates through the unbroken subsoil. If the operation of opening a pool 12 or 15 inches square had rent the subsoil, it could only have been a few inches around it; but this idea is absurd, as the tendency of such operation is to consolidate and render the pools more retentive of water. The following comparison shows more clearly the effect made at a distance from which the water is drawn off. One part of the ground unbroken, and the other trenched 18 inches deep:—

Line of Drains. * Line of Pools marked *							Date of Registry, &c.	
	*	*	*	*	*	*		
	14	12	12	14½	13	13	Trenched	28th Nov, 8 A.M. Weather mild, but very little drought.
	9	6	9	7	4	4	Untrenched	
	15	11½	12	14	14	14	Trenched	15th Dec. 8 A.M. Previous three or four days very drying.
	15	11	13½	12	9	8½	Untrenched	
	10	8½	9	9½	10½	10½	Trenched	21st Dec. 8 A.M. Rain during the previous night.
	15	9	9½	9	6¼	6¼	Untrenched	

There are some apparent discrepancies in this comparative registry, but arising principally from some of the

* These figures express the distance in inches of the surface of the water in the pools from the surface of the ground; the depth, in fact, which the water had sunk in the pools.

pools lying in hollows or furrows, on which Mr. Aiton relies, as on a broken reed, for drawing off the surface water. From these it is evident that the water percolated from the fourth pool, or 24 feet, after which, the difference in rise and fall of the waters leaves not the shadow of a doubt as to the result, although the contrary is so confidently asserted by Mr. Aiton. A comparison of the trenched and the untrenched proves the greater distance from which the water is drawn in the former; and I know that it would be carried from a much greater distance if the land was subsoiled as it was drawn off from the extreme of the part trenched deep.—*John Mc Arthur, in the Ayrshire Agriculturist.*

African Guano.—A friend has favoured us with the following analysis, by Mr. R. Phillips, of a sample of African Guano submitted to that excellent chemist for examination:—

Ammoniacal Salts, containing 7⅕ of ammonia and organic animal matter	46.0
Phosphate of Lime, &c.	19.8
Fixed Alkaline Salts	4.2
Sand	4.0
Water	26.0
	100.0

Artificial Manures.—Experiments with Artificial Manures, tried by T. C. Eyton, Esq., at Donnerville, near Wellington; Seed, Swedish Turnips, obtained from Skirving's, Liverpool. Sown on the 17th of May, 1845; pulled and weighed on the 22d of November.

No.	Description of Manure.	Cost per Acre. £	s.	d.	Weight of Crop per acre. ton.	cwt.	Measure per acre. bush.	Cost of Manure per bushel of crop. d.
1	165 lbs. of Mur. Ammon. 220 lbs. of Gypsum	1	10	11	7	1½	154	2½
2	330 lbs. of Guano	1	13	6	15	1	308	1¼
3	165 lbs. of Mur. Ammon.	1	6	6	8	16	192½	1½

6	165 lbs. of Mur. Ammon. 11 bush. Wood-ashes.	1	17	6	14	19½	385	1¼
7	1322 gals. Liq. Manure, viz., Urine & Soapsuds	—			11	9½	269	—
8	66 lbs. of Bones 8¼ qts., or 33 lbs., of Sulphuric Acid 550 gallons of Water	0	8	5½	14	6	346½	¼
9	484 lbs. of Bone dust	1	1	7½	14	19½	309	¾

REMARKS.—In the above calculation fractional parts are not included: the following is an analysis of the subsoil. I was told by a former tenant of the field that it would not grow Turnips; it was, however, drained shortly before the Turnips were sown.

One hundred parts of the soil contain—

Water	11 parts.
Silica or Sand	70 ,,
Alumina or Clay	15 ,,
Red Oxide of Iron	1.5 ,,
Carbonate of Lime	1.5 ,,
Loss	1 ,,
A trace of Sulphate of Lime in weight not appreciable.	
	100

The proportion of silica is that yielded by the soil after the largest stones or pebbles had been removed from it. The Turnips all came up together, nor was there any perceptible difference in their appearance on the 27th of May: on the 14th of June No. 2 appeared to take the lead, 1, 7, 8, looking the worst, and being more backward than the others; on June the 20th they were horse and hand-hoed, Nos. 9, 10, 8, 4, 5, were equal in appearance to No. 2; on July 21st, No. 5 looked best, No. 1 the worst of all.—*From a Lecture by T. C. Eyton, Esq., to the Wellington Farmers' Club.*

Water Meadows, Hampshire.—These meadows are copiously irrigated by the bright chalk waters of the Itchen, a river whose waters are, perhaps, the most copious, considering the shortness of its course, of all the southern English rivers. The farmer who views the mass of crystal water, pouring under Winchester bridge, will hardly feel inclined to suspect that all this flood is the produce of a few springs which arise within seven miles of the city. When the farmer also notices the fertility diffused by the use of these bright waters—waters which contain such very limited proportions of either earthy, saline, or organic impurities, he will feel assured that it is an error to conclude that it is only very impure waters that are valuable for the use of the irrigator. It is, in fact, a mistake which most persons make, to suppose that even these bright and transparent waters are perfectly pure, and that they do not contain any substances which are the food of plants—for both these popular opinions have been proved to be erroneous. Thus, the waters of the Itchen contain, in 10,000 parts, 2½ parts of solid matter, viz.—

Organic matter	0.20 parts.
Carbonate of lime (chalk)	1.89 ,,
Sulphate of lime (gypsum)	0.72 ,,
Muriate of soda (common salt)	1.01 ,,

Now, that these saline substances are absorbed by plants, from these kinds of irrigation waters, has been shown by Dr. Madden ("Trans. High. Soc." vol. viii. p. 687), who found, in a gallon of the water of some springs issuing from the foot of the Pentland Hills, of

Carbonate of lime (chalk)	4 grains.
Chloride of sodium (common salt)	10 ,,

But after this water had been passed over some meadows, it was found to contain these salts in diminished proportions. The same quantity of water then containing, of

Chalk only	2 grains.
Common salt	5 ,,

Such facts would appear to confirm the conclusions of some of the ablest cultivators, that the chief advantages of irrigation are attributable to the foreign substances with which the water is charged; although, as we have elsewhere observed, almost every farmer has a mode of accounting for the highly fertilising effects of irrigation—one thinks it cools the land, another that it keeps the Grass warm in winter. And this was Sir H. Davy's opinion. He thought that a winter-flooding protected the Grass from the injurious effects of frost. In these conclusions with regard to the theory of irrigation, we have found many excellent practical farmers concur. Thus, Mr. Simonds, of St. Cross, near Winchester, considers that the great benefit of winter flooding for meadows is derived, in the first place, from the deposits made by the muddy waters on the Grass; and, secondly, from the winter covering with water preventing the ill effects to the Grass of sudden transitions in the temperature of the atmosphere. This gentleman is perfectly aware of the value of the addition of the city drainage of Winchester to the fertilising qualities of the Itchen river water, and of its superiority for irrigation after it has flowed past the city, having watered meadows both above and below the town; and he finds that if the water has been once used for irrigation, that then its fertilising properties are so materially reduced that it is of little value for again passing over the meadows; and so convinced is he, by experience, of this fact, that, having in this way long enjoyed the exclusive and valuable use of a branch of the waters of the Itchen for some Grass land, a neighbour higher up the stream followed his example, constructing some water meadows, and using the water before it arrived at those of our informant, who, in consequence, found the water so deteriorated in quality (though not sensibly diminished in quantity) that he once thought of disputing the right with his more upland neighbour. The experience of other irrigators tends to the same conclusion. In the best managed water meadows of Hampshire the farmer does not procure annually more than three crops of Grass; yet in situations where a richer water is employed, as near Edinburgh, four or five are readily obtained.—*From Mr. Johnson's Register of Implements, Southampton Show.*

Notices to Correspondents.

RURAL CHEMISTRY. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s*. 6*d*.

BOOKS.—*D. L. B.*—Lectures on "Agricultural Chemistry and Geology," by Professor Johnston. With regard to your tanks, its contents, if the ammonia in them be fixed, should be used on land a fortnight before sowing Corn in spring; or you may put it on your young crops of Wheat or Grass in April.——*Cestriensis W.*—Thank you for your communication—we may, perhaps, hereafter make use of it, and shall be very glad to receive the results of your experiments on Potatoes.

BURNING CLAY.—*B.S.*—See a tract on this subject published in 1850—"Practical Hints on Burning Clay," by C. Poppy.

DISEASE IN PIGS.—*Holby Bank.*—This disease is of the nature of palsy, and produced most probably by cold. Give 1 dr. of gentian, ½ dr. of ginger, ½ dr. of spirit of nitrous ether, in a little gruel, and repeat, if necessary, the following day. *W. O. S.*

MANURE.—*H. A. S.*—Sulphuric or muriatic acid is the most certain fixer of ammonia. The price should determine your preference of either. With regard to its use, see two or three articles on "Fixation of Ammonia," in Nos. 26 and 27 of this Paper, and sprinkle the *diluted* acid over the manure in the yard.

NEWSPAPER.—*A.B.C.*—The subscription is 6*s*. 6*d*. per quarter, *if paid in advance.* If you cannot get the Paper supplied you at this rate our own agent will send it you. Thanks for your paper; you are quite right.

PROF. JOHNSTON.—*S.* We shall answer next week.

RABBITS.—*J. P.*—The tenant of lands, or any person by his direction or command, may take or destroy rabbits on such lands without taking out a Game Certificate, and that either with a gun or in any other manner. See Exceptions to the Duties in Schedule L. of 52 Geo. III. c. 93. *W.*

SMOTHER-BURNING OF PEAT.—*W. Bartlett.*—Will Mr. Parkes' Paper, in a former Number, on Peat-Charcoal answer your question?

STEEPING SEEDS.—*A Subscriber.*—Lime will dry your seed, but it will tend to decompose the substance in which it has been soaked. Charcoal dust might dry it, but probably if you steep on a large scale, practical difficulties might exist in the way of its use. What we soaked was *hoed in* wet, half an-hour after being taken out of the water. You must not soak except in a very weak solution so long as 60 hours—at least our experience proves the danger of the practice. We should be glad to know the results of your experience in steeping seeds.

TURNIPS.—*W.* hopes that the Earl of Essex will kindly hereafter report the result of his lordship's interesting experiment, so as to ascertain the effect on the ripened crop of the manures applied.

***As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, July 22.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	8	to 4*s*	0	Best Downs & Half-breds	3*s* 10	to 4*s* 2
Best Short Horns	3	2		3 6	Best Long-wools	3 6	3 10
Second quality Beasts	2	10		3 2	Ewes and second quality	3 2	3 6
Calves	3	8		4 2	Lambs	4 4	5 0
Pigs	3	0		3 8			

Beasts, 2580; Sheep and Lambs, 22,250; Calves, 198; Pigs, 250.

We have a very fair supply of Beasts to-day, and in tolerably good condition. Trade is not very brisk, especially for large coarse Beasts and second qualities, but the best Scots, &c. maintain their price, in some few instances 4*s* 2*d* per 8 lbs. has been obtained, and some of the very best Short horns have made 4*s* 4*d*. The supply of Sheep is again large, but we are not over stocked with the best qualities, and there is still a large demand for keeping Sheep; thus, although the numbers have somewhat affected the trade, and made it a little worse than on Friday, it is not sufficiently so to make any alteration in our quotations. Good Lamb maintains its price, and is rather more in demand, but middling qualities are very difficult to dispose of. Veal and Pork are rather lower.

FRIDAY, July 26.

We have a large supply of Beasts, and very little trade; the weather having been so excessively hot during the week has hindered the Butchers from killing. A large number must be turned out; what are sold suffer a reduction of fully 2d per 8 lbs from Monday. Our supply of Sheep is not very large, but quite adequate to the demand: the weather has also caused lower prices to be taken, especially for large Sheep: the most selling Downs make about 4*s*. and Longwools 3*s* 8*d*. We have a great deal of plain Lamb; the best quality is worth about 5*s*. There is a very large supply of Calves, and 4*s* per 8 lbs is quite the top price. Pork is about the same as on Monday.

Beasts, 773; Sheep and Lambs, 12,270; Calves, 490; Pigs, 283.

41, West Smithfield.

HOPS, FRIDAY, July 26.

The parts of the plantations which have been severely attacked with vermin are completely gone into blight, and the opinions are not very favourable respecting the good district. There is no material alteration to notice in the Market, and the duty is laid at 145,000*l*.

PATTENDEN & SMITH, Hop-Factors.

WOOL.—BRITISH, FRIDAY, July 26.

	per lb.				per lb.		
Long-wooled Wethers	11*d*	to	1*s* 0½	Southdown Hoggitts	1*s* 0½	to	1*s* 2½
Do. Hoggitts	1*s* 1		1 8	Kent Fleeces	1 1		1 2
Southdown Fleeces	11½		1 0½				

JAMES FARRAR, Wool Broker.

COVENT GARDEN, JULY 25.—In consequence of the late fine weather the market continues to be well supplied with vegetables of tolerably good quality. Fruit of all kinds in season is abundant. Pine Apples are good; they consist principally of Queens, with a few Montserrats, Enville, and Providences. A considerable quantity of the imported varieties mentioned last week are still in the market; they are somewhat reduced in price. Of Hothouse Grapes there is a fair supply; Peaches and Nectarines are very good. Apricots are for the most part small in size. Plums are pretty good, and are becoming more plentiful; they consist chiefly of Orleans, with a few Green Gages. Cherries are sufficient for the demand, but Strawberries are less abundant. Raspberries, Currants, and Gooseberries are offered in large quantities. Kitchen Apples are to be procured, but they are still small. Some good specimens of frame Cucumbers are in the market, which may be obtained at a low price. Peas continue to be brought in considerable quantities, and French Beans are sufficient for the demand. Carrots are good, but Turnips are rather inferior both in size and quality. Good Cauliflowers may be met with, but they are becoming scarcer. Cabbages are good and plentiful. Artichokes and Vegetable Marrows are not scarce. Salading and Herbs of every description are plentiful. Cut Flowers comprise Swainsona galegifolia, Lilium eximium, Bignonia venusta, Alstrœmeria pelegrina, Ceanothus azureus, Heaths, Gladioli, Pelargoniums and Gardenias, with Roses, Carnations, Picotees, Verbenas and Fuchsias, in great abundance.

FRUITS.

Pine Apple, per lb., 4*s* to 6*s*	Strawberries, per gallon, 1*s* 6*d* to 2*s*
Hothouse Grapes, per lb., 2*s* to 6*s*	Gooseberries, per half-sieve, 1*s* 6*d* to 4*s*
Melons, each, 2*s* to 5*s*	Walnuts, pickl., per bush, 4*s* 6*d* to 5*s* 6*d*
Peaches, per dozen, 6*s* to 12*s*	Oranges, per dozen, 1*s* to 2*s*
Apples, Dessert, per bush., 3*s* to 6*s*	— per 100, 5*s* to 12*s*
— Kitchen, 2*s* 6*d* to 4*s*	— bitter, per 100, 8*s* to 14*s*
Pears, Dess., per half-sv., 2*s* to 5*s*	Lemons, per dozen, 1*s* to 2*s*
Cherries, Wall, per lb., 1*s* to 2*s*	— per 100, 8*s* to 14*s*
— Standards, per doz., 1*s* to 3*s*	Almonds, per peck, 6*s*
— Morello, per hf.-sv., 4*s* to 6*s*	Sweet Almonds, per lb., 2*s* 6*d*
Currants, per half-sieve, 2*s* 6*d* to 4*s*	Nuts, Barcelona, 22*s*
— White, per sieve, 3*s* to 4*s* 6*d*	— Cob, 14*s*
— Black, per sv., 4*s* 6*d* to 5*s* 6*d*	

VEGETABLES.

Cabbages, per dozen, 8*d* to 1*s*	Leeks, per bun., 3*d* to 4*d*
Cauliflowers, per doz., 3*s* to 9*s*	Chilis, per doz., 1*s*
Sorrel, per hf.-sieve, 6*d* to 9*d*	Garlic, per lb., 6*d* to 8*d*
Artichokes, per doz., 1*s* to 3*s*	Onions, per bunch, 2*d* to 7*d*
French Beans, per hf.-sv., 1*s* 6*d* to 3*s*	— large, per bushel, 1*s* to 3*s*
Potatoes, New, per cwt., 4*s* 6*d* to 6*s* 6*d*	Shallots, per lb., 4*d* to 6*d*
New Turnips, per bunch, 3*d* to 10*d*	— Green, per bunch, 3*d* to 4*d*
Peas, per bushel sieve, 2*s* 3*d* to 4*s*	Lettuce, per score, 6*d* to 1*s* 6*d*
Red Beet, per doz., 1*s* to 2*s*	Celery, per bunch, 1*s* to 1*s* 6*d*
New Carrots, 4*d* to 1*s*	Mushrooms, per pottle, 2*s* to 3*s* 6*d*
Basil, per bunch, 4*d* to 6*d*	Small Salads, per punnet, 2*d* to 3*d*
Horse Radish, per bundle, 2*s* to 3*s*	Watercress, p. 12 sm. bun 3*d* to 6*d*
Savory, per bunch, 3*d* to 6*d*	Parsley, per hf.-sieve, 1*s* to 1*s* 6*d*
Cucumbers, Frame, each, 5*d* to 9*d*	Tarragon, Green, per bunch, 3*d* to 4*d*
— Ridge, each, 3*d* to 5*d*	Green Mint, per bunch, 2*d* to 4*d*
Vegetable Marrow, per doz., 9*d* to 2*s*	Marjoram, per bunch 4*d* to 6*d*
Spinach, per sieve, 2*s* to 3*s*	Chervil, per punnet, 2*d* to 3*d*

MARK-LANE, MONDAY, July 22.

THE supply of English Wheat from Kent, Essex, and Suffolk this morning was moderate; notwithstanding which, sales could not be proceeded with, excepting at a decline of 2*s*. to 3*s*. per qr., at which reduction the stands were not cleared. For Foreign, the greatest difficulty was experienced in finding purchasers, even of retail quantities, at a decline of 1*s*. to 2*s*. per qr. on middling Red, and out of conditioned parcels a greater sacrifice would have been submitted to, to induce buyers to take a quantity, but they refrained entirely from touching these descriptions.—In Barley there is scarcely anything doing, and the tendency of prices is downwards.—The value of Beans and White Peas is unaltered, but Grey are 1*s*. cheaper.—Oats are a slow sale, and barely maintain their late quotations.

FRIDAY, July 26.

The fine, hot, and favourable weather we have had for forwarding the harvest since Monday has caused a very dull trade for all descriptions of Corn: Millers refrain from purchasing, and we are consequently unable to quote the decline in Wheat, but holders would probably have accepted a further reduction.—Barley, Beans, and Peas are nominally unaltered in value.—The Oat-trade is very heavy, and barely supports our quotations.

closely resembling G. calomelana, but with farina more or less of a yellow colour. G. calomelana is, in fact, a very variable species in respect to the colour of its farina. I have hardly a plant the farina of which is free from a tinge of yellow."—*M. J. Berkeley.*

FAMILIAR BOTANY.

Morphology.—No. XVI.

By soft degrees a mighty change ensues.

Erratum.—P. 404, line 49 from the bottom, *for* "Each of these carpels is like that of the Whitethorn," *read* "Each of these carpels is like that of the Cherry."

The fruit of a plant is either merely its ripened carpel, or the ripened carpel together with the parts of the flower that surround it. A Peach is the first, an Apple is the second. This being so, and a carpel, together with the parts of the flower that surround it, having been demonstrated in former articles to be, beyond all possibility of doubt, altered leaves, it follows that the fruit of a plant is also a leaf or leaves. There is no getting away from the conclusion that is thus arrived at.

The changes that the carpel undergoes in the course of its change into a fruit are so numerous, that it would be tedious to discuss them in detail. The alterations that result in the formation of a Peach may be taken as an illustration of the process in other cases.

When the flower of a Peach drops off, the carpel loses its style and stigma, which are no longer wanted, and the ovary alone remains to swell and change. It is to be recollected that that ovary consists of the two sides of a leaf turned inwards, and united at the edges; consequently, one side of it answers to one half of a leaf, and the other side to the opposite half. Now, it is not uncommon to find one half of a leaf green and the other white, or to have the two halves different in some other respect. In the Peach the carpellary leaf is, in like manner, occasionally found to be smooth on one half, and downy on the other; and then, when such a carpel becomes a ripe fruit, one half is a Nectarine, and the other a Peach. This is not of uncommon occurrence, and is clearly intelligible upon morphological reasoning, and upon no other.

Vegetable anatomists also know that the leaf of a Peach-tree, although as thin as a piece of paper, consists in reality of two layers, of which the uppermost is much more compact than the other, in consequence of its component parts being differently arranged. Now, the inside of a Peach is the upper side of the leaf out of which it is fashioned, and therefore may very well be the hardest, as, in fact, we find it to be: for the stone of the Peach is its inside.

When the carpel of a Peach swells, its sides thicken, and soon acquire the texture of brittle leather; by degrees the apparent uniformity of the materials out of which the sides of the Peach are organised cease to present a uniform appearance. The inside (or upper side of the carpellary leaf), becomes paler and firmer; and thus the stone originates. Those who put green Peaches into pickles know this, for such Peaches are unfit for the purpose as soon as a pin refuses to pass easily through them. Gardeners know it still better; for the time when the hardening of the inside of the Peach takes effect is the critical period in the life of the young fruit. At that time the colour of all the parts is the same, or nearly so; it is only by its greater hardness that the future stone is to be known. But by degrees two opposite changes take place in the two layers of the Peach; the outer becomes more and more soft, acquires great succulence, changes colour, and ends in the flesh; the inner becomes more and more hard, acquires considerable dryness, and ends in the stone. In some Peaches the two layers, one flesh and the other stone, freely separate; in others they as firmly adhere—as we all know.

It is thus that a Peach is made out of a leaf in the form of a carpel; and a similar investigation so completely explains the formation of all other fruits, that I shall pursue the matter no further. There is, however, a class of facts connected with certain kinds of fruits, so intimately connected with this subject, and so conclusively establishing the exactness of the views of morphologists, that they may not be passed by in silence.

Every year we remark occasional instances of an Apple or a Pear lengthening out, and acquiring the appearance of a Pear within a Pear. Mr. Peter Mackenzie sent us in 1842 a very curious instance of the sort in a Crassane Pear; and in the same year Mr. Henderson, of Brompton, forwarded a Chaumontelle equally instructive, a figure of which is here introduced.

It had lost entirely its usual form, instead of which it appeared to be constructed with scales arranged one over the other, in the manner of a Pine cone. Nothing can be clearer than that in this case the leaves of the calyx and corolla had increased somewhat in number, the centre round which they were first arranged having lengthened out a little. The effect of the lengthening was to separate the leaves a little, and to raise them somewhat one above another; so that, when the fleshening process took place, their ends projecting one beyond the other would necessarily assume the appearance in the woodcut. If a leaf-bud lengthens a little, this is what happens; and there is no conceivable reason why a flower-bud, which is the same thing in another form, should not also lengthen in the presence of disturbing causes.

What those causes are I shall leave the Editor of the *Gardeners' Chronicle* to explain when he shows, as he one day will endeavour to do, how important a connection there is between Morphology and Gardening.—*R. E.*

NOTES ON AMERICAN PLANTS.

Having, during the spring of 1843, joined a party of gentlemen at St. Louis, state of Missouri, who were bound to the Rocky Mountains on a hunting excursion, and as Botanical pursuits were my sole object, I have thought it might gratify some of the readers of the *Chronicle* to learn a few particulars respecting the localities of the various genera that came under my observation; at the same time I must remark that this is very deficient as a list of the flora in the regions which we traversed. Our movements were too rapid to afford a fair opportunity for exploring many of the most favourable localities, and although I daily travelled at least one-third more than the rest of the party, still I was not able to examine the country as I could have wished.

We left the city of St. Louis on the 2d of May, and proceeded up the Missouri by a steam-boat, a distance of 360 miles. The banks of this noble river were beautifully ornamented by the Cercis Canadensis, which displayed its purple flowers in the greatest profusion. Among the herbaceous plants, I observed several species of Viola, the Podophyllum peltatum, two species of Habenaria, some Oxalis, Corydalis, and Anemone Pennsylvanica; but the spring having been unusually backward, Flora had not then displayed many of her treasures. We reached Westport on the 8th of May. This is the Ultima Thule of civilisation; and, as henceforward we had to travel by land, we had to encamp until the 21st in order to make the necessary arrangements for prosecuting our journey. This delay afforded me a good opportunity of examining the country around. The following embrace such plants as came under my observation, viz., Claytonia virginica, Batschia canescens, B. longiflora, B. Gonelina, Corydalis cucullaria, Baptisia leucophæa, B. leucantha, B. cœrulea, Krigia dandelion, Erythronium albidum, Sisyrinchium mucronatum, with its varieties; Pastinaca fœniculacea, Cypripedium albidum or candidum, C. parviflorum, C. pubescens, Oxalis violacea, Hypoxis erecta, Astragalus caryocarpus, Cercis Canadensis, Viola cucullata, V. pedata, V. delphiniifolia, and Verbena Aubletia.

During the first week of our journey, which comprised only a distance of about 100 miles, being from Westport to the Kanzas River, the chief plants were Phalangium esculentum, Ellisia Nyctalea, Psoralea esculenta. The Baptisias leucophæa and leucantha, with Batschia canescens and B. longiflora, were most profusely spread over the rich undulating prairies we traversed, and gave the whole scenery a gay—nay, even a brilliant appearance. The Eryngium aquaticum was the plant that most prevailed, but it was not then in flower. The soil here was very rich, and the country was particularly well wooded along the margin of the various streams which intersected the prairies, comprising the Ash, several species of Elm, Hickory, various Oaks, the American Pappaw, Chesnut, Beech, Birch, and Poplar. From the Kanzas River to the River Platte, which we reached on the 14th of June, the Phlox aristata, Astragalus adsurgens, Pentstemon grandiflorus, and another species, with the Sida coccinea and Gaura coccinea, displayed their rich blossoms in the greatest profusion. The latter plant has a beautiful rosy shade in the morning, scarlet towards noon, and nearly a white in the evening, when it emits a most agreeable odour. This plant and the Gaura coccinea continued to produce their rich blossoms until we reached the Sweet-water of the Platte, a distance of nearly 800 miles. While travelling over this region, I found a beautiful crimson Malva, or Nuttallia. The following embrace the principal plants which came under my notice during this part of our journey:—Lathyrus ornatus, Oxytropis Lamberti, Liatris pycnostachya, L. punctata, Salvia azurea, Psoralea esculenta, P. floribunda, P. canescens, Cassia chamæcrista, Rosa blanda, R. foliolosa, Phalangium esculentum, Monarda oblongata, Coreopsis tripteris, C. palmata, Tradescantia virginica, with varieties from the purest white to the darkest purple; Zizia aurea, Pedicularis canadensis, Anemone Pennsylvanica, Clematis viorna, Fragaria sp. (?), Symphoricarpus vulgaris, Gerardia angustifolia, Seymeria macrophylla, Lilium uniflorum, Lythrum virgatum, Phlox divaricata, P. suaveolens, Senecio aureus, Oxybaphus (Calymenia) Nyctaginea, Talinum parviflorum, Malva pedata, M. involucrata, Ceanothus mollissimus, Psoralea argophylla, Petalostemon violaceum, Desmodium acuminatum, Schrankia uncinata, Darlingtonia brachypoda, Geum virginianum, Potentilla arguta, Polytænia Nuttallii, Œnothera speciosa, and others. We now commenced a tedious and uninteresting journey along the plains of the Platte River, and for several days the flora on the plains was very meagre, if I except two species of Mammillaria and the Opuntia Missourica, O. cylindrica, with a fine variety of Grasses. On the 21st of June we ascended to the upper prairie, when a gay floral scene was presented to our view. The rich yellow of the Coreopsis tenuifolia predominated, but was enchantingly variegated with the white bloom of the Pentstemon albidus, the scarlet of the Sida coccinea, the various shades of the Tradescantia virginica, and the different species of Astragalus, diverging from the purest white to the darkest crimson. From the south to the north fork of the Platte, I observed the neat Evolvulus argenteus, Lupinus pumilus, L. sp (?), Erysimum asperum, Ervum pusillum, Cleome integrifolia. Several plants were found in this region which were entirely new to me, particularly a dwarf shrubby Œnothera, the finely-pencilled rose-coloured flowers of which were very much admired. I also observed Lathyrus linearis, Ceanothus Americanus, Amorpha fruticosa, Oxytropis Plattensis, Œnothera rhombipetala, Vernonia fasciculata, Aster cordifolius, A. oblongifolius, A. Novæ Angliæ, Duteria coronopifolia, D. pulverulenta, Erigeron bellidiastrum, E. glabellum, E. strigosum. Coreopsis tinctoria, Lobelia spicata, and L. siphilitica. On the 27th of June we made the North Fork of the Platte; the surface of the ground became more varied; rocks began to make their appearance, with a range of hills composed of soft marl of an earthy formation, and consequently plants were more abundant. As we descended from the upper plains a variety of species were found, among which may be enumerated a species of Oxybaphus (?) or Calymenia (?) Œnothera pinnatifida, O. speciosa, Yucca angustifolia, a most beautiful species of Eriogonum. Œnothera albicaulis, O. trichocalyx, O. biennis, O. Drummondi, O. coronopifolia, O. cæspitosa, O. pinnatifida, with several other unknown species; Potentilla anserina, P. arguta, Thalictrum megacarpum, Argemone Mexicana var. albiflora, Helianthus two species; Nasturtium palustre, and among the hills a beautiful crested Pentstemon. This brings me to Fort Laramie, a trading station of the American Fur Company. From thence to the Sweet-water of the Platte, among other plants may be mentioned a pretty species of Aster, three species of Calochortus, and Galardia bicolor. At a small stream called Bitter Creek, several acres were densely covered with a species of Delphinium of the richest azure blue, and most agreeable odour; Pachypodium integrifolium, Vesicaria didymocarpa, Polygala alba, Linum rigidum, Pelargonium Fremontium, Rhus triloba, Purshia tridentata, Glycyrrhiza lepidota, Apios tuberosa, Psoralea campestris, P. tenuifolia, P. lanceolata, Petalostemon candidum, P. villosum, P. violaceum, Astragalus gracilis, Phaca longifolia, and several other species; Kentrophyta montana; Lupinus, four species; Cerasus Virginiana, Campanula rotundifolia, Rubus strigosus, Epilobium coloratum, E. spicatum, Mentzelia nuda, Ribes cereum, R. lacustre, R. irriguum, Sedum rhodiola, Sium incisum, Cornus stolonifera, Symphoricarpus occidentalis, and Galium boreale. On the 17th of July, while all were occupied in crossing the North Fork of the River Platte, I paid a visit to the highest range of the Black Hills, a distance of eight or ten miles, and was rewarded by finding several species of Euchroma (Castellejas), Claytonia virginica, on the margin of a dense mass of snow; species of Silene, Cerastium, Viola, Pelargonium, Lupinus, Frasera, Erysimum, Œnothera, Batschia, Geum, Pinus, Abies, Juniperus, and the beautiful Lewisia rediviva, with several unknown genera.

On reaching the beautiful winding stream called the Sweet-water of the Platte, we found we were fast approaching the mountains. While passing through this arid region, days would elapse without our finding a single plant that was worthy of notice. The whole ground was literally covered with different species of Artemisia. In many instances the floral goddess seemed to have deserted us. However, in more favoured spots I was enabled to enumerate the following, viz.:—Brickellia grandiflora, Aster multiflorus, A. falcatus, Erigeron canadense, Gutierrezia euthamiæ, Solidago rigida, S. Missouriensis, S. speciosa, S. gigantea, Aplopappus spinulosus, Grindelia squarrosa, Franseria discolor, Helianthus petiolaris, H. Maximiliani, Cosmidium gracile, Bidens connata, Hymenopappus corymbosus, Artemisia Ludoviciana, A. frigida, A. canadensis, A. cana, A. biennis, A. Lewisii, A. rediviva, Stephanomeria runcinata, Gnaphalium uliginosum, G. palustre, Cacalia tuberosa, Mulgedium pulchellum, Lygodesmia juncea, Glaux maritima, several species of Pentstemon, Teucrium canadense, Lycopus sinuatus, Stachys aspera, Scutellaria geniculata, Mentha canadensis, Lippia cuneifolia, Onosmodium molle, Myosotis glomerata, Phlox Hoodii, Polemonium cœruleum var., Calystegia sepium, Gentiana affinis, G. Fremontii, and two other species; Frasera speciosa, Asclepias speciosa and three other species, Kochia dentata, Eurotia lanata, Fremontia vermicularis (I believe the Batis vermicularis of Hooker), Oxybaphus sp (?), Polygonum persicaria, P. aviculare, P. viviparum, Rumex sp. (?), Shepherdia argentea, S. canadensis, Sisyrinchium anceps, Iris Missouriensis, Allium reticulatum, Smilacina stellata, Zigadenus glaucus, Eriogonum annuum, E. umbellatum, E. Fremontii, E. cæspitosum, E. ovalifolium, and three other species; Gentiana aretophylla, Elæagnus argentea, Polygonum amphibium, Gilia sp. (?) (splendid), Pulmonaria ciliata, Pedicularis surrecta, Castelleja pallida, C. miniata, and two other species; Mimulus sp. (?), Orthocarpus luteus, Dodecatheon dentatum, Arctostaphylos uva ursi, Senecio triangularis, Helianthus uniflorus, Balsamorrhiza sagittata, Iva axillaris, Phaca ternata, Aster integrifolius, A. adscendens, A. novi Belgii, A. elegans, Potentilla gracilis, P. fruticosa, P. diversifolia, P. sericea, Sibbaldia procumbens, Thermopsis montana, Astragalus hypoglottis, Parnassia fimbriata, Arenaria congesta, Berberis aquifolium, Actæa rubra, &c.

The above names are according to Dr. Torrey, who had the arranging and naming of a collection of specimens collected by Lieut. Fremont, of the U.S. Army, and who had gone over our route, in a great measure, during the summer of 1842.—*Alexander Gordon, London.*

Home Correspondence.

Summer Pruning.—In the case of the Gooseberry this is frequently neglected, but it is worthy of attention for several reasons. The first is, that by cutting off the summer shoots a greater proportion of sap is directed to the fruit. Where summer pruning is not performed this is lost in the production of useless spray and foliage, which moreover retards the swelling and ripening of the fruit by shading it from the influence of sun and air. Pruning is, on that account, necessary, in order to have large, well-flavoured berries; and it also, by concentrating the sap, in a great measure aids the formation of more fruit-buds for next year, and renders them more vigorous and healthy. The shoots, however, ought not to be cut off too early, as this would perhaps cause the tree to push new shoots again instead of forming fruit-buds; neither would I prune to the base of the shoots, as that would cause the buds at the bottom to push, and perhaps convert some of those formed for fruit into wood buds. My plan is to begin about the end of June or beginning of July (according to the earliness of the season), and cut away all the suckers from the bottom of the bush pretty closely. I then cut off the summer wood along the main branches with pruning-shears, which are speedier than a knife, cutting more or less off the shoots, according to their strength—say about half off a weak shoot, and one-third off a strong one, or perhaps less, it being best to err on the safe side. In some cases merely pinching off the points is sufficient, for by taking too much off you may cause the shoot to push anew. If after this pruning the bushes make more new wood, they may be looked over and the young shoots topped, but take care not to top the leading shoot of a main branch when the bush is young, and has not arrived at its full size. Another reason in favour of summer pruning is, that it makes the bushes have a much neater appearance; it also leaves less shelter for the caterpillar and other vermin. All the young shoots that are thus stopped should be pruned back to one eye in the winter or spring pruning. With regard to the summer pruning of Apple and Pear trees the same remarks are applicable. In pruning these it is common to cut the young shoots close to the spurs, or to rub them off as they appear; but this is a practice of which I do not approve, for by so doing more young wood is always encouraged, and consequently fewer fruit-buds are formed. My method of pruning wall or espalier Apple and Pear trees is this:—I never rub off the wood-buds, but let them grow until the month of June or July, when I go over the tree and shorten the shoots according to their strength and vigour. When young shoots appear after that time, do not rub them off until they are of considerable length, otherwise they would push again, and carrying off the sap, would impair the vigour of the fruit-buds. Thus, by stopping the summer wood in proper time, new fruit-buds are formed, and the others are more matured for the succeeding spring. Some may object to the untidy appearance of the trees on walls having part of the young wood sticking out, and may say that it in a great measure deprives the fruit of the full influence of the sun. But this is not the case, as a moderate shading is not against fruit, and the productiveness of the trees will fully compensate for the untidy appearance. If the above method was fully practised, we would hear of fewer complaints about bad crops on wall and espalier trees.—*A. W., Muiryfold Grange, Banffshire.*

Canker in Fruit Trees.—In April, 1843, I worked some grafts of the Crofton Apple on a young stock; they went through the usual process remarkably well; and when I removed the clay, &c. everything appeared in a healthy state. On examining the stock during the following spring, 1844, I found it so extensively cankered that I was obliged to cut almost through it, in order to eradicate the decayed parts, leaving but a small portion of the back. Fearful of losing my tree from the dryness of the season, and hoping to induce the wounds to heal, I covered the stock up to the grafts (about 16 inches) with rich soil. The result of my experiment has been most satisfactory. The injured parts are forming new bark round the edges, and the stock is throwing out beautiful roots from the eye below the grafts.—*Falcon.*

Pear-Pruning, by "Observer."—Before his well-written observations are acted upon, one should like to have Dr. Lindley's opinion upon his mode of pruning, as well as that of the leading gardeners, through the medium of the *Chronicle.—July 13th*, 1844.

Quick growth of the Pear.—I have in my garden two grafts of the Gansel's Bergamot, and two of the Beurrée D'Aremberg (worked on a Windsor Pear stock in April, 1843), now covering one hundred feet of wall. Is not this rather an extraordinary instance of quick growth?—*Falcon.* [Very.]

Pears.—The introduction of so many good kinds of Pears of late is a very great acquisition. Some of them not only surpass many of the old kinds in flavour, but also in fruitfulness, even in situations where some of the old sorts do not bear well. Witness, for instance, the fine fruit of Napoleon or Marie-Louise, on a north-west wall, where the Crassane and Brown Beurré are cracked and gritty. The Marie-Louise succeeds better on a west or east aspect than on a south one; this is owing to its being retarded in such situations until the weather becomes warmer; it blooms too soon when exposed to the south, and consequently suffers from cold and frosty winds. Many of these lately-introduced varieties keep much longer than the old ones. When this is fully known, we need not be surprised to see Pears take the place of Peaches and Nectarines, which are difficult to keep, especially in late seasons. Though the fruit of both are excellent, yet they are of short duration; whilst a good collection of Pears will last during winter and spring when fruit is most wanted. It is not unusual to see fine walls covered with old barren Pear-trees, which might be rendered fruitful if they were grafted with new kinds. I observe in a back Number of the *Chronicle* an opinion by Mr. Hayward respecting ripe Pears. He says—"No Pears, if gathered and eaten when fully ripe on the tree, are so good as when gathered as soon as they have attained their full size, and laid by in a dry place until they are ripe." This writer surely cannot mean that Pears ought to be gathered immediately when they attain their "full size." I consider it is better to let them hang on the tree until they give warning by dropping, or until their stalks part freely from the tree; for, in my opinion, many of them, and especially late kinds, are gathered too soon. At present (Nov. 7), I have several kinds of Pears yet on the trees; they seem to be improved in quality. If Pears are gathered too early they become tough and wizzened.—*J. Wighton.*

Gooseberry Seeds.—This is the proper time to sow Gooseberry seed. This season has been very favourable for the finest and most delicate sorts to ripen; and I would recommend those who wish to obtain improved varieties to sow the seed in shallow seed-pans, placing them in a cool frame; the seed can be separated by mixing fine sand with the pulp, and rubbing it out. This operation over, sow immediately, and keep moderately moist the soil in the pans; when the seedlings are up, and have got four leaves, let them be exposed altogether to the weather; but I would advise their being kept in the pans, and again placed in a cold pit, and finally planted out in rows, 2 feet apart. In the spring they will fruit the second year.—*Anon.*

Gooseberry Caterpillar.—Among the many prescriptions for getting rid of this troublesome pest, is one which, for simplicity and efficacy, cannot be made too well known. It is this:—When the bushes are wet, either after a shower or after having been watered with a garden-engine or watering-pot, dust them over with a little dry soot. The caterpillars desert them immediately after the application, and the first shower cleans the bushes of the soot.—*D. F., Woodhouselee.*

Pruning Forest Trees.—In a late *Chronicle* I observe a remark, made by a writer signing himself "Quercus," to the effect that, with reference to the growth of Oaks and the pruning of them, "he never yet saw a magnificent stem that had not a proportionately large head." But I would beg to ask him whether he has not seen many a magnificent head that had not a proportionate stem? I well know that I have, and that I have indeed now some such in my view; yet would I not on any account have that disproportion in them altered, forming as they do an ornamental feature in my grounds; though in respect to others growing in a coppice, where ornament is not such an object, I would gladly exchange the branching honours of their heads for the solid cubic contents of a long stem, from which, when felled, the builder might be able to cut his stout beam and girder, of 25 or 30 feet in length. Every one, doubtless, loves to behold in the rich domain a magnificent Oak, extending far and wide its enormous branches, as if to protect the soil that had nourished its increase, and enabled it to withstand the storms of many centuries. Few objects in the creation present a more imposing spectacle. But for useful purposes, surely it were desirable to grow clean straight timber; and if the zealous planters of the present generation were but to plant Oak more largely (instead of the Beech, and other trees of little use except for fuel), I cannot but think it might again become sufficiently abundant to be extensively used, as formerly, in our buildings, in lieu of the perishable material now generally employed. But such timber can only be obtained by paying more attention to young plantations than is usually bestowed upon them: in the first place, with respect to thinning; and, secondly, by judiciously pruning the young trees. By the neglect of the first operation, the Larch, and other trees that should nurse the Oak in its infancy, will very soon altogether destroy, or sadly weaken it; and, for want of pruning, numbers of the young trees will remain stunted from want of nourishment (except, perhaps, in very congenial soils), or distorted in their growth by the irregular diffusion of the sap among the branches, and the consequent want of a vigorous leading shoot. Having had the experience of near forty years as a rather extensive planter (during which I think I may say I have personally given more attention to the subject, and especially to pruning, than most gentlemen), I will venture boldly to affirm, that increased vigour, stature, and bulk, will ever be the sure result of the judicious pruning of the Oak, whatever any theorists may advance to the contrary.—*W. H.*

Action of Roots.—In illustration of the fact that plants draw all their nourishment from the small roots at their extremities, and are little, if at all, affected by having the larger parts exposed to the weather, I have lately had a convincing proof. In repairing a vinery, I was desirous to have the front wall, which was originally of solid brick-work, built on arches, for the benefit of some of my best Vines. They are planted in the inside of the house, but I have some on the outside likewise, which I wished to retain until their places are supplied with young ones. From these it was necessary that all the soil should be removed; and knowing that it was a stiff adhesive clay, and that there would be few small roots close to the stem, I commenced at it and removed the soil away for a distance of three yards. In that state the roots lay exposed from the end of March to the beginning of May; nevertheless I find that the Vines have broken as strong as usual, and show about the same quantity of Grapes.—*J.M.*

Plant Brokers.—If a new plant could be as readily got as a new book, the trade would be benefited. Why should not there be brokers, who would undertake to execute an order for plants raised in the neighbourhood of London, just as a wholesale bookseller in town executes an order from the country, though it may be for not a single book of which he is the professed publisher? The present system of the trade acts as a check upon their own profit, no less than the grievous charges made by carriers for parcels of small weight.—*Richard Tongue.*

Acclimatising Plants.—I am of opinion that many of our greenhouse plants, particularly those from the Cape, may be cultivated in the open air, even in our uncongenial climate, with greater success than is generally supposed. In proof of this, I planted out last autumn two plants of Cacalia, one ficoides, L. and the other articulata, on a small rock-work, at the end of a vinery. Not being disposed to take them up and reset them, I left them to take their chance. While they were out of doors a sharp night's frost set in, with a cold and high wind. I naturally expected to find the plants destroyed, but upon examination, I found that they were not the least injured. When the next frost appeared, I covered them with a little hay, which was removed as soon as the frost went away, and now the plants are growing freely. Along with the Cacalias was a plant of Aloe soccotrina, (De C.), the leaves of which were destroyed, but the roots were spared, and are now sending up two fine suckers. While speaking of this species of Aloe, I may observe, that the leaves of this plant are much sought after here for burns, &c.; the leaf is cut in half, lengthways, the fleshy side is then laid upon the burnt part, and it is said that it greatly abates the pain. So much are these leaves sought after by the inhabitants of Hillsborough, that our plants are greatly mutilated by cutting off the leaves for them. Now, if these fleshy-leaved plants will survive our winters with a slight covering, why not hard-wooded plants, from the same country? At the same time, I put out a plant of Goodia lotifolia. This stood a frost of 5° without the least protection, and in a very exposed situation, but the second frost, which was very severe, and of long duration, killed the plant to the ground; but upon examination, I found the root, and that part of the stem which was under the ground, as fresh as when planted; and I have no doubt but that the roots would have sent up suckers, which this plant is very apt to do, if it had been left in the ground. I ought also to mention that the shoots were of one year's growth, and quite tender, which was greatly against it. I am, however, fully convinced that if the plant had been protected, it would have survived the winter. The Clianthus puniceus stands out here against the end of a vinery, with a very slight protection, and that only on very severe nights, and flowers abundantly in spring. I would recommend this plant to be cultivated as a standard in sheltered situations in flower-gardens and pleasure-grounds. It should be protected with a few Fir branches, or old mats; its beautiful scarlet flowers in the spring months will amply repay the trouble. Azalea indica alba also stands out here in the flower-gardens, and flowers freely, with a few Fir branches laid over the tops of the branches on very severe nights; this plant is generally cultivated in the greenhouse, summer and winter. It will, however, thrive much better if kept, during winter, in a cold frame or pit; when wanted for flowering, it should be placed in the greenhouse. I formerly stated that Fuchsias ought to be abundantly cultivated in the open air: of the importance of this I am every day more and more convinced; and it is my opinion that they ought all to be thus treated, with the exception of those which are intended as specimen plants, for exhibitions, &c.; but for the tender species and varieties, I would recommend a covering of old tan, short dung, or a spadeful of earth, to be laid over their tops after they have been cut down. F. fulgens stood out this winter here, protected in this way. Now, if fulgens, which, in its young state, is amongst the softest-wooded species we have, stands out with a slight protection, why not others of a hardier nature? I trust that these observations will induce some of your correspondents to give the results of their experiments on this subject; for I feel confident that we shall hear of plants which are now choked up in greenhouses, growing freely in the open air with little or no protection during winter; and of those plants which are now burnt up in a stove, growing and flowering freely in the greenhouse.—*John M'Intosh.*

Influence of the Moon on Plants.—A notion was formerly very prevalent among gardeners, and perhaps exists to some extent at present, that the light of the moon has an injurious influence upon plants, particularly in the months of April and May. The name of *Lune Rousse* is given by the French to the April moon, from the influence it is supposed to exert on the leaves of plants, in turning them brown. M. Arago has shown that this notion is erroneous, the effect alluded to being clearly owing to another cause, but one which must necessarily be in active operation on bright moonlight nights. He observed that in the months of April and May the temperature at night is often not more than four or six degrees above the freezing point; and under these circumstances, when the sky is most unclouded and the moon shining brightest, heat will be radiated from the earth sufficient to reduce the temperature at the surface some degrees lower, or below freezing point; hence the tender leaves and roots of plants are nipped by cold, and that appearance given to the former which is intended to be conveyed by the French word *rousse.* I have been induced to offer these observations from

the practical bearing which they appear to have on the subject of morning and evening watering of plants; and I imagine that it is consistent with a just view of the subject to affirm, that in regard to out-of-door plants morning watering alone should be resorted to during the spring months, even to the end of May in our uncertain climate. We cannot prevent the refrigerating process which more or less is going on at the surface of the earth in the cold clear nights of spring; but we may, at least, avoid artificially assisting it by putting the earth just in the most favourable condition for producing cold. It is so placed, when the surface is newly watered, because evaporation, and consequently congelation, is most active when it is in that state. I may illustrate the comparative influence of morning and evening watering, in relation to this subject, by what takes place when several folds of wetted cloth are applied to a vessel to cool the contents. As long as the outer cloth is wet, the evaporation goes on unobstructed and the temperature of the vessel is proportionably reduced; but as soon as the external covering loses its moisture, the process languishes, though the inner folds are still wet. So in morning watering, the surface moisture is evaporated in the genial temperature of daylight, without injury to the plants, and when night comes on, the surface is comparatively dry, and evaporation cannot go on so actively, however clear the atmosphere. In evening watering, on the other hand, we prepare the ground for an energetic evaporation going on during the night; consequently chilling the earth and plants growing in it, at a time when the low temperature of the air is more than sufficiently adverse to the well-being of the latter.—*J. H. H.*

To keep Shrubs from Windwaving.—Among the different methods that have been used to prevent injury to transplanted shrubs, arising from their being shaken by the wind, the simple plan of pegging down their lower branches seems to be the cheapest and best. The forked pegs used for this purpose should be made with one side about half the length of the side from the principal branch, and a head six or seven inches in length should be left for the prevention of splitting, on being driven into the ground. In hard ground the holes, especially for large plants, should be opened with an iron bar, to save labour in driving, and waste of forks. The elasticity of the branches when well secured, preserves the removed plant remarkably steady during the action of heavy gales of wind, and if the ball of earth is of moderate size, and of the usual proportion to the size of the shrub, it is singular how small a twig is sufficient to support it in bad weather. The branches may be cut, and the pegs removed from shrubs near walks, towards the end of the ensuing summer; in other cases they may be left to die, or grow and form layers for masses of shrubs, according as light and air are admitted or excluded. Ropes give and take in dry and wet weather to such a degree as to be useless as stays. And even the fastenings of pole stays are almost sure to become loose enough in dry weather to allow the bark to be chafed. Stays of all kinds ought to be applied whenever practicable to the branches, rather than the main stem; and each stay should have a separate fastening. Comparatively little injury is done even if the bark of branches is compressed too much, or rubbed, and in many cases branches by such means may be weakened to the improvement of the plant. Under circumstances where expense is a secondary object in the removal of valuable trees or shrubs, or it is of consequence to secure common trees, iron-wire stays of $\frac{1}{10}$ to $\frac{1}{20}$ of an inch in diameter, with a stuffed clip round branches secured to pegs, or to posts, if cattle were admitted round the trees, would form a secure fastening capable of lasting a considerable period, and of being used for different trees in succession, in which case its cost would be much less than rope. In reference to the success of transplanting shrubs or trees at different periods of the year, if parties took more notice of all the circumstances attendant on their removal, perhaps several points of greater importance might be observed, for instance:—1. Removal from a greater to a less exposure, for the sake of obtaining a free growth of leaves, which are of greater importance even than roots. 2. Removal from worse to a better ground, either natural or artificial. 3. Removal to land which can be readily penetrated by the young roots of plants; the easiest means of obtaining this essential quality is by mixing loose stones of any kind with the soil; when the tree or shrub gains strength it will usually take care of itself. 4. The removal of trees or shrubs in a healthy but not luxuriant state of growth; cutting round the shrubs some time previous will soon cure the latter defect, and insure subsequent success. It is most valuable in all cases, but occasionally it will be advisable to encourage the growth of fresh roots by good or rich earth added to the trench. Convenience causes these important points in numerous instances to be disregarded, but a due attention to their relative value would enable a planter of moderate experience to predict the comparative success or failure of removals, supposing in each case that the trees or shrubs were equally well planted, in their new position.—*E.*

Transplanting Forest Trees.—I observed in the *Chronicle* of March 30, a statement from a correspondent signing himself "E.," regarding the transplanting of large forest-trees, and expressing a wish for information respecting the preparation of them "before transplanting." As far as my experience goes, I would be inclined to give preference to trees prepared in July. The selection of the tree, however, for its situation, is of more importance to its future success than preparation. For instance, take a plantation that has stood for years pretty thick, cut out the greater part of the trees, leaving at distances of 60 or 70 yards two or three trees together: those trees, on being suddenly exposed, although not moved or touched at the roots, will become as stunted and ill-thriven as if they had been taken from the same situation and transplanted in any other, similar to the one referred to before the wood was thinned. This I know from experiment. "E." has given a statement of the expense of removing his trees, but has omitted to say how far he did remove them; consequently he has left us in the dark. I cannot agree in his tearing up the tree after clearing its roots of soil on the surface, for this among other reasons, that if the tree happened to have (as a good many of them have) a strong tap-root, before this is removed the force of tearing up the tree will necessarily shake away all the earth from the other roots, because of the resistance the tap-root offers to any force in any way applied to turn the tree over.—*Clouden.*

Dwarfed Fig-tree.—I have in my possession what I believe to be a unique curiosity in this country—a Banyan-tree, dwarfed in China, and known to be 200 years old! It was sent to me by a friend in India, and was traced back from one possessor to another in that country for the time above mentioned, having always been regarded as a great curiosity. It arrived, unfortunately, during a severe frost, two years ago, which affected it on its journey from London (having been exposed for one night to the open air), and one of its principal branches was frost-bitten to such a degree, as to make it necessary, in order to save the life of the tree, to have the branch cut down. The other remains perfect. I am aware that there are dwarfed Bannian-trees in other collections in the kingdom, but none, I am given to understand, of so small a size, and of so great an age. I am credibly informed that the Chinese have lost the art of dwarfing forest-trees in this peculiar manner. It has not been removed from the China vessel in which it came from India. Its height is only 2 feet, circumference of one stem 7 inches, of the other 11 inches. It is now in vigorous health, is kept in the hothouse in the winter, and put into the sun during the summer months, removing it at night. It requires very little water. It is a tree of great beauty, and its form is a perfect study for the artist.—*E. C.* [This is not a Banyan, but a curious specimen of Ficus nitida.]

Pine-Apples.—In reply to "A. B. C.," in a late number, I beg to mention that, in different places which I have lately visited, I have observed that the tank-system is not well adapted for the growth of the Pine apple in all its stages; it is better suited for the forcing of Melons, Cucumbers, Asparagus, &c. He states that his house is in three compartments, that the first is composed of wooden stages, and that the pots are suspended by their rims in the same; I imagine this would be the best compartment of the three for fruiting the plants in, more especially about the time he wanted them to fruit. By withdrawing the water from the dishes, having a gentle heat given out by the pipes alone, and at the same time giving little or none to the root, for a few weeks (the plants being strong, and the pots full of roots), would throw them into fruit. I am of opinion that the tank-system disappoints the generality of Pine-growers; many admit that by that system they can produce noble-looking plants, with fine foliage and healthy action, but this is at the expense of the fruit. I do not agree with a statement in Macintosh's "Practical Gardener," which says, "that Pines starting into fruit in August are tantamount to being lost;" as, in large establishments, gardeners are obliged to have a succession for the most part of the year; and of Pines—say a variety of Queens, Black Jamaica, and Montserrats, if strong, healthy plants—showing fruit in August, the Queens would ripen good fruit by the end of October, and the Jamaicas and Montserrats would come in in succession up to Christmas, and even much later; the two last are well known to be the best, both in point of swelling and flavour, for winter fruit. I would recommend "A. B. C." to put his strongest plants in that compartment having the stages, and, if practicable, to withdraw the water from the dishes, and likewise to discontinue watering at the root. The following plan I have often practised with success upon strong plants of shy bearing kinds, such as the Black Jamaica is allowed to be, viz.—with a pair of scissors cut off the tips of the leaves in the hearts of the plants, and continue to do so to others as they spring. This stops their over-luxuriant growth, and the change from excess of moisture to partial dryness, disposes them to fruit, when water might again be added if thought necessary. At all events, I should not discontinue moistening the pipes and pathways after every bright day, and the house should be shut up early in the afternoon.—*James Roberts.*

Pine-Apples.—Those who have the good fortune to reside near good peaty soil, need not be afraid of using it wholly in which to grow Pines. The plants that I fruited in all peat, swelled better during the winter months, and produced finer fruit than those planted in either rich soil or turfy loam. For plants that are to fruit in winter, peat is excellent, on account of its loose texture. Pines planted in a mixture of half charcoal and loam, have fruited very well. All sand gives no one cause of complaint; on the contrary, it should rather be recommended, for the roots become very strong in it, and the rootlets are much more numerous; indeed, I never saw roots so strong and numerous in any other substance. It is not of much importance what kind of material Pines are grown in, provided the roots are in a healthy active state, and free from sudden changes of bottom-heat. The soil in the pot should also be kept from becoming soured by allowing decaying bark to adhere to the outside of the pot. Keep out worms by placing the pot, when plunged, on a flat brick.—*W. Brown, Merevale.*

Opposite Opinions, Rooks, &c.—The various, and in some instances contradictory statements, of your correspondents, must, in many minds, create a tendency to scepticism; that is to say, where parties do not make practical observations and judge for themselves. One states that salt has produced him magnificent Asparagus—another says that salt has destroyed his plants. One advises carcases as a manure for Vine borders—another says that has nearly destroyed his Vines. One says that for 30 years he has not suffered from Turnip fly, owing to his steeping his seed in oil, and powdering it with sulphur—another says he has tried it, and still the vermin have marched in military array over his field, perforating and consuming his crop. One says persecute the rook and other birds—another, encourage them as your best friends. As great a contrast frequently arises as to the quality of fruits—one stating a particular variety to be excellent—another will not admit it to be second rate. How are we to reconcile such statements, admitting, as we must, in respect of parties with whom we are unacquainted, that each is entitled to equal credit? In many instances, no doubt, the old aphorism may be applied—"Circumstances alter cases," as with regard to salt and carrion manure; a skilful gardener, knowing the time, and watching the result of his experiment, follows up a perceptible improvement, and counteracts the first appearance of a retrograde movement before the disaster becomes irremediable. In similar cases, the rash or inexperienced fail. With regard to the Turnip fly also, there may be some peculiarity of tillage. I have heard of a whole field failing except where a roller had casually been drawn—in some seasons, that the plants are more liable to attack when the ground is rolled. As to fruit, there can be not the least doubt that soil and aspect, or climate, will produce a much greater difference than exists between the first and second class. But with regard to the rook and birds generally, I think there ought to be but one opinion, namely, that their usefulness very greatly exceeds any injury committed by them, either to the farm or garden. An instance is recorded upwards of a century ago, I believe by Bradley, of the inhabitants of a certain village destroying the whole race of birds in their locality, by setting a price upon their heads; the consequence of which was, that their entire produce was attacked by insects and caterpillars innumerable the following year, and they were glad to offer a similar or greater reward to have fresh colonies brought in to their assistance. Dr. Stanley also relates that a whole district in Germany was nearly deprived of its corn harvest by having destroyed their rooks. I have myself seen a field of Swedish Turnips so infested by grubs, that from three to ten were found under nearly every root that was examined, the Turnips having the appearance of warty excrescences and quite hollow within. An immense flock of rooks, accompanied by a flock of starlings, covering more than an acre, alighted upon them, and so busy were they that they would allow a person to go within a few yards of them without flying up. They remained there a whole afternoon, and on examining the Turnips afterwards, I found scarcely one that had not been cleared of the grubs. That piece of ground has been much more productive from that time; and I think at least some share of the improvement is due to the rooks, though certainly not all. As to sparrows and other small birds, particularly wagtails, a careful observer may see them in breeding time following the plough or scarifier, dart their beaks into crevices and pick out the wire-worms incessantly, then carry them to a smooth piece of earth, lay them in a bundle, and then clasp them firmly in their beak and carry them off to their young. Now suppose the rook in searching for grubs pulls up the plant with it, would not the vermin have ruined it in all probability if he had not? And allowing that he pulls up some Potatoes on the moor lands, a little expense of watching obviates that calamity. Also allowing that sparrows will do considerable damage to the Wheat crop from the time the grain is formed until harvested—a period of six weeks or two months—wasting as much as they eat, yet a few old men, for a few shillings per week, may check their depredations over an extensive farm. But by what process, involving fifty times this outlay, could man himself perform the service rendered him by these active labourers, who never want calling to their employment—are never idle when there is any prospect of their working to advantage—who never call upon their protector on a Saturday night. Prejudices often take deep root, and are handed down from ancient to modern times; sparrow clubs are still in existence; and I was informed a few days ago of a person sending 3000 heads to a member of one club, and having to send 3000 more to be exhibited as the genuine trophies of that individual. He also may consider he is doing man a service; but unless I receive further evidence to the contrary, I must continue in the opinion that birds are eminently serviceable to man during at least ten months out of the twelve; that there is no known substitute for their services; and that any injury which they might effect during the rest of the year may be easily and cheaply prevented.—*F. J. Graham, Cranford.* [What a pity it is that people should not have sense enough to attend to these true and excellent suggestions!]

Moss on Gravel Walks.—I sometimes destroy Moss on walks in a very simple manner. It is commonly when the surface of the walk is smooth and moist that Moss abounds; winter is the time best suited for destroying it. By watching a certain degree of frost it will be observed that the surface of the walk, by the expansion of the ice,

will be somewhat loosened, and the Moss thrown out; I then sweep with a stiff broom, or scrape with a draw-hoe, and clean it up afterwards. If the frost is too slight the Moss will be but partially removed, and if too severe, too much of the surface will be loosened; but when a proper opportunity occurs, millions of plants may be destroyed in a short time, and the walks look much refreshed afterwards.—*Peter Mackenzie.*

Gravel Walks.—The following is an excellent plan to make (or turn over these in dry weather):—If of a sandy or gravelly nature, strew a little clay or marl upon the walk. When turned over, take away the large stones and place them at the bottom of the soil. Immediately after you level your walk, apply your iron roller steadily, and let a labourer follow the roller, pouring upon it water regularly as it passes over the ground; in 24 hours after, if the weather is dry, it will be as solid as a stone floor. The writer has had ocular demonstration of the fact in 20 instances, in the late dry weather.—*W. R. Hanwood, Liverpool.*

Conservatory Climbers and Fixed Roofs.—In pursuance of the advice given by Mr. Beaton, I had the only sliding sash of my conservatory fixed with screws; and in the hot air thus confined, several of the climbers have certainly flowered far more freely than before. Bignonia Cherere is now splendidly in bloom, as are Ipomœa Learii and Mandevilla suaveolens, which promises to bear a succession of its fine flowers through the autumn. Bignonia jasminoides is also producing its blossoms of almost peerless beauty in large masses; but several other plants do not seem to like the heat. I have several fine specimens of Kennedyas, Zichyas, and Hardenbergias, which, after reaching the top of the pilasters between the windows, are carried along the arches forming the support of the climbers; in this situation the leaves and branches have been quite burnt, and the same effect, though in a less degree, has been produced on Bignonia grandiflora, which, for the sake of its flowers, I still retain in the house, though, doubtless, perfectly hardy in this county. Will any one recommend me a few more climbers that will bear the temperature produced by the fixed roof, either to be planted in the border, or to be inarched on those now growing? Various fine Bignonias and Ipomœas I conceive might be introduced, and there are possibly some things that would unite with Mandevilla. I have lately added Bridgesia spicata, Brachysema villosum, and Beaumontia grandiflora; but the latter seems a slow-growing plant, and, I fear, will be some years old before it blooms. The Brachysema I understand is a fine thing, and will of course not attain the height of its stronger-growing companions.—*A Devonian.*

Longevity of a Pæony.—A plant of the double crimson Pæony is growing at a cottage-door, at Great Chesterford, in Essex, which is known to have occupied that identical spot 100 years. The grandfather and grandmother of the woman who now lives there were both born about 120 years ago, and could not remember the time when it was not there. It is not a very large plant, sending up 16 stalks. That it lives by the permanency of the original tubers, and not by the formation of new ones, may be inferred from the identity and minuteness of the spot of ground, which it occupies without spreading. Is it ascertained that herbaceous perennials are of shorter life than the Oak or Chesnut?—*A. H.*

Stipa pennata.—It is not generally known that the seed of the Stipa pennata produces a flour very much like that of Rice; and, I have no doubt, on poor sandy soils, would produce a bread Corn, where scarcely anything else would grow.—*Anon.*

Tall Stock.—I have a stock which measures the great length of 2 feet 11⅝ inches from the top of the bloom to the last seed-vessel; the stem was cut as close to the seed-vessel as possible.—*Mede.*

Village Horticultural Societies.—Your remarks on the necessity of showing in classes are perfectly true; but, except in the three classes of Gentlemen, Nurserymen, and Cottagers, I do not see any sufficiently broad distinction to make further classification practically useful. The Squire, with his head gardener, hot-houses, &c., will no doubt carry off many of the prizes, but the amateur will very often beat him with his Florist Flowers, Pelargoniums, Fuchsias, and those requiring only greenhouse, or frame; and the Tradesman will generally beat both with his Auriculas, Tulips, Pinks, or Pansies. I have taken the trouble to analyse the number of prizes gained at our last Exhibition, where subscribers all show against each other; and I have subdivided them into four classes:—

1. Gentlemen, with head gardener, hothouses, and every advantage.
2. Amateurs, with one gardener to assist them—mostly a common labourer.
3. Tradesmen, working their own gardens.
4. Market gardeners, who employ men under them.

Eight of the first class contributed 121 articles for exhibition, and obtained 32 prizes, (or about 1 in 4.)
Ten of the second class contributed 69 articles for exhibition, and obtained 14 prizes, (or about 1 in 5.)
Twelve of the third class contributed 36 articles for exhibition, and obtained 13 prizes, (or about 1 in 3.)
Three of the fourth class contributed 22 articles for exhibition, and obtained 7 prizes, (or about 1 in 3.)

You will see by the above that the disproportion is not very great between the Amateur and the Gentleman, and that the Tradesman obtained a greater proportion than either. In the Cottager's Class, 53 Cottagers contributed 137 articles, for which 32 prizes were distributed among 24 of them. This was in a country village, the population of which does not exceed 1200, but the Cottagers of all the neighbouring villages are allowed to compete.—*A Village Secretary.* [We think that in this instance the number of prizes which each exhibitor gained should not be lost sight of.

The Gentlemen obtained 4 prizes each.
Amateurs ,, 1 4/10 ,,
Tradesmen ,, 1 1/4 ,,
Market Gardeners 2 3/10 ,,

This seems to give the Gentlemen a great preponderance.]

Spot on the Pelargonium.—I imagine that this arises from the effects of Green-fly. I, however, do not mean to assert that Green-fly alone produces the spot; but this, in combination with other circumstances, causes it. One of these is the want of paying attention to regularity of watering: when water is injudiciously or sparingly supplied, the result is a sickly and half-dead plant, full of spot and Green-fly. The Pelargonium requires to be regularly supplied with water when in a growing state; if the leaves are allowed to droop time after time, the cause will soon be shown by its effects. Immediately afterwards there appears upon the leaves a sort of sticky substance not unlike sugar, when dissolved and rubbed upon anything, which is injurious to the plant. In order to grow Pelargoniums to perfection, they should have a house wholly for themselves, which should be shaded with canvass, so as to exclude the mid-day sun. Air should be freely admitted, and the plants syringed every other night, when not in flower, with clean water; they should never be too much crowded together, but should be kept a good piece apart, so that air may circulate freely among them. By paying proper attention to these things there is no fear of the spot ever making its appearance. Particular attention should, however, be paid to having a free and open drainage, so that water may not stagnate about the roots. These rules I have seen practised with success in large establishments where hundreds of Pelargoniumswere grown.—*Caledonia.*

Bees.—If (p. 405) "An Old Correspondent" had aroused his Bees by rapping on the under hive, instead of leaving them to ascend into the upper one of their own accord during night, most probably they would have done so, and thus prevented the others descending into the lower hive. In uniting Bees from established hives, a little smoke from the fungus Magus(?) is very useful; it makes them quite white, so that they may be handled like Peas. I question if "C.'s" exhumed Bees were "better off than his unnatural swarm" that attacked them; if otherwise, they would have kept them off. The plan adopted to save the "persecuted Bees" might be right; but attacked hives are in general too weak to be of much use, and frequently the pillage is too far gone before it is observed. Removing the Bees beyond the flight of the invaders may be right; but others might get scent and carry off the spoil. If the treasure be an object, the best way is to smoke the Bees from the besieged hive and take it. "C." imagines that some of his Bees were "idle" because they attacked their weak neighbours, but their good store speaks other things; the additional room, if the season admit, enables them to lay up more honey. I may mention that Bees are very fond of the Salvia nemorosa, or Wood Sage. Those who cultivate flowers for Bees ought to grow this plant in abundance.—*J. Wighton.*

Ants.—The best way I know of destroying an ant's nest is by Elder-leaf tea. Boil the leaves in water, and if the tea will injure the roots of any plants, the mixture will be found quite efficacious when cold. I have lately destroyed several nests this way. Elder-tea destroys the Aphis on fruit-trees, and most likely many other insects.—*C. A. A. Lloyd.*

Ants.—In Notices to Correspondents (p. 464) it is said, "We know of no effectual remedy for these troublesome little pests." Please take Cobbett's "English Gardener," and read paragraph 299.—*Paddy.*

Rats.—Observing communications in the *Chronicle* lately, relating to destroying rats, it appears to me the great desiderata in these matters are simplicity and easy application. I therefore make no apology for stating what I have experienced to be most effectual, and combining the two above-named properties:—For the destruction of rats—An ounce of white arsenic mixed up with 3 ounces of lard, spread on slices of bread, which cut in pieces longer than broad (say about 3 inches by 1 for the convenience of putting into the holes). In every rat-hole put a piece of bread and lard, taking care to put it well down the hole, so that dogs or poultry cannot reach it. By this means I have killed thousands of rats, and those not killed desert the premises for at least six months.—*F. G. C., Aston Hall, Hawarden.*

Swans.—A correspondent, "M., Deptford," at p. 390, makes some remarks on what I had said respecting swans.—"Without being pinioned, how are they to be kept, especially in small ponds?" He classes the operation of pinioning with that of "docking, horses, dogs, &c." I hope he does not imagine that I am an advocate for cruelty to animals, when it can be avoided. There are, I suspect, many operations performed on animals for useful and legitimate purposes, that are more cruel than the practice of pinioning swans. "M." observes that swans can be kept without this, because they "have strong local attachment." But he does not say how he contrived to overcome this local attachment in the "pair of swans, which he procured in their second year unmutilated." It would have been expected that upon the principle of local attachment, they would have returned to their former home. Be that as it may, I am persuaded that pinioning is the most effectual expedient for keeping swans at home, especially on small ponds; and their beauty on the water is very little impaired by it. Where swans are kept on large streams, and belong to different proprietors, to allow them to fly must lead to worse confusion than the plan in common practice. "M." speaks of dogs attacking swans that have been pinioned. It must be a powerful dog indeed that would attack a swan in the water. But, on the other hand, if swans could fly, they would be far more likely to fall a prey to the fowler. An instance of this occurred to my own knowledge, a few years ago, near the river Wensum. A swan, which had chanced to escape pinioning, took flight in the winter, and was shot. The person who shot it affirmed that he took it for a wild swan; which was certainly a very natural mistake. I fear the like would be of frequent occurrence, if swans had liberty to use their wings. They have a great dislike to any other fowls being in their waters—even to those of their own species. But it must be borne in mind that they are not gregarious, that is, the tame sort; for the wild swans visit us in flocks from the northern regions in winter. I cannot believe, with "M." that swans kill toads, through jealousy, at the breeding season; such jealousy is to me quite incomprehensible.—*J. Wighton.*

Brugmansia parviflora.—Some of our horticultural friends may, perhaps, be glad to be told, through the medium of the *Gardeners' Chronicle*, that the plant known in our stoves as Brugmansia parviflora, or B. floribunda, is a very different genus from Brugmansia, and one that no botanist seems to be acquainted with, since the days of Ruiz and Pavon. It is strange that it should have escaped the notice of cultivators that it is the Juanulloa parasitica of Ruiz and Pavon's Flora Peruviana, vol. ii. p. 47, tab. 185. It is a "parasite," or more properly an epiphyte, "on the branches of trees, near Pozuzo, and San Antonio de Playa grande in Peru."—*W. J. Hooker, Royal Botanic Gardens, Kew.*

Covering for Frames.—Having seen many statements in the *Chronicle* respecting the advantages derived from waterproof calico for greenhouses, &c., I beg to offer the following remarks, being an eye-witness to the results. Having a Vine situated against a brick wall, and being anxious, if possible, to ripen the fruit, I determined on erecting a shed over it, in every respect similar to a greenhouse, the dimensions of which are 13 feet long, 9 feet high, and 8 feet wide, with a fall of nearly 4 feet, and covering it with calico prepared with oil, wax, and acetate of lead. The sashes are moveable, so that I can at any time regulate the temperature. In many respects I consider this preferable to glass. In the first place the condensation at the top of the house at night is so much, that the Vine always has a sufficient degree of moisture; 2dly, the light is more agreeable, and the heat is retained much longer; and, 3rdly, when the foliage is rather scanty it so shades the fruit, that on the warmest day there is not the least danger of its being injured. This building I had only erected on June 3, just as the Vine commenced blossoming, and having another Vine exposed entirely, I have been able to remark the difference. The Vine inclosed has gained so much on the other, that persons who have seen it consider the thing almost impossible, the Grapes at the present time being nearly as forward as those which have been inclosed under glass all the winter, whilst those uncovered, against the same wall, have only just commenced swelling. One thing I would recommend to those who are disposed to give it a trial, is, to avoid its coming in contact with the leaves, as they are almost certain of being scorched; I mention this, because I have seen complaints made of the foliage being blistered. In using it for protecting fruit trees I would advise that instead of having it placed within 3 inches of the tree at the top, and 12 inches at the bottom, to have it erected at double that distance from the tree.—*J. A. Spargo, Totness, Devon.*

Whitney's Composition.—No sooner does a man like Mr. Whitney invent and bring forward to public notice an article to benefit or assist those who wish to cultivate a taste for Floriculture, than we all find fault with it, and try to make a similar article a little cheaper. Many thanks, however, are due to Mr. W. for starting the plan. So great is the difference in price between a frame glazed and one covered with varnished linen, that had the inventor stated the price of varnish at double what he did, most persons would have been contented. I have tried Whitney's Composition, and also the mixture of oil, resin, and dryers, which I find equally good. I fear that many will be disappointed in its general appearance after the first winter; the excrement from birds, dust, and small pieces from the Larch, &c., have already made my roof look unsightly. I would caution those commencing, to use linen instead of calico, and to strain it remarkably tight. I have been obliged to take the linen off 12 lights, after being twice varnished, and, as I thought, finished, on account of its being too loose; whilst in my propagating pit I might fancy myself on board ship, with the sails flapping above me. My frames are 6 feet long and 3 wide, with two divisions in the length and one across; I should, however, prefer three if I covered more frames.—*G. C.*——Another correspondent writes as follows:—Seeing so many complaints in the *Chronicle* about Whitney's Composition not going so far as is stated by him, I consider it but justice to mention the following facts:—Having had nine lights of a pit to cover, each 4 feet square, I procured two pint bottles of the Composition from Mr. Whitney himself, which gave the nine lights two coats nicely. The cloth was glazed calico, at 5*d.* per yard. About six weeks ago, I had a span-roofed pit erected, having 14 lights; each light was 4 feet 6 inches long, and 4 feet 2 inches wide; the cloth was strong linen, at 8*d.* per yard. For this, I bought two quart bottles (from one of Mr. Whitney's agents), but I found that each of the bottles wanted at least one-fourth of being full; consequently it did not go so far as the first, and

the cloth likewise being thicker, absorbed more of the liquid. A good deal depends upon the quality of the cloth. The two bottles would scarcely do nine lights; I therefore got two more quart bottles (from another agent, which were quite full); one of these finished the remaining five lights, and also three more, much better than the two quarts on the nine. I, however, committed an error in using the first pint bottle. Mr. Whitney directs that it should be applied quite hot; so in making it quite hot, I must have caused it to boil; but instead of becoming thinner, it formed quite a hard substance.—*A. Threlkeld, Headingly-house, Leeds.*

Whitney's Composition.—This will not be found to stand heavy wind and rain, unless the material is thicker than the calico recommended. A frame I had covered with it has been torn in pieces, and I find others make the same complaint. During the previously dry three months nothing could answer better.—*A. R. C.*

Fixing Ammonia.—Have you ever known soot tried for this purpose? My fuel consists altogether of dried peats, and the soot, I find, destroys the offensive vapours of a small urine tank.—*Paddy.* [No doubt soot, which is chiefly charcoal, will perfectly answer the purpose, if you can get it. We have often said so.]

Hard Water.—My pump raises water unfit for many domestic purposes; soap is curdled by it, and vessels in which it is boiled are coated over by a hard substance, of a light-brown colour. Leaden pipes are, in about ten years, reduced to a rotten state. Mixed with oxalic acid, the water assumes a milky appearance, and deposits a white sediment. Can any one say what would prevent the deposit on boilers or kettles, without injuring the water for use?—*Paddy.*

Cucumbers.—A market-gardener has failed in his ridged Cucumbers these three years past. This year they looked strong and healthy from the first, until about three weeks since, when they again showed symptoms of decay. They began to droop here and there; and on pulling up the affected plants, there were no wire-worms, nor anything else visible at the roots to indicate the cause of the stems dying off. Cucumbers have been grown upon the same ridge for several years, but of course, with fresh dung and mould; and the reason for using the same place so often is, that it is protected a little by a brick wall, about 3 feet high, at the north. The soil is good and deep, and although not drained, it is not very heavy or wet. The subsoil is clay or chalk.—*Hodge.* [The disease, as above described, is of frequent occurrence. It probably arises from a want of moisture at the roots.]

Chiswick Exhibition.—An error has crept into the report of the Exhibition of the 13th, which I cannot allow to pass unnoticed. It is stated that "Mr. Rowland also contributed Roses, but they were overblown; and the collection contained no remarkable kinds." This is a very great mistake; and I can positively assert that there was not one Rose overblown in the whole collection, which was at the time very much admired, particularly the Devoniensis, Smith's Yellow Noisette, Prince Albert, Luxembourg, Charles Duval, Adam, &c.; and for which collection the Large Silver Medal was awarded. So far from the Roses being overblown, the whole that were exhibited remained in the same boxes several days before one flower dropped, which can be testified by several Amateurs who happened to visit my garden.—*Alexander Rowland, F.H.S., Rosenthal, Lewisham.*

Ancient Charcoal.—Some time ago when a person was digging peat he came upon a quantity of charcoal; the peat was upwards of eight feet deep, and the charcoal was found about four feet from the surface. One naturally inquires how old it may be, and when the fire was kindled that charred the wood? Could it be by our naked ancestors, or those who came to conquer them? It is said that the Emperor Severus gave orders to cut all the forests in Scotland; or perhaps it was done by the followers of John Duke of Lancaster, when he set 24,000 axes to work to cut down the Caledonian woods. Not far from where the charcoal was found there is an embankment which goes by the name of the Roman Camp; and at the base of the hill upon which it is situated there is part of the line of an old Roman road. It is well known that Roman coins and Roman vessels are found in peat that is much deeper than four feet; but it is difficult to ascertain the age of peat by its thickness, for peat only two feet thick may be as old as that which is twelve feet thick; and we may not be very far wrong if we say that the age of the charcoal may be 1500 or 1600 years. I have sent you a small portion of it for your inspection; you will observe that it wants the jet-black appearance of well-made charcoal; this is perhaps owing to the colouring matter of the peat in which it had been so long soaked. [The charcoal had been prepared from Fir-wood.] Can it be ascertained by the Pine wood that is found in peat if it belongs to the same species that at present goes by the name of Scotch Fir, Pinus sylvestris? From the quantity of rosin that is obtained from the wood that is got in peat some imagine that it belongs to a different species. Some time ago a Pine trunk that was found in peat was cross cut, and exhibited rather an uncommon appearance when smoothed by the plane; there was seen five series of concentric circles, the largest series containing between 80 and 90 circles; they appear to be all perfectly united to each other, except at some places where traces of bark are seen; the diameter of the trunk measures in one way about 14 inches and the other 9 inches. May we suppose it to have been a stunted tree, or the seasons to have been warmer than they are now? The growth of 1826 can be easily pointed out in cut timber, being well known from the small quantity of wood it contains.—*Peter Mackenzie.* [All we can say, after the examination of the charcoal, is that it has been prepared from Fir-wood, but whether it was Pinus sylvestris or not is uncertain. We do not perceive any difference.]

Water Colour from the Cactus.—(See p. 247, 1844.)—The Opuntia, whose juice is used for painting in Sicily, has long been known for that purpose at Naples. It is not vulgaris, humilis, Ficus indica, Amycloea, or, in short, what is commonly called the Prickly Pear, but a scarce and more tender species, which I have never seen in any English collection of Cacti. It is Opuntia Tuna, a fine plant, a great bearer of yellow flowers and a fruit of the richest carmine, not purple.—*W. F. S.*

Vegetable Dyes.—The roots of the Epine Vinette, which I take to be the common Berberry, is used in large quantities in France and Germany by the dyers, who extract from it a most brilliant green. The expense of transit, together with the difficulty of obtaining it fresh, prevents its use here; but the price which our dyers could give for it (from 10*s.* to 16*s.* per cwt.), might induce proprietors of large plantations to cultivate it as underwood. Would not the root of the Berberis aquifolium answer equally well?—*J. G., Tulse Hill.* [Common Berberry is the best.]

Ice-houses.—"A. E. W." wrote, in No. 8, *Gardeners' Chronicle*, that a Virginian, with some poles and straw, will construct an ice-house for 10 dollars as good, if not better, than those which cost our men of taste as many scores of pounds. Cobbett, of old, wrote to the same effect, and promised to give the full particulars, so that any countryman should be able to erect it, for the benefit and luxury of himself and his village neighbours; but I believe Cobbett never fulfilled that promise. Is there not among your readers a good-hearted Virginian that will give us this desirable information, in such a clear manner that we could work thereby with a fair prospect of success?—the first consideration being economy in cost. A person having an unused Mushroom-house, on a retentive soil, would, I fancy, find himself much disappointed if he adopted the recommendation of "A. E. W.," without putting in some drains to get rid of the water as it sinks into the broken-up earth; and if "A. E. W." be successful, it more than likely arises from his house being on a gravelly subsoil, which forms a natural and perfect drain.—*H. S.*

Morphology.—The interesting articles on Morphology that appear, from time to time, in the *Chronicle* will induce people to look more attentively at vegetation than they were formerly accustomed to do; even those who had a little "smattering" of botany will look upon their old acquaintance in a new aspect. In a Scotch Fir-tree we commonly find a centre shoot and five or six side ones; but, where a cone is produced, there is a shoot deficient, there being only four or five side ones. I found, what I considered to be a remarkable coincidence, between the pips of the cone and the leaves of the side-shoots; the number of pips was 62, and the number of pairs of leaves on a shoot beside the cone was 64. Is this an instance of leaves being turned into fruit, or seed-vessels? The male blossoms of the same plant are commonly on weak shoots, which have not half the quantity of leaves on them that the more healthy shoots have. I found 30 pairs of leaves on those that I examined, and 20 bundles of male blossom, with 10 or 12 pairs of leaves above them, on the same shoot.—*Peter Mackenzie.*

Vegetable Phenomenon.—I beg to relate a circumstance which occurred to a Pelargonium. One of these plants, on which no flower had then opened, had been with others placed in an airy hall; the expansion of this occurred on the morning of the 6th day, when I was surprised at its altered appearance, every petal having become white and transparent as the clearest gauze, with the exception of a border of the colouring matter the sixteenth of an inch wide; the three lower petals were of a pale pink; the two others of a deeper colour; every blossom in succession did the same, and by constant inspection I found the transparency of each remained about five days; after which, in the same succession, the colour of all was restored with the freshness of newly-opened flowers. The case being so extraordinary it had my particular attention, which enables me to say you may strictly rely on my statement. My son not being at home during this time I dried some for his inspection, and this brought back the colour. This plant, I assure you, was the wonder and admiration of the many who saw it; particular care was taken of this plant, which I desired should remain untouched till the following summer, but no more of these changes have appeared since.—*E. B. Paington.*

Curious Growth of a Scotch Fir.—In the *Chronicle*, p. 574, 1842, there is a notice of a Scotch Fir-tree whose growth was somewhat remarkable; this year it is still more so. The leading shoot, and also the side shoots, started in the spring to all appearance like their neighbours, and continued to grow as on other trees of the same kind until the leader was about 4 inches long; when the side buds on the top, instead of remaining buds until the next spring, grew into branches. A leading shoot was again formed, which grew about 6 inches more, when the side buds a third time grew into branches, which are at present about 2 inches long.—*Peter Mackenzie.*

Myrtles.—Two years since I planted in my shrubbery two broad-leaved Myrtles. They face the east, and my house stands on one of the highest summits of the Chiltern Hills, South Bucks; they have stood the two last winters without any shelter or covering. A severe frost late in the last spring destroyed most of the leaves on one of them, but it has renewed its foliage and is healthy.—*J. Peers.*

Asparagus.—I have half a dozen beds of Asparagus, two years old, from seed; they were sowed in rows one foot apart, and the seeds set one foot apart in the rows: there has not been a single failure. I have given salt in pretty large quantity, and the plants are very strong, each root having five or six shoots. I fancy I should take out every other plant in the rows, leaving each two feet apart; before I do this I should be glad of your opinion, and if you confirm my idea, whether I should do it now or next season, a reply in the *Chronicle* will oblige your subscriber. [We should not disturb the roots. If the beds are well manured, the plants are not too many.] I think I have fairly tried salt, for the beds on which I have used it, now in the second year from sowing, produce from each root five to seven shoots; whilst those sowed with the same seed, at the same time, and side by side, are generally weaker in growth, and put forth two to three shoots only.—*J. G. B.*

Manures.—*Hibernicus* states that last year (spring of 1843) he manured three beds, each containing about 150 plants of Myatt's (Pine Strawberry); 1, with nitrate of soda; 2, with guano; and 3, with bone-dust. He remarked no difference in produce last year; but this year, the one to which the bone-dust was applied is much the best.

Foreign Correspondence.

Canton, Feb. 17, 1844.—The Chinese here are now making great preparations for the celebration of their new year, which takes place to morrow. Flowers of all kinds are in great request amongst the inhabitants, who employ them in the decoration of their dwelling-houses and temples. In going up the river towards the Fatee Gardens, I met boats in great numbers loaded with the branches of Peach and Plum-trees in bloom, Enkianthus quinqueflora, Camellias, Cockscombs, Magnolias, and various other things which flower at this season. The Enkianthus is brought down from the hills with the buds just expanding; and after being placed in water for a day or two, the flowers come out as healthy and fresh as if the branches had not been removed from the parent tree. This plant is a great favourite amongst the Chinese. The common Jonquil too comes in for a most extensive share of patronage; and in the streets of Canton one meets with thousands of bulbs growing in small pans amongst water and a few white stones. In this case the Chinese exhibit their peculiar propensity for dwarf and monstrous growth, by planting the bulbs upside down, and making the plants and flowers assume curious twisted forms, which are most agreeable to the eyes of a Chinaman. Large quantities of all these flowers are exposed for sale in many of the shops and in the corners of the streets in Canton, where they seem to be eagerly bought up by the Chinese, who consider them quite indispensable at this particular season. Not only are the houses and temples decorated, but the boats on the river also come in for a most extensive share. Indeed, these boats are only floating houses; for, as you know, a very great part of the population of Canton lives upon the river. The flower-boats, as they are commonly called, are particularly gay at New-year time with flowers of all hues, and gaudy flags streaming from their mast and stern. The crackers, or fireworks, of which the Chinaman is so fond, are let off in large quantities for several days in all parts of the town, and form part of their religious ceremonies or offerings to their gods. Their shops are closed on New-year's day, and for two or three days afterwards. The greater part of the natives have now on their holiday-clothes, and tramp about amongst their relations and friends to chin-chin them, and wish them a happy new-year, as we do at home. Large parties are made at this season to go up to the gardens at Fatee; and on particular days, you find there hundreds of these flower-boats crowded with well-dressed young Chinese, enjoying themselves as our own population do at Richmond or Hampton Court at home. This is the only season when well-dressed ladies are visible at Canton, as they now go over to Fatee in the flower-boats, and walk about in the gardens.—*R. F.*
